Clinical Lectures

DELIVERED AT

CHARING CROSS HOSPITAL.

BY

HYDE SALTER, M.D., F.R.S.,

FELLOW OF THE ROYAL COLLEGE OF PHYSICIANS; LECTURER ON
PHYSIOLOGY AND PATHOLOGY AT CHARING CROSS
HOSPITAL MEDICAL SCHOOL; AND ASSISTANT-
PHYSICIAN TO THE HOSPITAL.

LECTURE IX.—ON ŒSOPHAGEAL DYSPHAGIA.

Narrative of Case. Analysis of Symptoms. Serial Examination of the Alternatives of the Diagnosis. Prognosis. Treatment:—Feeding; Indications of Local Treatment; Importance of avoiding Mechanical Interference.

GENTLEMEN,—Some short time ago, we had an opportunity of observing some cases of what I call tracheal dysphagia—difficulty of swallowing depending on inflammation of the mucous membrane of the windpipe—and I made them the subject of a lecture to you. I wish to-day to offer you some remarks on a case of dysphagia very different from these, which illustrates very well the principles of the diagnosis of these cases, and which is interesting to us not only intrinsically, but from the strong contrast which it offers, both in the symptoms and the prognosis, to the cases which were the subject of my former lecture:—those cases were transient, this is permanent; those were functional, this is organic; those were affections of a respiratory organ, this of an alimentary; those patients all recovered, this man will die.

Henry Norris, aged 50, by occupation a commercial traveller, temperate in his habits, had venereal disease twenty years ago. Up to April of this year, 1864, his health was perfectly good; at that date he suffered from what he calls scurvy—purpura of the legs (which were all the colours of the rainbow, especially purple), profuse epistaxis, and bleeding from the month, throat, and gums, which were very tender; the gums, he says, came entirely away from the teeth. In this condition he entered one of our Metropolitan hospitals, and was under treatment for five weeks, when he left free from all his symptoms. His doctors attributed them to want of vegetable food, and the man himself thinks that want of nourishment, and general privation, may have had a great deal to do with producing them.

Previous to leaving the hospital, now eight or nine weeks ago, he called the attention of the physician who was treating him for the scurvy to a pain that he experienced on swallowing, which he then felt for the first time in his life. It was situated then, and has

been ever since, beneath the lower part of the sternum, and was felt as each mouthful passed or reached the spot, and only then. On making oral and pharyngeal deglutition there was no pain, and a distinct interval elapsed before the pain was felt; moreover as soon as the mouthful of food had passed the spot the pain ceased, and he would feel no more of it; so that he experienced at a meal as many independent attacks of pain as he swallowed mouthfuls, and as soon as the meal was over was perfectly free from pain. He describes the pain "as if there was a dreadful sore place, and something hard was pressing on the raw skin; as if it was tearing his flesh from him." At that time it did not shoot through to the back, but for the last few days it has. I said just now the pain was felt as each mouthful "passed or reached" the spot, and I said "passed or reached" because sometimes it reached it without passing it, but came up again into the month, generally immediately, one mouthful coming up before the next was swallowed; sometimes, however, a mouthful, or even two, or three, or four, one after another, would stop and lodge at the painful part, and then all come up together. He knew when this was taking place from the continuity of the pain, which was not in this case transitory as when the food passed, or was returned at once. Whether the pain was as severe when he first felt it as it has been since, he cannot remember, but he is sure that within three or four days of its commencement it was extremely severe—as bad, he thinks, as it has been since. He felt it most at breakfast (and so indeed he does now), and it is at breakfast that the food stops and comes back again most. He will sit down to his breakfast feeling perfectly well, with only a slight sensation, as of indigestion, beneath the bottom of the sternum, and commence eating, but the moment the first mouthful reaches the part affected the pain is felt in all its severity, and the mouthful probably comes up. He swallows another and that comes up, and another and that comes up, and so on. At first, after a certain number of mouthfuls had thus come up in succession, sometimes as few as six mouthfuls, he would suddenly swallow perfectly easily, without any pain, and with no return of food. Sometimes, however, it would be a dozen or twenty mouthfuls that would thus return, and on one occasion as much as two whole pieces of toast thus came up in successive mouthfuls, and after that the swallowing was perfectly easy, and he made a hearty breakfast. Of late, however, for the last five or six weeks, the pain has been so great and the return of the food so uniform, that after persevering in swallowing for some time he has given it up in despair, and abandoned his meal. At the first part of the case, when the commencement only of breakfast was painful, the subsequent meals, dinner and tea, would be free from pain, and have no return of food; of late, however, the subsequent meals have been nearly as bad as the breakfast, but never quite. Thus, it was the first meal of the day that was the worst, and the first part of each meal. On the whole it is clear that the state of things has been getting progressively worse, and for the last four or five weeks he has hardly got any solid down.

As a result of this he is rapidly getting weaker, and is now extremely feeble and thin. In dressing in the morning he is obliged to sit down and rest himself, and in walking is often compelled to sit on a doorstep. The slightest exertion makes him break into a perspiration. He is constantly hungry though he dares not eat.

As he sits by me, while I am taking notes of his case, I hear from time to time—every three or four minutes—a peculiar glutching noise, which seems neither so high as the throat nor so low as the stomach; he says it is quite involuntary, and that he frequently notices it, and that when it occurs, it is a warning to him that the passage is free. He refers the sensation that accompanies it to the sternum.

On seeing him for the first time, among the out-patients, I introduced a probang which I passed down three or four inches into the œsophagus, and then I could get it no further, whether from some obstructing material, or from the resistance of the œsophagus itself, I cannot tell; but the œsophagus gripped the sponge so firmly that I had great difficulty in getting it back again. It evidently caused the patient great distress, and the pain it produced lasted for some minutes afterwards.

On the day before he saw me, he brought up, for the first time, a piece of blood, in the form of a clot, as big as the end of his finger. On the morning of the next day (the day that I saw him) when washing, as he stooped his head to the basin, a still larger piece came into his mouth, black and clotted like the other. In the evening of the same day, a much larger piece came up, in the form of a cylindrical clot, as long as his middle finger, and about the same size, and I think there can be no doubt that it was moulded in the œsophagus. Whether it was the result of the violence done to the œsophagus in introducing the probang, I cannot tell; the man himself thinks it was.

On Tuesday, October 25th, three days after the above notes were taken, this patient was admitted, as an in-patient, into the hospital. I placed him immediately upon a liquid diet, to see what the effect of that would be, and the result was that he got nearly the whole of it down. I gave him in the course of the day two extra pints of milk, four eggs beaten up with it, beef-tea, and a custard. Some portions of it were returned, but the chief part passed, and, as a consequence, the man decidedly gained strength. Before, on a solid food, he was starving—now, on a liquid food, he was fairly nourished. On the day that he was admitted, a small clot of blood was raised: three days afterwards, a considerable clot of the old shape rose into the mouth and was expectorated, and the next day another was shewn me. This was on Saturday, October 29th; and, as the patient was shewing it to me, he remarked that he was sure he had another on his chest, for he could feel it there. I had not left the ward a minute, before I was called back to see a large clot, of the same shape as before, and about three inches long, that had just come up. With the view of stopping the bleeding, I then ordered him five minims of dilute sulphuric acid and twenty grains of kino powder, in a teaspoonful of mucilage, to be swallowed every four hours. From that time to this, now twelve days, no blood has appeared.

For the first four or five days, our patient swallowed, as I have mentioned, wonderfully better, apparently in consequence of taking nothing but liquid food, and, as a result, daily gained strength and improved in appearance; but for the last week the swallowing has been gradually getting back into the old condition—less and less has been got down, and now hardly anything passes, although nothing is

attempted to be swallowed but fluids. There is, however, the same irregularity in this respect as there has been all along; and last night, after every previous meal in the day had, mouthful by mouthful, been returned, he swallowed a basin of arrowroot perfectly well, without the slightest pain or the slightest obstruction.

For the last four or five days, he has experienced a constant pain in the back, just between his scapulae, corresponding to the spaces of the sixth and seventh dorsal vertebrae. He is decidedly losing strength day by day, and is much weaker than he was ten days ago.

Such, then, is the history of this case up to the present time. To-morrow, the man, by his own wish, leaves the hospital; and I was anxious, before he went, to make some observations upon his symptoms: for in many points they are highly interesting and instructive.

The four principal symptoms which we find are:

- a. Pain on taking food, of a particular kind, at a particular place, and occurring at a particular time.
- b. Obstruction to the passage of food.
- c. Return of the food into the mouth after having been swallowed, and without vomiting.
- d. Hæmorrhage—the raising of clots of blood of a particular shape, without vomiting, and without cough.

Now, let us see if, out of these four symptoms, we can construct a diagnosis. It is in relation to diagnosis that the case is chiefly interesting; it affords a very good example of the way in which symptoms are mutually corrective; of the way in which they eliminate, one by one, the alternatives that suggest themselves, and contribute, each its mite, to the construction of the only true and tenable hypothesis.

Our first impression on seeing this man among the out-patients was that he was suffering from ulcer of the stomach. The symptoms that he complained of were—pain on taking food, the pain coming on immediately on taking the food; return of food; and the bringing up of blood, evidently not coming from the lungs. If one were asked what were the most suggestive symptoms of ulcer of the stomach, one would probably mention these four. And it is evident that the physicians of ——— Hospital, under whose care he was, men of great ability and one of them having a special reputation for a class of diseases under which this man's case would fall, were under the impression that his trouble was gastric; for one of them ordered him a mixture containing rhubarb, and the other added to this bismuth. A very slight extension of our inquiry, however, sufficed to show us that this could not be the case. The circumstance that corrected this impression was, that each mouthful the moment after it was swallowed caused an individual access of pain, and that the pain was transitory—the end of the swallowing of the meal being the end of his sufferings, and the digestion of it, from its very commencement, unattended by any pain whatever. I do not mean to say that it is absolutely certain that these features of the pain shew that the seat of it *must* have been in the œsophagus and *could not* have been in the stomach: for it is just possible to conceive that a gastric ulcer just within the œsophageal orifice might give rise to a momentary pain as each mouthful, passing over it, entered the stomach, and

that at the same time it might be sufficiently out of the way not to be irritated by the general contents of the stomach during digestion. But if it is possible to entertain such an hypothesis, the supposition is immediately corrected by another circumstance, and that is, that the individual mouthfuls were returned again to the mouth without any act of vomiting. Now, if the food had entered the stomach, it must have been returned *by* the stomach—in other words, by an act of vomiting; but this, in fact, never occurred—the man never *did* vomit. It is clear, then, that the food never reached the stomach; and if it never reached the stomach, the seat of the pain that it caused could not have been *in* the stomach.

But there was another circumstance that the subsequent history of the case furnished, that to my mind clearly shewed that the mischief was oesophageal, and that is, the shape of the clots of blood that were from time to time raised. These were cylindrical and all alike, of just such a shape as one can imagine moulded in the oesophagus, and not such a shape as one can imagine moulded in the stomach. They were all of the same calibre, though not of the same length; and on looking at them, one could not resist the impression that they were moulded in a tube. Now, if these clots were formed in the oesophagus, the question of the seat of the disease is settled; for they not only shew where the blood was poured out, but, I think also, that there existed below the point in the oesophagus where the blood was effused such an obstruction as prevented it from passing down at once into the stomach.

The disease, then, having been determined to be oesophageal, what was it? Was it simple spasmodic stricture? Was the obstruction due to some pressure from without? Was it simple organic stricture, such as that which results from the slow contraction of old cicatrix? Was it due to aortic aneurism? Was it ulceration of some kind? and if so, what?

Let us now take these different hypotheses in succession, and test them by the symptoms, and see how they respectively bear the examination.

1. Was it simple spasmodic stricture? This hypothesis would be perfectly consistent with the pain, with the obstruction, and with the return of the food; but there is one symptom that it would not be consistent with, and that is the hæmorrhage. You may have spasmodic stricture *with* hæmorrhage, but you must have something *more* than spasmodic stricture.

2. Was it due to pressure of something from without, as of a tumour in the posterior mediastinum? Against this hypothesis would be ranged, not only the hæmorrhage, but the intermittent character of the symptoms—their severity at one time and absence at another. Such a cause as external pressure is what mathematicians would call “a constant”, and therefore cannot give rise to an inconstant result. There was, moreover, the negative evidence of an entire absence of all the signs of tumour.

3. Against the supposition of simple organic stricture, without any lesion beyond the organic narrowing—such a narrowing as would be the slow and gradual result of swallowing some corrosive poison, such as vitriol or caustic alkali—I think the objections are almost equally strong. Unless such organic stricture were very slight, and largely suppl-

mented by spasmodic contraction, it would not be compatible with the occasional almost perfect freedom of deglutition; moreover, we should be here again met with the difficulty of the blood.

4. Was it aneurism? This was the first thing I thought of after I gave up the idea of ulcer of the stomach, and I think it is that which would be suggested, and reasonably so, to any one examining such a case as this. Indeed, I think one might broadly state that dysphagia, apparently organic and attended with considerable bleeding into the oesophagus, would point rather to aneurism than to anything else. At any rate, aneurism was what we did think of, and what we tried to find evidence of. But beyond the dysphagia and the blood, there was nothing to support it. There was no aneurismal *bruit*, no impulse, no percussion-dulness, no dyspnoea, no aneurismal cough, no stridor of voice or aphonia, no inequality of pulse or of pupil. The question then is, whether the symptoms present, in spite of all this negative evidence, were sufficient to prove the existence of aneurism. There can be no doubt, I think, that they were not. And besides, there are these two points, which the subsequent history of the case developed, dead against the aneurism hypothesis—one, that if the bleeding had been aneurismal, it would not have attained the extent that it did without having attained a much greater extent, would not have ceased, as it apparently has, but would probably have speedily become profuse, ungovernable, and fatal; the other, that it would not have yielded to the treatment to which it apparently did yield—the kino and sulphuric acid. You will remember that from the day the man took these styptics the bleeding ceased, although continuing freely up to that time.

5. We come now to the only remaining supposition that the symptoms were due to some organic intraoesophageal lesion, producing at once obstruction and hæmorrhage—obstruction compatible with occasional freedom of passage, and intermittent hæmorrhage. If we suppose, in addition to this, that the organic disease produced occasional spasmodic stricture, or that it was of such a nature as occasionally to block the passage and occasionally not, and that it has been gradually increasing since it first gave signs of its existence, I think we shall have arrived at a diagnosis that will cover all the symptoms, and satisfy all the demands of the clinical history. The point in the history of the case that seems the least compatible with organic disease, is the freedom with which swallowing would be performed at one time and impassably obstructed at another. There appear to me to be two ways in which this might be explained: one, that although organic disease was present, as shewn by the blood and other circumstances, yet the principal obstruction was caused by spasmodic contraction of the oesophagus; the other, that the organic lesion was of such a nature as, by some plug or valve-like condition, at one time to obstruct the passage, and at another time not—that the intraoesophageal growth, for example, might either be pressed against the side of the oesophagus and so allow the food to pass freely, or else be driven forward into the cavity of the tube and so offer a bar to its further progress.

Without saying that the oesophagus did not spasmodically contract, I am inclined to adopt the latter of these suppositions; for one can hardly

imagine spasmodic stricture existing in full force up to some particular mouthful in a meal, and then suddenly ceasing for the rest of the meal; it seems far more reasonable to suppose that this sudden change was of a mechanical nature.

The *prognosis* of such a case is involved in the diagnosis, and is necessarily unfavourable. Organic disease of the œsophagus of such a nature as I have supposed is more likely to be malignant than not. The further increase of the disease, which has already made swallowing almost impossible, will, by and by, make it quite impossible—everything will be returned, and the man will die starved. It is possible that, before the fatal event, other symptoms may shew themselves, dependent on the extension of the disease to contiguous parts, or on the more complete destruction of the œsophageal wall. For example, the extension of the ulceration may establish a communication between the œsophagus and the windpipe, and each mouthful swallowed may be coughed up through the glottis, as happened in an interesting case which occurred in my late father's practice many years ago; or the pneumogastric nerves may be involved in the disease, or other complications may occur.

As for the *treatment* of such a case as this, there is not very much to be done. Independent of the organic nature of the affection, its very situation interposes great difficulty in its treatment; there are, however, one or two points worth mentioning.

Perhaps the most important part of the management of such cases is the *feeding* of them. The direction in which death is threatened is by inanition: the prolongation of life, therefore (which is the thing the physician always aims at when the cure of disease is impossible), is best secured, and this catastrophe longest averted, by giving the patient such a food, no matter what it may be, as he can best swallow. We saw that this man, although starving on solids, became very fairly nourished when fed exclusively on liquids. By such a method of feeding, a great deal of strength may be regained, and the patient's life considerably prolonged. When the swallowing of liquids is impossible, nothing remains but to administer nutrient enemata.

The only *direct* treatment that can be of service in such a case must manifestly be local—no general treatment could possibly be of service in organic lesion of this nature. Now, there is a special difficulty in treating disease of the œsophagus *locally*. You may easily treat locally any part where there is naturally a delay of that which is applied to it, or is introduced into it. You may treat the mouth locally, you may treat the stomach locally, you may treat the rectum locally, you may, by inhalation, treat the air-passages locally; but to treat locally a part which merely transmits is very difficult—next to impossible. If you administer anything in any considerable quantity, it simply passes on. The only way to obviate this difficulty is to give the remedy in a quantity so small that it shall reach, and only *just* reach, the affected part, and not be passed beyond it. This is what I endeavoured to do; moreover, I endeavour to give it of such consistence as would be likely to adhere to the surface over which it passed. The limitation of quantity has, however, the disadvantage of limiting the dose of the remedy: for the application must not be stronger or more concentrated than the mouth will bear. This is why I was only able to give five minims of the sul-

phuric acid in the kino and mucilage I administered to arrest the hæmorrhage; for the quantity being, for the reason I have mentioned, limited to a teaspoonful, the amount of acid was also necessarily limited, or else it would have been too strong to have been comfortably swallowed. Five minims to the teaspoonful is forty minims to the fluid-ounce, and that, I think, is quite strong enough.

The objects to be aimed at in the local treatment of such cases are—the arrest of hæmorrhage and the diminution of the sensibility and irritability of the part. The former I endeavoured to achieve, and apparently *did* achieve, by the compound kino powder and acid in mucilage; the latter I succeeded in a great degree in compassing by a bolus of conium and hyoscyamus with a little opium. I must say, with regard to this last, that the disease itself made a local treatment possible that would otherwise have been very difficult, for the bolus was delayed, as I thought it would be, at the diseased part, and was gradually dissolved there, and exercised on it its full sedative influence. This was shewn by the fact that, after the bolus had been swallowed some hours, dissolved particles of it would rise to the mouth.

In conclusion, I have only one word to say in the way of warning: be very careful how you make exploratory examinations in such cases; be very chary of thrusting down probangs, or attempting to feed by the stomach-pump. The chance of getting additional information may be dearly purchased. In this case, the use of the probang appeared to be followed by an increase of the bleeding. But far worse than this might have happened—the instrument introduced might have been passed through the diseased wall of the œsophagus into the windpipe. This is no doubt what would have happened in the case that I have already referred to, that occurred in my father's practice; and this is what actually *has* happened. Nay, more than this, in attempting to feed with the stomach-pump a patient suffering from organic disease of the œsophagus, a surgeon has pumped a basin of gruel into his lungs, and killed him then and there. I say, then, beware of meddling too much with such cases in the way of exploration.

BUST TO DR. CORRIGAN. On the retirement of Dr. Corrigan from the office of President of the King and Queen's College of Physicians, it was resolved, at a meeting of the College, that a portrait of him, to be provided for out of the corporate funds, should be placed in the hall of the College, with a suitable inscription. It was further resolved, that a subscription should be inaugurated amongst the Fellows and Licentiates for the execution of a bust of Dr. Corrigan in marble. This movement was at first strictly confined to the members of the College, from whom, within a very short period, a sum considerably larger than would be required for a bust was procured. It was subsequently intimated that a very general desire existed on the part of the profession, as well as of the public, to contribute to this testimonial. The Honorary Secretary has been, therefore, authorised to receive the subscriptions of all persons who may desire to contribute, with the view of substituting for the bust originally contemplated, a marble statue by Mr. Foley, R.A., to be placed in the hall of the College, along with that of the late Sir Henry Marsh. Subscriptions may be forwarded to Dr. Lyons, 8, Merrion Square West, Dublin.

HOSPITAL PRACTICE:

METROPOLITAN AND PROVINCIAL.

HULL GENERAL INFIRMARY.

TUMOUR OF THYROID GLAND: TRACHEOTOMY: DEATH.

Under the care of K. KING, M.D.

DAVID BLACKBURN, aged 22, was admitted Oct. 12th, 1864. In front of the trachea, and connected apparently with the isthmus of the thyroid gland, was a prominent swelling as large as a hen's egg, which moved during deglutition, and was not painful, the skin covering it being quite natural. There was also considerable fulness of the lateral lobes of the thyroid, most marked on the right side. Breathing was very difficult, prolonged, and stridulous; and the patient spoke and coughed with difficulty, the cough having also a croupal character. In other respects, he was quite well. The swelling had been gradually coming on for three years. He was ordered to take five grains of iodide of potassium three times a day.

Oct. 22nd. There was no improvement. Ointment of biniodide of mercury was ordered to be applied occasionally.

Nov. 2nd. Breathing was more impeded; the lips were quite dusky; and he lay with his head thrown back. The skin of the neck was very sore, from the application of the ointment.

Nov. 5th. He was now much improved again, and quite as well as when admitted.

Nov. 12th, 10 P.M. During the last few hours, he became considerably worse, and he now drew his breath with great difficulty.

Nov. 13th, 2 A.M. He was becoming quite livid and insensible. An incision was made in the mesial line over the tumour, which was removed, and proved quite distinct from the thyroid gland; it was globular in form, and had a firm fibrous covering. The trachea was thus left freely exposed, but lying at the bottom of a deep wound. There was free hæmorrhage from the vessels which supplied the tumour; and these were tied *en masse* by a double ligature passed through them. The breathing seemed somewhat relieved by this, though still stridulous; but, after waiting two hours, as there was still great lividity and a failing pulse, an incision was made into the trachea, and a large tube inserted.

After this, he improved, and soon breathed with more ease than he had done for months; his pulse recovered itself, and he took milk and brandy freely.

Nov. 14th. Some muco-purulent and bloody matter was expectorated through the tube. Breathing was tolerably easy, and the pulse good. Milk and brandy were taken freely; and beef-tea was given as an injection.

Nov. 15th. Breathing was much more difficult all the early morning, and a great deal of muco-purulent matter was ejected. He continued to become worse, and died at 9 A.M.

AUTOPSY. The thyroid gland was apparently much enlarged, each lateral lobe being about five inches in length, and marked out into lobules on the surface. On section, the mass was seen to consist of separate cysts and solid tumours, varying in size from a nut

to a walnut; the contents of the cysts varied from a black treacly fluid to a clearer gelatinous fluid, and the solid tumours approached to soft cancer in appearance. Besides and behind these was the true substance of the thyroid gland, proportionally very small. The separate tumour, which was removed, had all the characters of the tumour just described, but was anatomically quite distinct from it. The trachea and larger bronchi were quite filled with muco-purulent fluid, which welled up from the divided bronchi when the lung-tissue was compressed. Several microscopists examined the tumours, but could not find evidence of malignancy.

FRACTURED RIBS: GENERAL EMPHYSEMA: RECOVERY.

Under the care of K. KING, M.D.

Peter Murphy, aged 51, was admitted August 8th, at 3 P.M. He was a stoutly built man, having a bloated appearance, the face and trunk being much swollen, and crepitating all over on pressure. The face was congested; the lips dusky; he had two black eyes, and numerous bruises. His breathing was short, but not much distressed, as he was able to walk upstairs; he had a constant short cough, but very little expectoration, and that a clear mucus; pulse 76, feeble. Two days previously, he had been beaten by some fellow labourers, when he had some ribs fractured, and soon afterwards began to swell and suffer from shortness of breath; but he had no spitting of blood.

7 P.M. The swelling had increased, and his breathing was very hurried and shallow; complexion more livid; and pulse feeble. Five incisions, about an inch long, were made into the cellular tissue over the front of the chest; air rushed out with a hissing noise, and he was soon much relieved in every respect. He was ordered to take a fourth of a grain of tartarised antimony every four hours.

Aug. 9th, 2 A.M. He was very much distressed, and unable to lie down; breathing with great difficulty; the emphysema and lividity had again increased. Three more incisions were made, and the others enlarged.

8 A.M. The skin was less tense, but crepitated everywhere, even down to the fingers. His breathing was easier; there was still much congestion; pulse 70, with more power. The mixture was omitted. He was ordered to have half a grain of calomel and a fourth of a grain of opium every four hours.

Aug. 10th. He was decidedly better; the skin was soft, but crepitating all over; breathing quiet; lips less congested. He could lie down, and had slept a little; there was scarcely any cough.

Aug. 13th. He was very comfortable. The crepitation was as marked over the trunk, but less so upon the extremities. The wounds were rather sloughy. He took his food, and slept pretty well.

Aug. 20th. The emphysema had altogether disappeared; but he had still some cough. A bandage was applied to the chest.

Sept. 2nd. He was discharged quite well.

GUNSHOT WOUND OF THE CHEST, FATAL.

Under the care of K. KING, M.D.

Jas. Layton, aged 22, was admitted November 22nd, at 9 A.M. One hour previously, whilst dragging a gun through a hedge by the muzzle, it went off, and the charge entered his chest. His flannel shirt was very bloody, and had a large hole in it; and a bandage had been applied round the chest by a surgeon before admission. On the right side, there was a ragged wound as large as a five-shilling piece over the cartilages of the seventh and eighth ribs, which

were fractured; and there was a hole admitting of the passage of two fingers into the pleural cavity, through which air passed audibly during respiration. There was very little hæmorrhage externally; and neither cough, nor hæmoptysis, nor emphysema. His breathing was hurried and catching, and his voice very feeble; pulse 120. No air entered the right lung in front; but some vesicular murmur was to be heard over the scapula. On examining the wound with the finger, a piece of costal cartilage, half an inch long, was felt loose, and removed; also several small pieces of lead and small shot, and some shreds of flannel shirt. The wound was then closed with hare-lip pins; and the side of the chest strapped, as for fractured ribs. He lay on his right side, and was very thirsty.

7 P.M. He had vomited three times during the last hour, but was much the same in other respects. He was ordered to take an effervescent draught occasionally.

11 P.M. He was considerably worse, and much distressed in his breathing, which was 80 in the minute. The pulse was 160, feeble, and rather irregular in force; the face much congested; lips slightly dusky. He had vomited again once. Ten ounces of blood, of a very dark colour, were drawn from the arm. This blanched the face, but did not produce marked faintness, though he was sitting up; and he expressed himself relieved.

12.30. He felt more comfortable as to his breathing, but it still numbered 80 respirations per minute; pulse 180.

2 A.M. The face was more dusky, and pulse feebler; and he was evidently worse. The lividity gradually increased, and he died at 5.30 A.M.

No post mortem examination was allowed.

COMPOUND COMMINUTED FRACTURE OF LEG, DISLOCATION OF FEMUR, AND FRACTURE OF ACROMION
PROCESS: RECOVERY.

Under the care of W. J. LUNN, M.D.

Benjamin Morton, aged 20, was admitted July 22nd, 1864. He was a railway navvy, and was engaged in making an embankment at Cherry Burton, when a mass of earth fell upon him,

The right tibia was fractured immediately above the ankle, and again two inches higher up; the fibula also was fractured two inches above the ankle; and there was a wound communicating with the fracture, from which there was some venous hæmorrhage, but no protrusion of bone. The left femur was dislocated, the head of the bone being on the foramen ovale; the limb was much elongated, everted, and incapable of adduction, but could be flexed upon the pelvis; the head of the bone was not to be felt at all, and the trochanter was two or three inches lower down than natural. There was also a transverse fracture of the left acromion process. He was a good deal depressed, and suffered much pain across the loins. A catheter was introduced, and half a pint of bloody urine drawn off.

The leg was first securely put up in a McIntyre's splint, and the dislocation of the thigh then reduced under chloroform. Extension by pulleys having been persisted in for some time, it was then suddenly discontinued, and the thigh was bent forcibly upon the trunk and towards the opposite side. After this had been repeated several times, the head of the bone passed with an audible snap into the ischiatic notch, leaving the limb considerably inverted, and capable of adduction, though still elongated. After this, the further reduction was easily effected.

He progressed rapidly, without a single bad symptom, and was discharged well on October 7th.

COMPOUND FRACTURE OF TIBIA AND FIBULA:
SECONDARY AMPUTATION: DEATH.

Under the care of W. J. LUNN, M.D.

Thos. Codd, aged 22, was admitted October 17th, with compound fracture of the left leg in its middle third. The wound was small; there was no protrusion of bone, and only slight hæmorrhage. He was walking up a plank into a cart, and carrying a sack of coals, when the plank tipped sideways, and he fell to the ground. He was a healthy man in appearance; but the heart's impulse was very excessive, and there was a loud systolic *bruit* at the apex—consequences of an attack of rheumatic fever ten years previously. The limb was put up with a McIntyre's iron splint.

Oct. 20th. There was much tension around the wound, which was painful and inflamed.

Oct. 22nd. Suppuration had set in, and the wound was increased in size by the formation of a small slough.

October 25th. He was feverish, with a dry tongue; and suffered a good deal of pain. The wound and parts near were much inflamed and sloughy. He was ordered to take an effervescent soda draught every four hours, and twenty-five minims of tincture of opium every night.

Oct. 31st. Considerable hæmorrhage had occurred from the wound, which was now filled with coagula.

Nov. 2nd. Hæmorrhage was still going on, and forcing out the coagula; but no bleeding vessel was to be seen.

Nov. 5th. Further hæmorrhage occurred. The wound was much extended in size by sloughing, caused by the pressure of the coagula. Pulse 120; tongue dry. He suffered much pain. Chloroform was given, and the leg was amputated below the knee. He bore the chloroform and operation well, and was not sick afterwards. The fracture was very oblique, and the ends of the bones were denuded of periosteum. The tissues around were sloughy, and infiltrated with pus.

Nov. 6th. He was still feverish, with a rapid and feeble pulse. Four ounces of wine were ordered.

Nov. 7th. The stump was dressed; the flaps were stuffed with coagula, but no blood was flowing.

Nov. 10th. Grumous pus was beginning to escape. There was no fresh hæmorrhage. The flaps were sloughy at the edges. Eight ounces of brandy were ordered.

Nov. 11th. The pulse was too feeble and rapid to be counted. The eyes were sunken. He retched frequently, and screamed and moaned a good deal. He was ordered to have soda-water, with five minims of tincture of opium every three hours.

Nov. 12th. He died at noon.

POST MORTEM EXAMINATION. The heart was hypertrophied, but not adherent to the pericardium. The mitral valve was much thickened, especially along the free borders, and contracted. There was no other visceral disease.

CERTIFICATES OF VACCINATION. It appears that the law, divested of its technicalities, is as follows. The registrar of births for the district, on the registering of the child, is to give to the parents a notice to have the child vaccinated within three months of its birth; when vaccination is successfully performed, the medical gentleman is in all cases to give a certificate of such successful vaccination to the parents, and to transmit a duplicate of the same forthwith to the registrar, who is to add the same to the register of birth.

Original Communications.

ON THE PHYSICS OF DISEASE, AND THE PHYSICAL PATHOLOGY OF THE BLOOD.

By BENJAMIN W. RICHARDSON, M.A., M.D., Senior
Physician to the Royal Infirmary for Diseases
of the Chest.

PREFATORY NOTE.

To the Members of the British Medical Association.

GENTLEMEN,—The following series of papers is based on a paper of which I had given notice to the Cambridge meeting, entitled “The Physical Pathology of the Blood”. Owing to the pressure of business at the meeting, the paper was only given in very brief abstract; but as many of my Fellow Associates have done me the honour to express a wish to see it *in extenso*, I have undertaken to send it to press in the columns of the JOURNAL, and have added some additional matter, which may, I trust, prove of interest. The object of the communication is to show the relationship that exists between physiology, in its more advanced form, and daily practice; and specially to simplify the structure of scientific medicine by indicating that disease, in however many types it may appear, is but one departure from a natural condition; that, in brief, as I expressed ten years ago: “Disease is an unity with a variety of phenomena; and the causes of disease are reducible to a few elementary forms.”* I shall endeavour to illustrate this more definitely than I have yet done; I shall try to show that life in its physical aspect—for I have nothing to do with metaphysics—is force developed through matter, and from that I shall strive to explain some of those changes—symptoms—diseases, if we must call them so—which follow when the expression of that force is disturbed, by reason of any change in the nutrition of the body or in the mechanism of the body. I shall thus embrace, and I think properly, under the head “physics”, every physiological act, whether that be the contraction of the heart, the circulation of blood, the oxygenation of the blood and tissues, secretion, or any other act which we are accustomed to connect with the thought of life.

Such is the outline of my plan; but ere it is opened let me crave the indulgence of the large, the critical and learned, audience to which the plan is submitted. The ground to be traversed is so new, the appearances it presents are so different to those that are left behind, and the course of description is so difficult, that every consideration must be asked with all due earnestness and confidence. I stand forth but as an explorer with one pair of eyes; and pretend not that my descriptions and inferences shall remain correct when the same objects as those upon which I have looked with the wonder of a little child who sees a new scene, shall have been investigated, dis-

cussed, and defined, by the many who follow with more ease, more knowledge, and more wisdom. I care not, in fact, if everything I say crumbles to the dust, should I succeed in drawing attention to the advanced work that is before the present generation of medical men. I have no dogmas to put forth, no opinions to offer beyond what facts support; and if I draw forth argument, why, then, as Julius Cæsar Scaliger hath it, “Sicut ignis lapidum collisione, ita ex disceptationibus elicitur veritas.”

CHAPTER I.

On Death or Temporary Inertia as the Extreme Form of Reduction of Animal Force, and on the Unity of the Process. On the Unity of Animal Force during Life, as mere Motion. On the Physical Origin of Animal Force or Motion.

ON DEATH.

When a man, or other animal, lies dead, the common voice of mankind, as if instinctively governed, expresses the fact in one reasoning sentence. You ask any number of persons why in their estimate they consider the man or the animal dead? The answer will be, “Because the body has ceased to move”; or, the involuntary movements having also ended, “Because the body has ceased to breathe.” It is a singular truth, and none the less a truth, that this common form of expression conveys, in what we now see to be the profoundest philosophy, the precise meaning of physical death; for death, in the physical aspect in which we are looking at it, is neither more nor less than temporary inertia, or cessation of motion. The force which kept the molecules of the body apart, and which enabled them to move freely on themselves, which enabled also certain of them to assume various mechanical forms and directions, is withdrawn; then the molecules, no longer separated, begin to come together, and the body not only is made powerless, but for a time rigid; and thus it remains until, by the setting up of new physical processes in which force is evolved, it is transformed into a new type of physical life.

But that which we designate as force is simple motion; it was motion that kept the molecules at true distance, that gave them flexibility, that limited their combinations with each other, and the cessation of which allowed them to come together, until the once flexible and tremulous tissues set like marble in one compact mass.

Do we want a visible demonstration of the influence of mere motion on organic particles, we have it in our hands. When the blood is in full and active motion through its vessels, before it reaches the extreme parts, the red corpuscles do not coalesce, but are held apart by the motion; we arrest that motion; we take a little of the moving blood, and let it lose motion on the microscope-slide; and the little particles, attracted by each other, at once come together and form rolls and columns. This is the effect of inertia, or death, of a drop of blood; but it carries with it the explanation of the whole physical phenomenon of death. Rigor mortis is the entirety of that process of which coalescence of blood-corpuscle is a part; it is molecular coalescence of all the body.

If we ask for a broader illustration, we have it in the very relation of our own bodies to the earth itself. By the force of gravitation, we are virtually chained to the earth; and we are enabled only to traverse its surface by the evolution of force, the motion that is evolved in us. Why is an emaciated man weak? He is coming under the influence of the earth, because he is not producing efficient motion. Why does

* See Introductory Chapter to *Journal of Public Health*, vol. i, page 2; January 1855.

a bleeding man faint and fall? He is losing motion, or resistance to gravitation; and the earth claims him. For the same reason that the gyroscope in motion does not fall, but at rest does fall, the man in full possession of motion stands erect and moves; and the man who has lost motion lies prostrate and is still. When a sick man says, "I am weak," he expresses what is little thought of, because it is so simple; he is telling, in his own words, that the earth is fixing him, drawing him to herself as to the natural home to which his body must return when the motion, or force that is antagonistic to gravitation and with which he is inspired, shall be withdrawn. Thus, the living man is constituted on the same principle as the planet on which he exists, and is to the planet what the planet is to the sun. The motion with which he is endowed is his centrifugal force, the attraction of the earth the centripetal. Between these he moves, in his cycle, until, his own motion failing, he falls into the earth, as the earth, did its motion fail, would fall into the sun.

The process of death is unity. All terms that tend to divide it into types are false, and lead away from the truth; it is simple breakage of that physico-chemical process through which motion is elicited. You may arrest the motion of a steam-engine by cutting off air from the furnace, or by taking away fuel from the surface; you may increase the force until you tear the machine to pieces; or you may work it until its parts fall out of gear; you may, *i.e.*, choke it, bleed it, tear it out, wear it out, but, in every case, you only do one of two things—you either destroy the force that moved the mechanism, or destroy the mechanism that was moved by the force. It is precisely the same with an animal, in a physical point of view; when an animal dies, it dies either because its force is not generated, or because the mechanism is unable to apply the force that is generated; in both cases, the phenomena observed is cessation of motion, with the earth, like a great magnet, seizing its prey when the motion is withdrawn.

Death is only to be considered perfect when all the molecules of the body come to rest; when but in one part or segment of the body the motion is suspended, we have local death, which we call disease; when the circulation, motion, is stopped effectually through a limb, and the limb putrefies, we see in the same body the two phenomena of life and death, *i.e.*, of motion and inertia; it is an experiment thus made, as it were, for us. I have seen the two phenomena in a more marked degree in cases of animals where the motion has been arrested by inhalation of nitrite of amyl. In these, I have seen the right heart beating when every other muscle was in rigor mortis.

ON THE UNITY OF THE ANIMAL FORCE AS MERE MOTION.

Various speculations have at different times been put forth as to the nature of the force by which the body is animated. We have heard of vital force, nerve force, heat or caloric, and electric force, and schools have actually been formed on these terms alone. The cause of difference has arisen from the fact that the so-called forces are but varied representations, real or assumed, of one force, which is simple motion. The term vital force is the mere expression for force resident in bodies that live; in no other sense has it any meaning. It were in truth as well to speak of the decomposition of a dead body as the mortal or dead force, as it is to speak of the movements of a living body as the vital or live force. To imagine that there is in animal bodies any physical force other than pertains to all else in nature is beyond reason superstitious and absurd. What moves

man moves the planet; and what moves the planet moves the sun; and what moves the sun moves all the infinite systems of suns and worlds in their courses. We cannot isolate an animal and break the immortal chain of life and being for the mere amusement of speculation about a special force in animals, as though an animal were not a part of the great whole of the universe, or as though a world in motion were not as much alive as a caterpillar or a moss. Impossible! We may then dismiss vital force as a human term to express the force, whatever that force may be, of an animal or vegetable body, because the force is shewn from or through the animal, not because it is itself specific and is not elsewhere.

We may dismiss the hypothesis of nerve-force on similar grounds; we might as well talk of blood-force or muscle-force as of nerve-force. It is true that force may be exhibited through nervous structure; but to isolate such force and say that it is specific or a peculiar force, is even worse than to speak of vital force in the same terms, because it is a more limited form of expression. When, however, we speak of heat-force, electric force, light-force, or pure mechanical force, we arrive at something more tangible, but we do not arrive at different forces; we meet only with one force—motion developing itself through matter, and seeming only to develop itself differently in its unity, because the matter through which it is developed is physically different. In the body we see motion in various forms. Primarily, in so far as the vegetative life is concerned, we have the motion eliminated by the oxidation of blood, which motion we call heat; again, we have motion eliminated through the nervous organism; next, we have it through light entering by the eye; and once more we have it as pure mechanical motion, in the vibrations of the tympanum when sound is produced, and in the excitation of the surfaces of the body, when the nerve filaments are set in action and sensation is produced. But when all these developments or representations of force are considered, they resolve themselves into mere motion, varying in intensity, it may be, but still the same. I breathe, I listen, I look, I feel. I move; the forces seem various, they are executed differently, but they are all simple motion. So by analogy, if I would set up a fire, I may proceed by different ways; I may take fire from fire—direct propagation; I may strike steel with flint—mechanical excitation; I may expose phosphorus in fine layer to the air—oxidation; I may set an electric machine to work and fire spirit, or drive a voltaic current through conducting substance, and produce a light on combination—electric chemistry; the acts are apparently different, the forces different, but they are all one and bring continuance of one phenomenon—motion.

It is out of character, therefore, to say that there are various forces in the body; but we may properly say that motion in the body is developed by modifications of process. At the same time these modifications are limited; for, excepting the mechanical vibration of the air on the ear, the mechanical entrance of light by the eye, and the mechanical influence of touch on the exposed surfaces, the motion of the body in all that pertains to its own power of action is through heat. It may be, that the motion which in all the soft parts of the body is manifested in the form of heat, is in the nervous centres and nervous system as a whole transformed into electric or thermo-electrical motion; but the precise source of the motion is unquestionably thermal, and it is certain that, unless through this process motion be universally diffused through the tissues, motion otherwise applied ceases to exert any local effect. Hence a frozen hand is indifferent to the most violent external excitation or mechanical motion; hence, although an electrical

current will pass readily enough through the nerves of frozen muscles and through frozen muscles, it fails to excite contraction in the absence of a thermal current. Heat is thus the sustaining motion of the organism; it holds all the active parts in such motion, that without undue waste they shall be ready under excitation or communication of new motion to act at once according to their functions. Heat, in other words, sustains the equilibrium of motion in animal bodies; it does not in the same direct manner as in the steam engine do everything, for, if it did, the body would cease to be self-regulating; but it keeps the body up to a given standard of motion and prepared for action. This reading of the value of heat-motion in the organism is of primary importance in the physics of disease.

The body thus prepared for action requires only for work extra motion, or, as the old men called it, "stimulus." It receives this from without and from within; from without in those external impressions wrought by light, sound, touch (all of which are motion); and from within by motion communicated from the nervous centres and cords; motion, which is itself derived from the combustion of the blood, and is therefore thermal in its origin.

Thus every stimulus is motion; motion communicated to parts ready to be set in motion. Just as an engine when prepared to start, by being charged with heat, waits only for the engineer to put on the pressure for its wheels to revolve and its movement to commence, so the body equally and similarly prepared moves, locally or generally, when new motion is communicated.

It was in failing to recognise the action of added motion, stimulus, that the theory of the *vis insita* of Haller fell short of the truth: Haller saw that in every muscle there was a certain standard of motion independent of nerve-stimulus: but he did not see that when by pricking a muscle he caused contraction, he was doing what the nerve normally did, communicating motion; and that, in fact, the movement he saw was nothing more than the propagation, or it might be said, the echo of the movement of his own hand; and not seeing this, he stopped short at the *vis insita*. On the other hand, the vibratory theory of Hartley failed, because it recognised nothing except the stimulus, or the motion from without. We have now more light; in truth, however we may differ as to the specific kind of motion in the healthy body, we hold demonstrative evidence of motion always present through heat, always universally diffused, and always passing from the body so as to be properly equalised. We hold also demonstrative evidence of motion as a stimulus, as derived from without and from within the organism.

OF THE PHYSICAL ORIGIN OF ANIMAL MOTION.

To endeavour to go back to the origin of animal motion would be to attempt the definition of a first cause. We might say that animal motion is derived from the motion of the earth, because, if the earth were to lose its two motions for the most infinitesimal period of time, all motion upon it would cease; or if its motions were quickened, all motion upon it would be proportionately increased. But admit so much, and thence the further argument: the earth derives its motion from the sun. But the sun has motion; and whence is that derived? Whence motion throughout all space? We must stop at the question. Without thinking, then, of the first cause of motion, we come to secondary causes—to those means by which the universal motion is conveyed through special parts, by which it develops itself through matter, or by which it is expended on matter; and in this field we have certain facts which are, I

had nearly said, sufficient for all that we would reasonably know. We find motion coming to us directly, as in light from the sun; we find motion coming to us indirectly, as in heat derived from the sun, but elicited through the earth; and we find motion that proceeds from combination of opposing conditions on a vast scale, as in electrical storms. But more: we have illustrations of secondary causes of motion in smaller details, as in the mechanical friction of bodies, and in chemical combinations. In the animal organism, we trace the origin of the motion by which its mere mechanism is animated, in the chemical union of oxygen with carbon. The union of the air and blood is precisely to the body what the mainspring is to the watch. From the union, motion results, and is universally communicated to the organic parts; nor can there be any inertia or death while that communication continues. In addition to this—the force of evolution—the body receives motion from without, and by that means it takes impressions and assumes reason. The first is essential to any manifestation of life; the second is supplementary to the higher development of life. Without the first, an animal could not be constructed; but without appreciating the second directly, the animal may live: it may neither take in light by the eye, sound by the ear, nor sensation by the touch, and yet it may live.

The perfect organism constituted for motion from its own centre, and influenced by motion from without, remains in health so long as the forces, internal or external, are in due relation to the matter of the organism. Let the internal force be unduly raised or depressed, and the body is diseased; it is overactive, or it is inactive. Withdraw from the body the external forces, and it sinks into a machine; stun it with some overwhelming external force, and its mechanism is deranged or destroyed; it is made ill, or it is killed.

In the physics of disease, all our knowledge must rest on our correct appreciation of animal motion, and mainly of that motion which is derived from the oxygenation of blood. I shall direct attention in the next chapter to this last named point.

OBSCURE CASE OF CANCER OF THE STOMACH.

By WILLIAM DATE, Esq., Ilkeston, Derbyshire.

H. M., aged 55, was an unmarried woman, of small independent means, which she eked out by winding thread for the manufacture of gloves. She came of a healthy family, none of whom had had cancer. She had always enjoyed good health, with the exception of an attack which she had when about thirty-five years of age, and which lasted about a fortnight. During that time she had a feeling of weight at the epigastrium; no pain; persistent vomiting, the vomit occasionally consisting of altered blood. She menstruated with regularity until forty-three years of age. She never suffered from shortness of breath, and, in short, since the attack mentioned, her health had been good. About the beginning of August 1864, she began to have a sensation of weight and fulness at the epigastrium, coming on about half an hour after meals, which never, however, amounted to pain, and generally passed off in about an hour. Since that date, she had been gradually and slowly losing flesh. About October 15th, she began occasionally to vomit her food mixed with acid mucus. She was of rather a penurious disposition, and therefore, although she was much distressed by the vomiting (which for the last few days had been persistent), she did not seek medical assistance until Oct. 21.

I then found her still tolerably fat, but very weak and prostrate; pulse 110, very small and thready. The complexion was sallow, but not cachectic. She could not retain on her stomach the smallest quantity even of fluid nourishment. The matter vomited had an acid taste, was of a dark grumous character, and evidently consisted of mucus and altered blood (which character it had retained for the two previous days). Pressure over epigastrium gave very slight pain. No distinct tumour could be felt, although there seemed to be some fulness. There was no apparent enlargement nor tenderness of the liver. On applying the hand to the epigastric region, the aorta could be felt pulsating very distinctly; but there was no fremitus. Auscultation over heart revealed a soft systolic apex murmur. The first sound could be heard all along the aorta, thoracic and abdominal; along the iliacs, and even as far as the femorals. The bowels had not acted for two days.

October 22. The vomiting continued in spite of remedies. In answer to an enema, she had passed a quantity of dark pasty feces, containing blood. She was free from pain. The urine was not albuminous.

October 26th. She continued in much the same state until to-day. I saw her in the morning, and found that the pulsations of the aorta were distinctly visible at the scrobiculus cordis. In the evening, she had taken a tablespoonful of beef-tea, and was vomiting after it, when she suddenly threw her head back, and ejected about a pint of bright-scarlet blood. I was fetched hurriedly to her, as the attendants thought she was dying. I found her very weak, cold, and pallid; pulse 130; skin cold and clammy. The pulsations of the aorta were become more visible, and were now apparent from the ensiform cartilage to below the umbilicus.

October 27th. She continued very prostrate. The violent pulsations continued, as also the vomiting. She passed by stool this morning a considerable quantity of black blood.

October 28th. Dr. Robertson of Nottingham saw her with me in consultation to-day. On examination, he found things pretty much as above described. There was no enlargement of liver; no distinct tumour; very slight tenderness on pressure over stomach; mitral systolic murmur; pulsation of abdominal aorta to be seen and felt; no fremitus. On listening over the spine opposite the celiac axis, he detected a single rough bruit, heard only during inspiration, and disappearing during expiration. Vomiting continued, but there was now no blood. It consisted chiefly of food swallowed, and of acid mucus.

October 29th. She gradually sank, and died this morning, exhausted.

I omitted to mention a single soft murmur heard all along the abdominal aorta.

Autopsy 48 hours after death. The body was from the first not much emaciated, the belly being covered with fat half an inch thick, and the omentum also being tolerably fatty. All the abdominal organs appeared to be *in situ*. On trying to remove the stomach, it was found firmly adherent to the liver. In breaking down the adhesions, the stomach was opened, and a quantity of dark grumous fluid escaped. The smaller curvature and the upper part of the posterior wall were occupied by an irregular, nodulated scirrhous mass, about two and a half inches in length, one and a half in greatest depth, and about half an inch in thickness. About the centre of it was a small ragged ulcer, not larger than a threepenny bit. The part attached to the liver was inflamed, and felt soft and pulpy. The liver itself was not enlarged, and appeared to be quite healthy in structure. The left ventricle of the heart was slightly hypertrophied and dilated. On the free edge of one of the flaps of the

mitral valve was a little, roundish, soft, shaggy nodule. The substance of the heart was rather soft, so that the finger penetrated it with ease. The aorta appeared to be perfectly healthy, as did also the celiac axis and its branches. There was no atheromatous deposit in any of them, and no aneurism.

REMARKS. This case presents many interesting features. Taking the symptoms as they appeared during life, what diagnosis was to be formed? The *malaise* after food, the loss of flesh, the obstinate vomiting, the hæmatemesis, and the age of the patient, would seem to indicate ulcer or cancer of the stomach. But then, on the other hand, the short duration of the attack, the almost complete absence of tenderness, the violent pulsation of the aorta, the aortic murmur, and the profuse arterial hæmorrhage, seem to speak of aneurism. And this view was supported by the presence of heart-affection; by the absence of any family history of cancer; and by the fact that the patient, although sallow, had not the peculiar cachectic appearance which cancer bestows upon its victims. Moreover, the first attack, twenty years before death, was said to have come on suddenly after lifting a heavy weight; and although, in the presence of perfect health for twenty years, it could hardly be suspected that an aneurism was all the time in existence, yet it might well be supposed that one of the coats of the artery had given way during the exertion, and that the part of the artery thus weakened had at last succumbed to the pressure of the column of blood. Then, again, the presence of scirrhous of the stomach being proved by the autopsy, it becomes interesting to inquire the significance of the former attack, so similar in its train of symptoms. It can hardly be supposed that any cancerous deposit then took place, and remained in abeyance for twenty years. What, then, could it have been? Was it due to a simple ulcer of the stomach, which afterwards healed? Altogether, the case was very interesting and difficult of diagnosis; and it was not until a *post mortem* examination revealed the true cause of the mischief that we could come to a definite conclusion. Before death, our opinion wavered between cancer of the stomach and aneurism of the aorta.

[The following letter, written to me by Dr. Robertson, in reply to my report of the *post mortem* examination, forms an excellent commentary on the case.]

Nottingham, November 5th, 1864.

MY DEAR SIR,—Many thanks for your kind note, and very interesting description of the necropsy of our poor patient.

The physical signs I noticed were these: slight dulness over the right margin of the epigastrium; no swelling nor hardness on the most careful examination; visible pulsation in the epigastrium; no fremitus felt there; a soft blowing single murmur, continuous down the course of the vessel, much rougher in the back, but only heard during inspiration there; normal and symmetrical percussion over the whole chest; soft systolic apex bruit; no abnormal respiratory sound, except slight mucous râle in both posterior bases; the complexion sallow, but not the aspect usual in malignant disease; the pulse 108, soft, jerking. The history, especially as to absence of pain, freedom until a late period from sickness, and other symptoms, etc., were exactly those so well described in your report.

I find (after looking over numerous authorities on these subjects) the following description of—

A. *Malignant disease in the stomach*, by Dr. Erinton. "Its symptoms rarely date from more than twelve or eighteen months prior to the death of the patient." (Here they dated only three months.) "It is asso-

ciated with the cancerous cachexia, often with cancerous disease of other organs." (Here neither of these existed.) "In many cases, it forms a hard but moveable tumour in the epigastrium." (Here was absolutely none.) "Its pain has generally a lancinating character, and a time of appearance that belongs rather to the later stage of gastric digestion than that which succeeds deglutition." (Here was no pain, and vomiting came on immediately after the food.) "Its hæmorrhage is more scanty, viz., than that of gastric ulcer." (Here it was very profuse and arterial.)

b. *Abdominal aneurism*, by Dr. J. H. Bennett. "A swelling more or less defined." (This was not present.) "An expansive impulse on applying the hand." (This was very marked in your case.) "A bellows murmur synchronous with or immediately following the heart's systole." (Also very distinct in your case.) "Generally loudest over the tumour, and propagated down the aorta." "The other symptoms are very various, consisting of dragging, or other pain more or less prolonged, owing to pressure, together with functional disturbance." (Dragging sensation was present, with vomiting, which might have been due to pressure.)

On reviewing the whole case with the light which the *post mortem* examination has thrown upon it, I still feel that the diagnosis between malignant ulceration and abdominal aneurism was a difficult one: and though a case which I mentioned to you as having a short time since occurred to Mr. Daniell of Kegworth and myself, where malignant disease of the stomach produced not only pulsation and murmur, but even epigastric swelling, tended very much to point my suspicions to some stomach ulceration as the disease in this instance, yet the occurrence of former hæmorrhage and apparent recovery, the date and progression of the general symptoms; the absence of hardness, pain, cancerous cachexia, or family history; the presence of concurrent cardiac disease, and the profuse arterial hæmorrhage, all went to negative this supposition, and (with the one exception of absence of tumour, which was equally an absent symptom in the other theory) seemed to favour the idea of aneurism.

"Various cases on record," says Dr. Bennett, "have presented a train of very anomalous symptoms, and at various times been considered as different diseases by medical practitioners." Dr. Gairdner gives a striking illustration in his *Clinical Medicine*, p. 495. The case was one of aneurism of the superior mesenteric, and in relation to it Dr. Gairdner remarks:—"The whole of the phenomena under observation at the time of the first attack of hæmatemesis (these were briefly: sickness and vomiting after food, dull pain with tightness and oppression at the epigastrium, anæmia from loss of blood and tendency to syncope, slight epigastric pulsation unaccompanied by any appreciable tumour) were such as to lead directly to the supposition of a chronic ulcer of the stomach."

According to Stokes, the affections which simulate abdominal aneurisms may be divided into two classes, viz., those in which belly tumours receive a communicated pulsation, and those in which there is simply an increased action of the abdominal aorta.

By the absence of tumour in the case before us, one main diagnostic symptom was denied; the murmur was not jerking, but pretty continuous, and therefore like; but it was systolic, and therefore unlike that of an abdominal aneurism. Both the throbbing and the murmur which existed did not depend probably so much upon the anæmia from loss of blood (as they were noticed before this had occurred to any great extent) as upon the irritation of the stomach disease,

analogous, as was pointed out by Dr. Stokes, and confirmed by Dr. Hope, to that form of carotid throbbing which occurs in cerebritis, or of the radials in whitlow.

The case is also interesting, as it bears somewhat upon the discussion between Dr. Gairdner and Dr. Ormerod on the significance of mitral murmur. The murmur here was exactly correspondent with the apex of the left ventricle. It commenced with the first sound when this was at its maximum of intensity, and shaded down into and almost through the pause. After death, there was found a nodule of lymph on the free edge of one flap of the mitral valve. I make no deduction here, but simply mention the facts as they stand.

Yours truly,

WM. TINDAL ROBERTSON.

William Date, Esq.

IS SIMPLE ACUTE ERYSIPELAS A LOCAL OR A CONSTITUTIONAL DISEASE?

By JOHN HIGGINBOTTOM, F.R.S., Nottingham.

IN March 1853, I read a paper before the Midland Counties Branch of the Provincial Medical and Surgical Association at Nottingham, with the following queries.

1. Is simple acute erysipelas a purely local or a constitutional disease?

2. Is it sometimes a local, and sometimes a constitutional disease?

3. Is it simultaneously, both a local and a constitutional disease?

Not having had any answers to the above queries, I repeated them in this JOURNAL on October 10th, 1864, with another query.

Why is erysipelas classed with the exanthemata?

Not having yet been favoured with an opinion from any of my medical brethren, I proceed to give my own from the following facts.

1. I have attended a number of cases of erysipelas on the face and elsewhere, at an early stage of the disease, where there have been no constitutional symptoms; in these, the disease has been directly arrested and subdued by the application of the nitrate of silver. If the erysipelas had been allowed to proceed without the local application, constitutional disturbance would have been the result.

2. If from exposure to wet or cold, etc., a feverish attack takes place, and in several days erysipelatous inflammation supervenes, on a prompt application of the nitrate of silver, along with the usual remedies for the cold, the patient becomes convalescent in a few days; but if the local application be neglected, the inflammation runs its usual course, the constitutional symptoms become more aggravated, and the illness is much prolonged.

3. If the erysipelas and constitutional symptoms appear simultaneously, a prompt application of the nitrate of silver at an early stage of the complaint, and the use of active constitutional remedies, cut short the disease; the patient is soon convalescent; but if the local application have not been used, the disease runs its usual and often destructive course, setting at defiance the most active constitutional treatment.

For many years past I have considered that simple acute erysipelas is a purely local disease, and ought not to be classed with the exanthemata, or constitutional diseases; and that the constitutional derangement alone arises from the local disturbance. I believe the application of the nitrate of silver in erysipelas fully attests it to be a local and not a constitutional disease, as it can be always arrested and subdued by its application.

Various reasons have deterred surgeons from using the nitrate of silver as an external application in erysipelas. One is, that it has been classed with the exanthemata, or as a constitutional disease; and it has been feared that the application would cause metastasis or a determination of the inflammation to internal organs. I have never entertained such an opinion; nor have I seen a single instance in which the application had produced any untoward effects, during the more than forty years I have used it.

Medical men appear to have paid more attention to the application of the nitrate of silver in erysipelas than in other complaints, although they have been treated of in my work *On the Treatment of Inflammation, Wounds, and Ulcers*.

The use of the nitrate of silver in erysipelas having been uniformly successful in my own hands, I was led to investigate the reason why it was not equally so when used by others; this soon became apparent when I observed how very inefficiently the remedy was used both as to the different degrees of the strength of the solution of the nitrate of silver, and the various methods of its application. Were I to record the erroneous directions in the manuals and authors of the present day, a page or two would not suffice. I will relate two.

Mr. Nunneley, in his monograph *On Erysipelas*, in mentioning my treatment of the disease with the nitrate of silver, recommends "from eight to twelve grains of the nitrate of silver to one ounce of distilled water, or six or eight grains in the same quantity of rectified spirit", instead of the concentrated solution I have always used of one hundred and sixty grains of the nitrate of silver to one ounce of distilled water. The weak solution named by Mr. Nunneley is insufficient to arrest the disease, but quite sufficient to bring the remedy into discredit.

In the other case, a surgeon had severe erysipelas on the face and head, and was attended by several of his medical brethren. I was informed that the nitrate of silver had been applied; when I visited him he had violent delirium, causing him to become unmanageable. I observed that the nitrate of silver had been applied on one side of his face, allowing the inflammation to spread over the remainder of the face and the scalp, producing severe cerebral disturbance. By a proper and early application of the nitrate of silver, all the mischief would have been prevented.

An early obstacle to the general and free use of the nitrate of silver arose from the impression on the minds of surgeons that it is a caustic—a *destructive agent*. From the commencement of its application I found that this was not so, and many surgeons of the present day agree with me that it is a *real preservative agent*. I have never seen the cutis vera destroyed by it; indeed, it will not even raise a blister so effectually as cantharides.

For the successful application of the nitrate of silver, the ordinary brittle stick must be used, either in substance or in the concentrated solution; not "the lunar caustic points perfectly tough," nor any of the new preparations of the nitrate of silver, as the crystals and cake used for photographic purposes. (*Vide BRITISH MEDICAL JOURNAL*, July 11th, 1863.)

I have never used a weaker solution than one scruple of the nitrate of silver to one drachm of distilled water, or eight scruples to the ounce of water.

The nitrate of silver has a specific course in its effects when applied on an inflamed skin; its progressive action continues during the first, the second, and the third days, and declines on the fourth, at which period the action of the nitrate of silver and the inflammation of the skin cease simultaneously.

In every case of external inflammation, I apply the nitrate of silver on the whole of the inflamed surface,

and beyond it on the healthy skin to the extent of one or two inches, according to the severity of the inflammation. If the inflammation should progress beyond the boundary, it is usually weaker, and is easily subdued by a repetition of the application. I have not known an instance in which I had not full control over the inflammation in acute simple erysipelas.

From mature and long experience of the nature of erysipelas, I would apply the nitrate of silver on the first appearance of the inflammation, and not run the risk of an hour's delay. If the application was not even necessary, the only inconvenience would be a blackened skin for a few days, of no consequence compared with the injury which might be caused by the spreading of the inflammation. The well known quotation is very applicable—*principiis obsta*.

Reviews and Notices.

MEDICAL ERRORS. FALLACIES CONNECTED WITH THE APPLICATION OF INDUCTIVE METHOD OF REASONING TO THE SCIENCE OF MEDICINE. By A. W. BARCLAY, M.D. Cantab. & Edin. London: 1864.

DR. BARCLAY'S words ought to set the profession thinking. From the days of Hippocrates to our own, wise physicians have never ceased to warn us of the "fallacies of experience" in matters medical; but the golden words of the sages have left us still hugging blindly and fervently as ever those fatal errors of experience. Dr. Barclay now comes and demonstrates mathematically the nature of these errors; and, if he is right in his calculations, there is no longer any excuse for our clinging to them. If we are ever to arrive at anything like truth in our dealings with disease, we must commence a totally different method in getting at facts from that hitherto pursued by us. The British Medical Association a few years ago tried to collect a body of facts concerning the treatment of diseases, upon which to found definite conclusions. The attempt, says Dr. Barclay, was of necessity vain. What can one hundred, two hundred, or even two thousand detailed cases of pneumonia, tell us positively as to the use of a remedy in that disease? Thirty thousand or forty thousand cases, at least, are required to give us any fair idea of the connexion between the remedy and the consequence in such a case!

"If there be 10 such circumstances which may each be present or absent, the number of cases which will not be exactly alike is over 1,000; if there be 15 such, the number will be over 32,000, and each additional circumstance will double the previous number. It seems to me that this gives an explanation of what must have been ever present to the minds of most of us in the whole course of our practice, that no two cases of disease are exactly alike. In the short enumeration of variable circumstances I have given, with reference to all forms of disease, the number greatly exceeds 15; and consequently the number of cases observed before we may expect to meet two similar instances must be quite beyond the bounds of any one man's experience, however extensive."

All this Dr. Barclay proves by algebraic formulæ; and, if his conclusion be right, we need say no more to show the very unsatisfactory basis upon which is founded very much of our knowledge of the effects of

remedies. The profession is deficient in logical precision in its mode of reasoning: this is Dr. Barclay's main accusation; and we think it would not be easy to deny its truth. We jump at the most unwarrantable conclusions, and then believe in the fallacies with the usual pertinacity of credulity. "No argument is more fallacious," he says, or more opposed to sound inductive reasoning, than that "which asserts the curative power of a remedy because in ten, twenty, or even one hundred cases, recovery followed its administration; and yet this is what is commonly meant when experience is appealed to. . . . Three or four rapid recoveries after the employment of a certain drug are, I might almost say, universally cited by the correspondents of medical journals as distinct evidence of its beneficial agency."

This kind of medical logic, so generally practised by our profession, is abundantly illustrated by examples. We jump at conclusions, in our eagerness to cure diseases; snatch at straws, in a fashion which is truly deplorable. Every year, even of this enlightened era of medicine, brings forth its crop of highly vaunted remedies, infallible cures of incurable diseases, or of old remedies applied in some new fashion "with the most admirable effects". But the year passes away, and the disease is still incurable! The fallacious hopes and the high-sounding promises were nothing better than the offspring of "want of precision in the mode of reasoning" of the medical mind which recommended them. Where stands quinine now as an infallible cure of continued fever? Where is *saracenia* to be placed as a cure for small-pox? And where the thousand other asserted remedies, offspring of the illogical doctor's mind?

Such and many more are the serious questions thrown out for our consideration by Dr. Barclay. But what is the remedy for the error? The constant failures of our illogical conclusions seem to teach us no useful lesson. He sees no hope for better things, unless doctors will be content to reason of facts according to the laws of reason—unless they will treat and argue of medical facts as people argue and treat of other ordinary facts which are matters of statistical inquiry. Whether people accept or not Dr. Barclay's formulæ, this we may assuredly say, that his conclusions drawn from them are exactly coincident with the painful results of our experience. Broken hopes and grievous disappointments in the effects of remedies have long been suffered by practitioners of medicine; and who can reasonably doubt that the punishment has been the natural and just consequence of our own illogical arguing? If we build our practice on a sand-bank, we must not express surprise if the superstructure comes to grief. Whether Dr. Barclay improves or not our logical processes, still the profession is greatly indebted to him. He has done for us what no one has, we believe, done before; viz., *demonstrated* the fallacies of our method of judging of the effects of remedies. If Dr. Barclay hold his ground, we now possess a means by which we may at once knock over and show the emptiness of the many crude therapeutical promises which disfigure medical literature, and lead so many of us astray; and we may add, by so frequently deceiving, make so many amongst us altogether sceptical.

Seriously, therefore, do we recommend a perusal of this little volume to our medical brethren. We

cannot do more than give a bare outline of its contents. In our few lines it is impossible to find a way clearly through his account of inductive and deductive reasoning, and so not easy to tell men how they are to remedy false reasoning. In a few words, however, we may describe Dr. Barclay's point. It is this. There are two ways of arriving at conclusions: 1. Proving that something is the effect of a cause—induction: and 2. Showing that there must be some relation between them, although we cannot make it out, because of the number of times this something happens—the numerical method. For the elimination of the errors attaching to this second method, Dr. Barclay refers us to Dr. Guy's process for a correction (p. 43); and at p. 110 gives an example of the process. As regards the errors attending the first method, Dr. Barclay holds that no cause can be considered as proved until the law of causation is enunciated, as is detailed at p. 57 *et seq.* No law, for example, has ever been expressed touching blood-letting, and the statistics of its effects are not sufficiently comprehensive; and hence we know next to nothing about its value (pp. 80-81). No collections of cases, however successful they show, are of any value unless they either establish a law or are in sufficient numbers to form statistics. One instance, like Newton's apple, may suggest the law. Fifty or a hundred instances prove nothing, if they suggest no law. The grand point, therefore, always is, where possible, to frame a law. It is a law that Epsom salts purge; a law that cinchona bark cures ague: that vaccination counteracts small-pox. These facts are proved, and susceptible of proof. But it is not a law that calomel and opium are good for peritonitis, or bleeding for inflammation. No doubt, these things are susceptible of proof, or of disproof, if they were worked out: but then the fact is, that no one has yet worked them out. Thousands of prescriptions, resting on no foundation at all (p. 115 *et seq.*), are written with the idea that the remedy prescribed will cure the disease! Systematic writers give us full details of diagnosis, treatment, and pathology of diseases, and point out what they think the best treatment: but this is not enough. Let them say, if they like, that calomel cures pneumonia; but then let them *prove* it also. Plenty of authors have asserted that calomel *causes* absorption of lymph; but where is he who has ever *proved* the fact? Calomel may have that effect, but the proof is yet to be given. Let us be well assured there is no short cut to knowledge for doctors, more than for other people. Things must be proved in our department of science, just as they are proved in other branches. Until we have proved the connexion between cause and effect, or until, as Dr. Barclay puts it, we have established a law of causation, we have done nothing for our science. In the meantime, our only substitute is, in such cases, a *skilled experience*. There are a great many facts which we do know and can usefully apply; but where knowledge fails, then perforce we must act upon belief. Only, in thus acting, let us avoid the fatal error of presuming we *know* where we only believe or assume.

Such, we believe, is a correct outline of the views of Dr. Barclay, as set forth in his *Lumleian Lectures*, now published. We sincerely trust they may attract the serious attention which, in our opinion, they so well deserve. Dr. Barclay logically enough concludes that, unless we lay the foundations of me-

dicine scientifically, we can never hope to see medicine raised to the position of a science.

CURVATURES OF THE SPINE: THEIR CAUSES, SYMPTOMS, PATHOLOGY, AND TREATMENT. By B. E. BRODHURST, F.R.C.S., etc. Second Edition. Pp. 93. London: 1864.

THIS second edition of his work Mr. BRODHURST has re-written and enlarged, and illustrated with new woodcuts. We may at once say of it that, in the matter of type, paper, and illustrations, this volume is the very luxury of printing. There is no necessity for us to recommend the work to our readers; for it has already done that for itself in the first edition. One main point, upon which Mr. Brodhurst lays especial stress, may be noticed. He shows that there are many causes of spinal curvature, and that the curvatures differ just as do the causes of them. This point, he says, is "neglected and misunderstood." The importance of a clear diagnosis springs from the fact, that the treatment must first be directed to remove the primary curve. Again, he says, in regard to the treatment of advanced spinal curvature, the curve can only be gradually unfolded, it cannot be broken down by pressure, as used to be attempted under the old system of treatment. The book is well and clearly written; and the whole story of spinal curvatures is told in it in a few plain sentences by one who is clearly master of the subject on which he writes.

PHOTOGRAPHS (COLOURED FROM LIFE) OF THE DISEASES OF THE SKIN. By A. B. SQUIRE, M.B.Lond. Nos. IV and V. London: 1864.

Two more fasciculi of Mr. SQUIRE's useful photographs are before us. The fourth part represents Scabies, typical of animal parasites; and the fifth, Chloasma, intended as an illustration of vegetable parasitic diseases.

EASY POISONING. Professor Taylor says: "There is no legal restriction on the sale of any poison excepting arsenic; but the statute for regulating the sale of this poison is a dead letter. Nux vomica in powder is also easily procurable, under the usual pretext, that it is intended for the destruction of vermin. Strychnia, morphia, veratria, prussic acid, the oil of bitter almonds, and preparations of colchicum, are not commonly found in the shops of the lower class of druggists or village shopkeepers; but if the applicant is prepared to pay for them, he will find no great difficulty in procuring them. There are unnecessary facilities given for the purchase of a variety of noxious drugs, such as oil of savin, cantharides, tincture of ergot of rye, and tincture of the perchloride of iron, which are employed for the purposes of criminal abortion. Corrosive sublimate, the sulphates of copper, iron, and zinc, and other mineral irritants, are easily procured, and are employed to procure abortion. There are two poisons of a most potent kind which can be readily purchased even by boys and girls, either at the village shop or at the druggists. These are *strychnia*, sold under the name of Butler's vermin killer or Battle's vermin killer, and *cyanide of potassium*. The first has been the means of death in many cases of murder and suicide. The *cyanide of potassium* is another deadly poison, which is fatal to life in small doses, and from its great solubility in liquids it admits of being easily administered in a poisonous dose. It is largely used in photography."

British Medical Journal.

SATURDAY, JANUARY 7TH, 1865.

THE PAST AND THE PRESENT.

WE may perhaps be allowed, without show of presumption, to take this opportunity, in entering upon a new year, of saying one or two words concerning the British Medical Association and its JOURNAL.

The profession has been told so much of late both as to the decadence of the Association and the miserable incapacity of its organ, that it is well we should know what are really the existing signs or proofs of these our suggested misfortunes. Our ruin has been so often positively asserted, and so plainly demonstrated, by some of our friends(?), that we really are almost surprised to see ourselves still an existing fact; and still more astonished, on taking stock of our position, to learn that, so far from approaching a collapse, we are really in a most flourishing condition. Indeed, the contemplation (by comparison) of what we were a few years ago and what we are now, has been to us such a quiet source of satisfaction, that we cannot do less than ask our fellow-associates to participate with us in the enjoyment of the same. And they need not fear; we are not going to weary them with details of our wonderful deeds done in the past; or with strong promises of what heroics will be done in the future; but just simply to detail a few dry facts, which, to men of business, are better than much windy buncombe. Let us just see, in plain terms, what our present position is, and how we have fared during the time—the last four years—that the JOURNAL has been under its present management.

On entering upon office in January 1861, the new year's gift which awaited us was the notices of retirement of some 150 members of the Association—rather a cool reception, it must be acknowledged—these notices, moreover, not being always couched in the most complimentary of terms. So that, in fact, we commenced operations with less than 1800 members, and with, it appeared, not the best of reputations. We dare say, indeed, that there are not a few of our readers who will bear witness to the fact that our prospects at that period were not of the brightest.

Now, we well know that doctors, of all people in the world, should be careful about confusing the *post hoc* with the *propter hoc*; we will, therefore, leave to others the question of connexion between antecedent and sequence, and, having said what our Association was in January 1861, confine ourselves simply to telling what we now are in January 1865. There are people who believe that man was the pro-

duction of a "fortuitous concourse of atoms"; and, of course, there are people who will see no relation between the management of its JOURNAL and the prosperity of the Association; and they have a perfect right so to draw deductions. But, then, we are sure they will not quarrel with us for stating the fact—viz., what we were and what we are; provided we leave out the middle term, and do not presume to speculate—viz., why we are what we are.

Well, then, from 1861 to 1865, our Association has been constantly in a steadily progressive condition both in members and reputation. Its members have increased from nearly 1,800 to above 2,400 in that period. Many gentlemen who resigned in 1860 have again joined the Association. Never since its birth has it held more influential meetings than its three last—those which were held at London, at Bristol, and at Cambridge. Let any one run their eye through the list of celebrities who met together on those occasions, and they will have proof enough and to spare of the fact.

The "irresistible logic of a few facts", therefore, shows that we are in a healthy condition;* and we will not weaken them by any details. If any other proof were necessary of this successful condition, we should find it in the very remarkable and persevering and incessant attempts which have been made by some of our *soi-disant* friends upon us. Never have these critics of our Association been so constant, so reckless, and so untruthful in their attacks, increasing *pari passu* with our success, upon the Association and its JOURNAL, as they have been during the last few years. Our readers have, no doubt, by this time taken the measure, and know the full meaning and purport, of those attacks—of that sort of *per fas et nefas* "pegging away" which President Lincoln admires. It is assuredly no business of ours to defend the JOURNAL's existence. It would be insulting the Association so to do. The Association has chosen to have a JOURNAL; and the Association can choose, if it please, not to have a JOURNAL. The crafty trickery of those who attempt to decry the JOURNAL, while lauding the Association, is transparent enough. But the JOURNAL is manifestly a part of the Association; for the Association made it, and elects to have it. To insult the JOURNAL is, therefore, to insult the Association, whose JOURNAL it is.

We may, therefore, warmly congratulate the Association on its present position of strength, and its steady progress in the estimation of the profession; on the influence exercised by it on the profession, and on its satisfactory financial position. We need not recount the work done by the Association, for it is recorded in our pages; but, if we were inclined to vanity, we might find occasion for it in the fact, of

which we have been more than once assured by a gentleman engaged in collecting annual records of medical science; viz., that he finds more scientific medical matter available for his purposes in the BRITISH MEDICAL JOURNAL than in any other of the weekly medical periodicals.

THE MEDICAL PROVIDENT FUND.

WE have much pleasure in announcing, at the request of the Chairman and Secretary of this Fund, that a code of Rules has been drawn up by the Executive Committee appointed at the meeting of Directors held on October 20th, 1864; and that the Rules have been printed and forwarded to each Director for consideration, prior to a meeting of the Board to be held in the course of the present month. It may, therefore, be fairly expected that subscribers to the Fund will be invited to give in their names in a few weeks hence.

The Executive Committee has made liberal provision for the admission of all registered practitioners in the kingdom, and proposes, we understand, what will no doubt be a satisfactory solution of the question of limitation of age. The tables of annual premiums have been placed in the hands of Mr. Finlaison, the actuary to the National Debt, who has most kindly promised to give his aid to the Directors.

We would again beg the assistance of our associates in increasing the Guarantee Fund. This Fund, as shewn by the list published in this day's JOURNAL, already amounts to nearly £600; and its increase will give proportionate stability and power to the Provident Fund. The term "Guarantee Fund", we must observe, does not quite accurately express its objects. It is, in fact, an *auxiliary Fund*, to be made up of donations and of money received from any other sources than the annual contributions of members; and will be applied to meet preliminary expenses, so far as may be necessary to supplement the ordinary fund in case of pressure; and to form, if possible, a nucleus for the more extensive development at some future time of the objects of the provident scheme. We are sure that many who have not yet made contributions to the Guarantee Fund will gladly do so. They should forward their names, stating the amount which they are desirous of contributing, either to the Chairman, Dr. B. W. Richardson, 12, Hinde Street, Manchester Square, W.; or to the Secretary, Dr. Henry, 15, George Street, Portman Square, W.

THE FRENCH PROVIDENT FUND.

THE title itself of the French Medical Association, and the mode of expenditure of its money, show clearly enough that it is, as we have already said, mainly a provident fund. Its title is, "Association

* The formation of a new Branch at Newcastle is suggestive at the present moment.

Générale de Prévoyance et de Secours Mutuels des Médecins de France"—a mutual provident society, as the report of this year states, in fact. "The Association has this year consecrated a sum of 18,900 francs to succouring its unfortunate brethren, in aiding its needy members, their wives and children." Further on in the report, we read words addressed to French perverters of facts, which we recommend to all other perverters of the same. "Those who have misunderstand the objects of our institution could not have read our title—Association for providing mutual help. Providence, above everything, is our duty and our title. Our Association is the good father of the family, who, at the price of a momentary sacrifice made by his children, accumulates for them a capital which they will enjoy hereafter." Then, again, said M. Rayer, President, at one of the annual meetings: "Assistance, the *essential object of our undertaking*, has been given in all cases where it has been asked for." And what say the very statutes of the Association? "The first object which it has to attain is to succour those of its members whom age, infirmity, disease, etc., have brought to misery;" "to help their widows and orphans."

The Association, again, does not (as has been asserted of it) interfere in the prosecution of quackery. It allows its members to do so, if they please; but, to use the words of M. Rayer, "the laws of the Association do not allow its direct intervention as prosecutor; but members of our Association have had the courage to undertake these prosecutions. The war against quackery is not declared in our laws, but is one of our natural attributes." We may add that, as far as we can make out, the Association has never spent a single *sou* in aid of these prosecutions. They have all been undertaken by private individuals (doubtless, under the sanction of the branch societies), at their own risk and peril.

Our readers will, therefore, now clearly see how thoroughly justified we have been and are in calling the French Medical Association a provident fund. "Assistance", as M. Rayer, the President, said, "is the essential object of our work." And the illustration of the truth of his words is found in the fact of the gift of 18,903 francs this year to unfortunate medical men, their widows and children. Not a farthing has been spent by it, as far as we can make out, for any other object, excepting the general expenses of the Association. The one of our cotemporaries who has given so different an account of the Association's doings, for the sake of exciting unjust, untrue, and invidious comparison with our own and altogether differently constituted Association, is, we will charitably suppose, not sufficiently gifted with a knowledge of the French tongue to fully comprehend its meaning. To supply this failing, we will translate for his benefit the following words out of the last annual report of the Associ-

ation. After telling of the mode of distribution of its gifts of 18,903 francs, the report says:

"The stream of charity, though small, is increasing, and will soon become a large and deep stream, equal to the succouring of all our misfortunes. *This is the pious and fraternal object of our institution.*"

Neither has the Association spent a *sou* in raising statues to the shades of our great medical departed, as has also been stated. It simply has appointed two Committees to raise subscriptions for the purpose of erecting a statue to Laennec.

THE LATE ARCHIBALD ROBERTSON, M.D., F.R.S.L.&E.

DR. ARCHIBALD ROBERTSON, whose death we lately announced, was born in Scotland, in the parish of Cockburnspath, near Dunse, on the 3rd of December, 1789. He received the first rudiments of education at the Dunse school, and afterwards attended the school of a Mr. Strachan in Berwickshire. He then proceeded to Edinburgh, where he attended various courses. In 1808, he passed the examination for assistant-surgeon in the navy. He was then first of all appointed to the Millbay Prison Hospital at Plymouth, a *depôt* for French prisoners. Here he nearly lost his life while bathing under "The Hoe"; and was rescued, in fact, from a watery grave, by a French prisoner, who had contracted for him a great regard. In 1809, he was appointed to the *Caledonia*, 120, Lord Gambier's flag-ship in the Basque Roads. This was at the moment when the late Lord Dundonald tried to burn the French fleet. In this ship, he served for some time in the Baltic; and afterwards was removed to the *Persian*, in the West Indies; and, finally, in the *Cydnus* frigate, he saw a good deal of boat-service in the attempt on New Orleans during the American war. When the peace with America was declared, he went on half-pay, and received a medal with two clasps. He then went to Edinburgh, and there made his first acquaintance with Sir James Clark and the late Sir John Forbes, forming with those gentlemen a warm friendship, which was only interrupted by death. They had all three passed some years in the navy, and were now met together in Edinburgh to take their medical degree. Dr. Robertson took his degree in August 1817. The subject of his thesis was, "The Dysentery of Hot Climates," bearing the following motto from Thucydides on the *Plague*: "*αὐτὸς τε νοσήσας, καὶ αὐτὸς ἰδὼν ἄλλους πάσχοντας.*"

After taking his degree, he settled as a physician in the town of Northampton, in 1818, having been guided in his choice of a residence by the advice of the Hon. Captain Spencer (the late Lord Spencer), under whom he had served in the navy. At first he met with little encouragement, not having, as he said himself, received a single fee during the first

year of his residence in Northampton. He seriously contemplated, in fact, moving his penates elsewhere; but at last determined to try his luck for another year. The first two months of the second year did not yield him a solitary guinea; and yet, before the end of this second year, Fortune smiled well upon him, for he was in receipt of upwards of £800. Every subsequent year produced an increased income. In 1820, he was elected physician to the Northampton Infirmary; and then his success was secured. He continued constantly engaged in a busy and most arduous practice—arduous from the length of journeys which he was forced to take in discharge of his professional duties—up to the year 1853.

The continued labours which he had gone through in practice at length told upon his naturally vigorous constitution; and he, therefore, wisely resolved to retire, having realised a very handsome independence. He left Northampton; and afterwards, up to the time of his death, led a retired life in the west of England. In 1859, a testimonial and address, set on foot by the South Midland Branch, were presented to him by above one hundred members of the medical profession in Northampton and its neighbourhood. The address, and Dr. Robertson's reply thereto, were published in the *BRITISH MEDICAL JOURNAL* for June 25, 1859.

Dr. Robertson was a Fellow of the Edinburgh College of Physicians, and had also received the honour of the fellowship of the Royal Societies of both London and Edinburgh. In 1844, he acted as President of the British Medical Association, in whose prosperity he always took a very warm interest. His name appears among the list of those present at the inaugural meeting of the South Midland Branch in 1856. The last meeting of the Association which he attended was at Torquay. As an instance of his kind and delicate feelings, we may state that, when the Association met at Bristol in 1863, he was so unwell as to be quite incapable of attending the meetings; yet he did not like to be near and not appear. He therefore, in order that his absence might not be attributed to indifference, preferred going away from Clifton altogether for the time.

Before he obtained active practice, Dr. Robertson occupied much of his time in contributing to some of the journals and reviews of the day. No exact record of the papers he wrote remains; but he contributed, we are informed, to the *British Review*, articles on Modern Scepticism, Peter's *Letters to his Kinsfolk*, Mrs. Brunton's *Emmeline*, the Contagion of the Plague, and the Quarantine Laws. It is also supposed he communicated a paper to the *Edinburgh Review* on Fever, in 1818 or 1819. He also contributed one or two articles to Forbes's *Cyclopædia of Medicine*. The writing period of his life, however, was quickly past: the active business of professional duties soon wholly occupying his attention.

Occasionally he gave an address or lecture in the town: and of these remain records of those on Civilisation; the Wisdom of God; the Living Principle in Plants, Animals, and Man.

Six or eight months before his death, he showed symptoms of dropsy from disease of the heart and kidneys. The dropsy steadily increased, and ultimately carried him off.

Dr. Robertson was naturally of a most modest and retiring disposition; and before he left Northampton, unfortunately, destroyed all his diaries and all the papers which would have afforded full details of his career. He never liked being in any way paraded before the public. The facts here given have been kindly supplied to us by his son, the Rev. George Robertson, by Sir James Clark, and by his friend and medical adviser, Dr. Marshall of Clifton.

During the long period in which Dr. Robertson was in practice, he held the leading position as a physician in the county of Northampton. His services were frequently sought for also in the neighbouring counties. We need hardly add, that he was well known to the profession throughout the country. But it was not only as a physician that he held a leading position. As a member of society, he was highly esteemed. He lived on terms of friendship and intimacy with all classes around him. He was exceedingly liberal, and ever evinced a very warm interest in advancing the social position of his fellow-townsmen. His purse was liberally open to the calls of charity. He took also a very warm interest in politics, and was a strenuous defender of Church and State. The following remarks, made in the *Northampton Herald*, truly represent the feelings towards him of his fellow-townsmen.

"The deceased gentleman has not so long survived his active life, but that there are very many persons left who remember with pleasure the urbane, considerate, kind-hearted, and skilful physician. During a long life in Northampton, he earned for himself a professional reputation which it falls to the lot of few provincial physicians to enjoy; whilst his well-stored and well-trained mind made his society eagerly sought, and valued. In religious and political principle he was a 'Church and Queen' man to the backbone. There was no mistake about Dr. Robertson. His convictions were deep-rooted and well-founded, and he never shrank from doing aught that 'became a man' in support of the principles which he cherished. For many years our Infirmary received the benefit of his eminent abilities; and, on his retirement from the post of physician in ordinary, the Governors marked their appreciation of his past services by conferring upon him the title of physician extraordinary to the institution. In his private, as in his public life, it was his privilege to set an example worthy of imitation; but it was reserved for those who enjoyed his intimacy to know how admirably he discharged the various relations of husband, father, friend, and benefactor. Should the picture we have drawn seem somewhat highly coloured, we can only say that it falls short of the reality."

A CASE, *Rumball v. Bates*, of some interest to the profession, has been lately decided by the County Court judge at St. Albans. A youth, 19 years of age, named Garratt, was placed under the charge of Mr. Rumball on account of his being the subject of attacks of delirium tremens of a very aggravated character. There was no evidence to show that he was of unsound mind, irrespective of the attacks of delirium tremens. Mr. Rumball's charges were afterwards disputed; and he, therefore, brought this action. He charged £10 for one month's board, £10 for removing Mr. Garratt without notice, and £5:16 for other items—in all £25:16; and payment was refused on the ground that he had unlawfully taken charge of a lunatic contrary to the Lunacy Act—*i.e.*, without the order and medical certificate required in such case. The learned Judge (Mr. Whigham) gave a very clear exposition of the state of the law; and, after reviewing the meaning of the terms "lunatic" and "of unsound mind", decided that Garratt was not of unsound mind within the meaning of the law, and, therefore, gave a verdict in favour of Mr. Rumball for payment of his charge. In giving judgment, Mr. Whigham said:

"It would be easy to instance many cases of 'persons of unsound mind' in common speaking, who cannot be supposed to be within the scope of the statutes. Women during pregnancy are not unfrequently subject to delusions that would cause them to be accounted 'insane' for the time; yet it has never been supposed necessary to have lying-in hospitals registered as houses for the reception of insane persons. In some of the commonest fevers, a patient is often delirious and of unsound mind for a greater or less length of time; yet no one has ever supposed that such places as (for instance) the sanatorium at Eton or Rugby should be licensed; or that the medical men and nurses there having the care and charge of a patient should require an order and medical certificate for reception, notwithstanding the patient, at the time of his being taken in, may unquestionably be 'of unsound mind.' After the most careful consideration that I have been able to give to the matter (and I speak with diffidence as to the medical bearings of the subject), a case of simple delirium tremens is not a case within the scope and object of the legislation in question. A man, being a lunatic, may, by intemperance, become the subject of attacks of delirium tremens; and the circumstance of his having these attacks would not withdraw his case from the protection of the Lunatics' Treatment Regulation Act; but a man, otherwise of sound mind, who is suffering from delirium tremens, is not, therefore, necessarily a lunatic, though, no doubt, during the paroxysm of the attacks, he may be under the wildest delusions, and, in common phrase, may properly enough be called 'raving mad.'"

THE following is a well told instance of what may be effected upon a strong and vigorous man by bleeding and starvation. The case is reported from La Charité.

A man, 37 years old, plumber, always had excellent health up to February 1861. He was at that date seized with pneumonia, and treated on the "expectant" plan. After nine days' illness, and this

negative treatment, becoming worse, he was sent into hospital. On the day of his admission (the 14th), he was, at 3 P.M., bled to sixteen ounces; at 6 P.M., to sixteen more ounces; and at midnight, was cupped to sixteen ounces. On the 15th, at 9 A.M., he was bled to sixteen ounces; and at midday, to sixteen ounces more. On the 16th, he was bled again to sixteen ounces. His diet was all the time, as we conclude, of the *absolute* kind—that is, at zero. After all this bleeding, he was "infinitely better"; the pain in the side and the oppression having disappeared. On the 17th, however, he had a violent discussion with one of his workmen who came to visit him; and thereupon was seized with convulsions, and remained insensible for an hour. In the evening, oppression of breathing and pain in the side returned as badly as on the first day. On the 18th, therefore, he was bled to sixteen ounces morning and evening; and, on the 19th, to sixteen ounces in the morning, and cupped to sixteen in the evening. In six days, therefore, from the vigorous man were taken ten pints of blood—all the blood in a man's body at one time, according to some physiologists—the patient being kept all the time on "juleps". The man, we are told, never recovered his health. He had paralysis after the convulsions; and three weeks later, on account of retention of urine, was placed under M. Velpeau for three months. He then had three blisters applied, one on his belly and two on his loins. The patient, getting worse in the matter of paralysis, was sent on to M. Briquet. He was now paralysed in all his limbs, and stuttered so as to be incomprehensible, with facial paralysis. Gradually the paralysis of the arms and face disappeared. In Jan. 1862, he came under the charge of M. Beau. A minute account is given of his condition. "He has complete paralysis of sensibility and motion of the lower limbs; the sensibility of the arms is diminished, but motion is good; the man has the look of a woman; frontal pains; pupils small and contracted; hearing acute; smelling power bad; heart's action feeble, point not felt at thorax, slight systolic *bruit*; milky foods alone remain on his stomach."

THE present number of the JOURNAL contains the first of a series of papers by our talented and industrious associate, Dr. B. W. Richardson, on "The Physics of Disease". In these papers, the author will treat of the physical and chemical phenomena of the body, and especially of those connected with the blood; and will, throughout, aim at demonstrating the bearings of physiology on the practice of medicine. The second paper of the series will, in all probability, appear in next week's number.

WE recommend the following to the attention of the Governors of Bethlechem Lunatic Asylum; to those who think lunatics can be better cared for in the midst of a large city than in the country.

"The lunatic asylums of Charenton and Bicêtre being found insufficient, both in size and arrangements, for the wants of the present day, the city of Paris is about to have a very large establishment built on a property they have bought, about fifteen miles from Paris, on the Orleans Railway. According to the plans and estimates, the expense will amount to fifteen millions. There is to be an immense park, chalets, gardens, workshops, etc."

THERE are at the present time nearly 17,000 patients in the hospitals of Philadelphia, nineteen in number. Some of the hospitals contain between 3000 and 4000 patients. They are all under the direction of Surgeon John Campbell—a command “which equals that of any corps in the field.”

Lariboisière, the model hospital of Paris, stands nearly at the head of the list of Paris hospitals as regards the mortality of its inmates. It is, indeed, a remarkable fact, that the mortality during the last ten years in Paris hospitals has been greatest in the three hospitals which are ventilated by artificial means; viz., Beaujon, Lariboisière, and Necker.

M. Pouchet says that he has found in the secretions from the inflamed surfaces of the trachea, bronchus, nasal fossæ and internal ear, bacteria, monades, and vibrones; and he concludes that they are the cause of the itching, pain, and irritation, which accompany them. When the microscopic creatures are no longer visible in the secretion, the irritation ceases.

Ether, as an anæsthetic, appears to be in the ascendant in France. Surgeons there appear to have some great fear of chloroformisation. Many hospital surgeons and many private practitioners have given up the use of chloroform altogether, or use it only to produce partial insensibility. At Lyons, nothing but ether is employed; and so also at Naples. “*Multa renascentur*,” etc.

Le Monde de la Mer, a splendid volume, is a posthumous work of the late Dr. Moquin-Tandon. It is published by his family without his name, in deference to a wish expressed by him shortly before his death.

MR. CEELEY ON VACCINATION.

M. DIDAY's *grand fact*, alluded to in the JOURNAL of December 24th—“the vaccination of animals”—which he states “has been often attempted in France, but universally abandoned, and has been successfully practised under his eyes in a way to insure future success,” to my mind is no *grand fact* at all.

Nothing is easier than the transmission of the vaccine from one cow to another; nay, let but one cow in a dairy exhibit the disease and, as sure as fate, all the rest milked after that cow will take it merely by smearing the lymph on the slightest crack on the teats or udder of its neighbour.

But if there be little or no difficulty in vaccinating or *retro*-vaccinating the cow on the *vulva* with humanised lymph, which I and many others have often done, how much more easily can the animal be vaccinated on the same part by lymph taken from its own species? So much for M. Diday's “grand fact.”

Then, as to the advantages of obtaining, in every instance, vaccine lymph direct from the cow. It is alleged that:—

1. It would satisfy those who deem the present current stock weakened by successive transmissions.

2. It would dispel all apprehension of the transmission of human constitutional disease (particularly syphilis).

3. It would prevent various ailments and cutaneous eruptions, so often believed by parents to result from the present mode of vaccination.

Now, as regards the first allegation; that appears to me more of the nature of an assumption than a fact. Yet I believe in the expediency and adopt the practice of re-vaccination at puberty, as a general rule, to secure many in whom vaccination has but a temporary or imperfect influence.

In regard to the second allegation; here no argument is needed as to its influence; but I think its necessity is greatly overrated. And I cannot but think that our continental brethren are very careless vaccinators, and that syphilis must be very much more prevalent among their infantile population than with us.

It is remarkable that so many cases of vaccine syphilitic inoculation are recorded on the continent, while we hear of no such thing here; I cannot persuade myself that such inoculations are unavoidable.

As to the third allegation; there is much nonsense uttered here, as we all know. And those who believe their children will escape cutaneous eruptions when vaccinated direct from the cow, will be greatly mistaken.

Many children have skins—all children more or less—prone to throw out eruptions, papular, vesicular, pustular, or exanthematic, upon the excitement of the least increased vascular action. Hence ordinary vaccination will cause what most other febrile and cutaneous irritations produce. Hence, more irritating lymph, as it is when direct from the cow, will be more effective in the production of the above results.

But there is a special vesicular vaccine eruption attending the acme and decline of the vaccine disease. The Germans have called it “*Nachpoken*.” I have often, nay almost always, seen it as a secondary eruption on the teats and udders of the cows immediately before and after the decline of the disease in them. The same I have repeatedly seen in children, especially in the early removes from the cow; and still continue at times to witness it, to the great temporary disfigurement and annoyance of the patient, and the chagrin and vexation of the parent. It is essentially a genuine vaccine secondary eruption. I have witnessed it in vaccinating the dog.

I have coloured illustrations of this secondary eruption in man and animals, and have seen some severe and a few dangerous cases in children where the skin and visible mucous membranes were copiously occupied with it.

But now as to the practicability of this mode of vaccinating. If adopted in Great Britain, it must not be as a “*luxury*,” but as a *necessity*. If it is good for the rich, it is equally good for the poor. We must not have one mode for the upper, and one for the lower classes. *That will never do*. If attempted, it would justly excite the prejudices of the poor, already too much excited against vaccination. Well, then, the direct method must be *universally* practised.

How establishments of vaccine-producing cows in all parts of the kingdom are to be inaugurated, endowed, and sustained, I must leave for the consideration of those who think them necessary. Perhaps, however, in these days of “limited liability” companies, it would be wrong to despond or despair! There is no great probability of Government interference, I think. But, it may be said, if the Government enforce vaccination, that Government ought to secure the best means for the purpose. Doubtless, their action would not commence till they were assured of an absolute necessity and a satisfactory issue—*quod est demonstrandum*.

Scientific Notes.

ALLEGED FALLACY IN MARSH'S TEST FOR ARSENIC.

Dr. Arthur Gamgee gives the following conclusions from some experiments on this subject. 1. When the acid used in Marsh's process contains a very small quantity of nitric acid, mirrors of metallic arsenic are obtained from extremely minute quantities of arsenic added to the apparatus; in other words, a trace of nitric acid present in the sulphuric acid in Marsh's process does not perceptibly interfere with the formation of mirrors of metallic arsenic. 2. When the acid used in Marsh's process contains a considerable percentage of nitric acid, the formation of mirrors is checked; the extent to which this occurs depending upon—(a) the proportion of nitric acid present in the sulphuric acid, (b) the quantity of arsenic present in the apparatus. 3. Under these circumstances the addition of an organic fluid to the apparatus does not promote the formation of mirrors. 4. When nitric acid prevents the formation of mirrors of metallic arsenic in Marsh's process, it does not check the evolution of arseniuretted hydrogen, but prevents its being decomposed by heat into arsenic and hydrogen, by causing its oxidation; a ring of crystals of arsenious acid being, under these circumstances, formed inside the tube. (*Edin. Med. Journal.*)

HUMAN BONES FOUND AT POMPEII.

M. de Luca adverts to the process successfully adopted at Pompeii, for obtaining casts of the persons who lost their lives at the time of the eruption which caused the destruction of that city. The fugitives were covered by the ashes, which settled on all the minutest folds of their garments and every part of their body. This coating of ashes hardened in course of time, and the flesh wasting away under it left a hollow mould, into which the explorers of the present day, when they are fortunate enough to discover it in time, pour liquid plaster, and thus obtain an exact cast of the body. The number of casts thus taken is four. The bones found at Pompeii contain all the principles to be met with in the bones of the present period. On being heated moderately, they lose about 9 per cent. of their weight. At a red heat, and protected from the air, the bones become black, and lose 16 per cent. more; if calcined in the open air the loss is 20 per cent. The coal obtained in a closed crucible disappears in the shape of carbonic acid. The total quantity of the latter varies between 4 and 9 per cent. In testing the bones with concentrated sulphuric acid for the purpose of ascertaining the quantity of carbonic acid aforesaid, the glass tube in which the operation is performed exhibits signs of corrosion, which is owing to a certain amount of fluoride of calcium contained in all these bones. M. de Luca states that, when found, they are somewhat soft, and after being treated with weak acids their organic matter, cartilage for instance, remains in a gelatinous state, preserving all the time their primitive shapes.

AEROLITE.

M. Lespiault, who had announced to the Academy of Sciences that a violent explosion had been heard on September 24th, wrote again to say that on that day, at 20 minutes past 12 p.m., a fiery globe of the size of a bomb-shell had burst in the vicinity of Mont-de-Marsan (Gironde), with a violent noise resembling the simultaneous report of twenty pieces of ordnance. This noise lasted ten seconds; the direction of the bolts was from north to south.

ERRORS IN OBSERVATION WHICH HAVE A PHYSIOLOGICAL ORIGIN.

M. Faye, in a paper read before the Academy of Sciences, showed that two senses in operation together never act simultaneously. The eye acting alone will measure the most minute distances; the ear can distinctly appreciate the hundredth of a second; and the touch will recognise vibrations at the rate of five hundred to a second. But no two astronomers watching the passage of a star and counting the beats of a pendulum will agree as to the precise moment of time at which the star passes the meridian. Means, however, have been found to obviate these errors, inseparable from human observations and increased by indigestions, fatigue, and numerous other causes, so far as the sun is concerned, by photography and the electric telegraph.

IODOFORM.

Dr. Righini having examined and tried the physiological and therapeutic qualities of iodide of formyle, has found it to possess anæsthetic, antiseptic, and antimiasmatic qualities. When iodoform is administered slowly and continuously it causes excess of secretion from the liver, the lungs, the salivary glands, and the loins; the patient, instead of falling off, as in the case when he is treated with iodine, grows rather fat. Iodoform may be administered without any danger in large doses, which may be gradually raised to three grammes per day; but very large doses will cause symptoms of iodism.

THE CHARACTERS OF GOOD DRINKING WATER.

Dr. Parkes says, the general characters of good drinking water are these. It must be transparent, colourless, without odour, and tasteless; it should be well aerated (as it then appears to be more easily absorbed), cool, and pleasant to drink; it must have no deposit; vegetables should be readily cooked in it; the total dissolved constituents must be within a certain amount. It is difficult, without more evidence than we at present possess, to define this amount, and the following numbers must be taken with some hesitation.

Organic matters should not exceed.....	1.5 grains per gallon
Carbonate of lime	16 "
Sulphate of lime	3 "
Carbonate and sulphate of magnesia	3 "
Chloride of sodium	10 "
Carbonate of soda	20 "
Sulphate of soda	6 "
Iron.....	0.5 "

The proper amount of gases is stated by Boudet to be as follows.

Nitrogen	6 cubic inches per gallon
Oxygen.....	2.5 " "
Free carbonic acid 5.5 to 7	" "

At the Sanitary Congress held at Brussels in 1853, it was decided that the total amount of solids ought not to exceed 0.5 grammes per litre (=35 grains per gallon), and the same rule had been previously laid down in the *Annuaire des Eaux de la France pour 1851*; but this statement is of little use, as the salts differ so much in their effects on the system; the carbonate of lime may exist without injury in large quantities; the carbonate of soda in still greater; but sulphate of lime or magnesia is prejudicial in much smaller amounts. It must also be conceded that in some cases water still more highly charged with salts, especially the alkaline salts, has been used for many years without apparent injury. (*Manual of Hygiene.*)

DIALYSIS OF PLANT-JUICES.

Dr. Attfield has dialysed a few plant-juices. The tops of the common potato yielded a crop of nitrate of potash, some cubes of chloride of potassium, hexagonal crystals not analysed, sugar, and an ammonia salt. The deadly nightshade gave nitrate of potash, an unknown magnesia salt in square prisms, sugar, etc. Pea-pods yielded only sugar. The common garden lettuce contained nitrate of potash, tetrahydra of undetermined composition, sugar, and ammonia. Cucumbers furnished sugar, ammonia and sulphate of lime. The cabbage also furnished sulphate of lime and ammonia. Stramonium contained so much nitrate of potash, that dried portions quite deflagrated on being ignited. Dr. Attfield thinks his proposed application of dialysis promised to be of great service, directly and indirectly, in investigating vegetable physiology. (*Chemical News*.)

WATERING PLANTS WITH IRON.

It is stated as a new discovery that wonderful effects may be obtained by watering fruit-trees and vegetables with a solution of sulphate of iron. Under this system beans will grow to nearly double the size, and will acquire a much more savoury taste. The pear seems to be particularly well adapted for this treatment. Old nails thrown into water and left to rust there will impart to it all the necessary qualities for forcing vegetation as described.

RESPIRATION OF PLANTS.

The researches of M. A. Cahours have led him to the following conclusions. 1. All flowers left in a limited atmosphere of normal air consume oxygen and produce carbonic acid in proportions varying as the flower is scentless or not. 2. The circumstances under which the phenomenon takes place being identical, the proportion of carbonic acid increases as the temperature is raised. 3. Generally, with flowers from the same plant and of equal weight, the quantity of carbonic acid produced is rather greater when the apparatus in which the experiment is performed is exposed to the light than when it is in darkness; but the proportion is, nevertheless, sometimes the same under either condition. 4. When the normal air is replaced by pure oxygen the differences become much more marked. 5. Buds produce rather more carbonic acid than fully developed flowers, which is explicable by the greater vitality of the buds. 6. Flowers left in inert gas disengage small quantities of carbonic acid. 7. Finally, the pistil and stamens, which possess the greatest vitality of any part of the flower, consume the greatest quantity of oxygen and produce the largest proportion of carbonic acid. (*Comptes Rendus*.)

PRODUCTION OF A VACUUM.

A. Dr. Girouard, of Chartres, says that a vacuum can be produced by means of a current of air. If, for example, a strong current of air be blown across the mouth of a vessel with a small aperture, a vacuum is produced in the interior of the vessel.

PHOSPHORESCENCE.

M. Carus has shown that the phosphorescence of the *Lampyris Italica* is, when removed from the insect, unctuous, and much like melted phosphorus; if put on a watch-glass it loses its phosphorescent quality in drying, but regains it if put under water. This experiment cannot be successfully repeated more than once or twice; still the fact of this revival of phosphorescence is important, inasmuch as this is the first instance of a substance emitting light when put under water, and losing this faculty again when it gets dry.

ORGANIC SYNTHESIS.

M. Berthelot's new work, comprising his lectures on Organic Synthesis, delivered at the College of France during the present year, is making sensation. He gives the *coup de grace* to the method of making alcohol from coal-gas, by showing that the process is extremely costly, and that the resulting alcohol is exceedingly impure. M. Berthelot ventures to hope that fibrine, albumen, casein, etc., will ultimately be found in the laboratory; an expression that has caused great alarm in the minds of certain persons, who seem to think that M. Berthelot thereby assumes for science the power of creating living beings.

THE ORIGIN OF WINE-FERMENTS.

M. Bechamp shows: 1, that the presence of air is not necessary either for the development of the ferment or for the commencement of the vinous fermentation, and that the grape brings everything necessary for the perfect accomplishment of all the phenomena; 2, that the surface of the grape may carry the sporules and globules of the ferment; 3, that the stalks and leaves of the vine may carry the same organisms on their spores, which may, in fact, be met with on various parts of other vegetables. The author found, by experiment, that he could set up fermentation in a solution of sugar, by introducing grape stalks and vine leaves, and also by the petals of the red poppy. A microscopic examination of the waxy matter on a ripe grape, he says, reveals the presence of organised bodies identical with those produced in fermentation.

RESEMBLANCE OF OFFSPRING.

At a late meeting of the Academy of Sciences, M. Chassaing laid it down as a rule that a first born daughter always strongly resembles her father. Newly married men should make a note of this law.

CHLOROFORM A TEST FOR SUGAR IN URINE.

M. Caillien states that when urine containing sugar is violently shaken with half its bulk of chloroform the mixture becomes milky, and will separate into two layers. The upper is clear and almost colourless, while the lower is white, thick, and gelatinous. When the upper layer is removed, and left to evaporate in a porcelain dish, the liquid becomes syrupy as it evaporates, and after some days the sides of the dish become covered with the wart-like masses of sugar. (*Journal de Chimie Med.*)

PRESERVATION OF MEAT.

Dr. Morgan of Dublin has proposed a new plan for salting animals whole. Immediately after slaughtering, a communication is established between the principal arteries and a reservoir of salt brine placed at a high-level, the effect of which ensures the diffusion of salt through the meat by a process of injection. The published statements affirm that for the cost of sixpence-halfpenny, and in the course of ten minutes, a whole ox can be preserved. M. Runge has published the following method. In an earthen pot, provided with a good lid, pour an ounce of concentrated acetic acid; place over it, so that it may not touch, a grate of osier or wood, and on this lay the meat to be preserved, and then cover with the lid. The acid, evaporating slowly, envelopes the meat, and at the end of twelve days or a fortnight it is both tender and sweet, with an excellent flavour. Dr. Marcet recommends that whenever it is necessary to remove the excess of salt from meat, cured either on the principle of dialysis or in the ordinary manner, the joint should be securely wrapped in a bladder before being introduced into water, and thus a considerable proportion of the nutritive matters be retained.

Association Intelligence.

WEST SOMERSET BRANCH.

A QUARTERLY meeting of this Branch will be held at Clarke's Castle Hotel, Taunton, on Wednesday, January 11th, 1865, at 7 p.m.

Notice of papers or cases to be communicated should be sent to the Honorary Secretary previous to the meeting.

W. M. KELLY, M.D.,

Honorary Secretary.

Taunton, December 10th, 1864.

BIRMINGHAM AND MIDLAND COUNTIES BRANCH.

THE next Meeting of the Birmingham and Midland Counties Branch will be held at the Medical Department, Old Library, Union Street, Birmingham, on Thursday next, at Six o'clock.

MEDICAL PROVIDENT FUND.

THE following contributions have been made towards the Guarantee Fund.

London and Middlesex:	£.	s.	d.
W. Adams, Esq.	5	5	0

Correspondence.

CASE OF PRYCE v. BOWEN.

LETTER FROM EDWARD LUND, Esq.

SIR,—I must ask you to allow me to reply to a remark in your leading article, in last Saturday's JOURNAL, on the unfortunate case of Pryce v. Bowen, in which you say, "Mr. Lund is without excuse."

If it is to be considered as an acknowledged rule in our profession, that under no circumstances whatever are we to express an opinion on the professional treatment of patients by other parties, then I am indeed "without excuse," and must plead guilty, to the fullest extent, of improper conduct in giving any evidence in this case.

I can assure you, I deeply regret the consequences which have arisen from my having given an opinion in respect of the particular treatment of the case during the first nine days after the accident, as set forth in the plaintiff's declaration, which was read over to me, and upon which my opinion was founded. But as to the other charge brought against me, that I sided with a "bone setter" in giving my evidence, I wish distinctly to state that I knew nothing whatever of Evan Thomas, the person referred to, nor was I aware, until I saw him in the witness-box, that he would be in any way brought forward in this trial.

I trust that, although so strong a feeling is expressed against me at the present time, the profession will at least withhold their final judgment on the case, until I have laid before them, as I hope to do through the medium of your JOURNAL, the written opinion I gave in the first instance, and a report of the exact words used by me in my evidence; which, when compared with the questions which suggested them, will, I hope, show that I am not fairly chargeable with the gross misconduct which has been attributed to me. I am, etc.,

EDWARD LUND.

Manchester, January 3rd, 1865.

[Far be it from us to advocate the idea, that under no circumstances ought a medical man to give evidence in a law-court on the professional treatment of

patients by another medical man. What we condemn is the dragging of a medical man into court when there are no sufficient grounds, or no grounds whatever, for doing so. We know our brethren in Liverpool enough to believe, that if Mr. Bowen or any other medical man had injured his patient by gross ignorance or negligence, there would never have been wanting high-minded men among them to enter the witness-box and say so; that it never would have been necessary for the plaintiff to send to Manchester for a medical witness. We believe from Mr. Lund's note, that he has acted under an error of judgment. EDITOR.]

MEDICAL CHARGES.

LETTER FROM J. A. BOLTON, M.D.

SIR,—I send you *Particulars, as Required*, for review. I think the names associated in these two cases are sufficient to warrant me in appealing to the profession and its Council for a tariff of legal, or, to use a pleasanter term, legitimate charges. We never go to law, as a body, without strong compulsion or strong temptation. When we yield to either force, it is only becoming in us to give our brothers the full benefit of our experience.

With this object in view, I have put the cases of *Jackson v. Gee* and *Crossley v. Morley* into pamphlet form, for the benefit of the profession at large. To indemnify myself against unnecessary loss, I have priced the compilation at threepence, and have ordered 500 copies for distribution in the profession. The profession may judge from it whether we need a tariff sanctioned by the Medical Council, or whether we are to remain *in statu quo*, and pocket public abuse instead of pay for our professional services.

Against the practice of giving advice gratis, either in hospital or private practice, you have wisely cautioned the profession for years past; nay, more, you have rebuked and chastised, and marked the spot where charity begins, and where it ought to end, in what we do for the public weal. My plaintive appeal in this instance is, to invoke your aid in helping us through the county court, when *taken or driven* there; that we may in future avoid and avert the necessity of calling a brother to say black is white, or that brown is a genteel mixture of the two, the exact mixing of which "no fellow on earth can understand," though gifted with the genius of a Serjeant Miller as judge. I am, etc., JOHN A. BOLTON.

Campbell House, Leicester, January 3rd, 1865.

ENUCLEATION OF EYES. Whenever the eye is the seat of chronic inflammation and its sight is lost, it should be enucleated, says Dr. Mecker.

IS FEVER CONTAGIOUS? The Secretary of the London Fever Hospital writes as follows on this subject. "Contagion is stayed; or, to speak more correctly, is transferred from the habitations of the poor to the wards of the hospital, where the officers, nurses, and servants not unfrequently become its victims. I find that during the present year two assistant medical officers were attacked, one of whom died. Seventeen of the nurses had typhus, three of whom died. The engineer also had typhus, and died; and at the present moment the excellent matron of the hospital is in a hazardous condition under typhus. Referring to the last three months of 1863, I observe that within that short period the resident medical officer and two assistant medical officers, together with four nurses, had typhus. One of the nurses died. The proportion of casualties among those whose humane vocation it is to grapple with disease here exceeds that of the battle-field."

Medical News.

APOTHECARIES' HALL. On December 29th, 1864, the following Licentiates were admitted:—

Chabot, Frederick, Camberwell Road
Goss, Tregenna Biddulph, Newington Place, Kennington Park
Harris, Henry George Benvenuto, Finchley
Hawkins, Henry Mortimer, St. Mary's Road, Peckham

At the same Court, the following passed the first examination:—

Loane, John, London Hospital

APPOINTMENTS.

VALPY, W. H., Esq., to be Colonial Surgeon for Her Majesty's Settlements in the Falkland Islands.

ARMY.

ABBOTT, Assistant-Surgeon F. T., 41st Foot, to be Staff-Surgeon.

ABBOTT, Staff-Surgeon F. T., to be Surgeon 24th Foot, *vice* J. L. Holloway.

ARMSTRONG, Staff-Surgeon L., M.D., to be Surgeon 13th Hussars, *vice* H. M. Webb, M.D.

HOLLOWAY, Surgeon J. L., 24th Foot, to be Staff-Surgeon, *vice* J. D. C. Reade.

KELLY, Staff-Assistent-Surgeon J., to be Assistant-Surgeon Royal Artillery, *vice* J. A. Scott.

MACBETH, Assistant-Surgeon H. M., 91st Foot, to be Staff-Assistent-Surgeon, *vice* J. A. Scott.

MACBETH, Surgeon-Major J., M.D., 74th Foot, to be Surgeon 16th Lancers, *vice* W. K. Park.

MAKER, Staff-Assistent-Surgeon V., to be Assistant-Surgeon 41st Foot, *vice* F. T. Abbott.

MUNRO, Surgeon W., M.D. 93rd Foot, to be Surgeon-Major, having completed twenty years' full-pay service.

SCOTT, Staff-Assistent-Surgeon J. A., to be Assistant-Surgeon 91st Foot, *vice* H. M. Macbeth.

WEBB, Surgeon H. M., M.B., 13th Hussars, to be Staff-Surgeon, *vice* L. Armstrong, M.D.

WHITE, Staff-Surgeon C. J., to be Surgeon 64th Foot, *vice* J. Macbeth, M.D.

ROYAL NAVY.

BANKS, George F., Esq., Surgeon (additional), to the *Mæander*.

COWAN, Michael W., M.D., Surgeon, to the *Zebra*.

CRAIG, Thomas, Esq., Surgeon, to the *Rattlesnake*.

RYAN, George H., Esq., Surgeon, to the *Shannon*.

INDIAN ARMY. To be Surgeons-Major, Bengal

Army:—

ANDERSON, Surgeon J., M.D. (now Deputy Inspector-General).

BROWN, Surgeon J., C.B. (now Deputy Inspector-General).

BRUCE, Surgeon H. A., M.D. (now Inspector-General).

BRYDON, Surgeon W., C.B. (retired).

BUCKLE, Surgeon H. B.

CAMPBELL, Surgeon J., M.D., C.B.

CAPE, Surgeon H.

CHRISTIE, Surgeon R. (retired).

EATWELL, Surgeon W. C. B. (retired).

FRANCIS, Surgeon C. R., M.B.

GIBBON, Surgeon A. (retired).

LAY, Surgeon P. G. (retired).

LECKIE, Surgeon T., M.D. (retired).

McCLELLAND, Surgeon J. (officiating Principal Inspector-General).

MARTIN, Surgeon W. (retired).

MORRISON, Surgeon A. C. (retired).

MORRISON, Surgeon J. S., M.D.

OAKLEY, Surgeon R. H.

PITT, Surgeon W. (retired).

RAE, Surgeon G. (retired).

RANSFORD, Senior Surgeon J. (retired).

ROSS, Surgeon W. H. B. (retired).

SAUNDERS, Surgeon G.

SIMPSON, Surgeon A., M.D., M.A.

STAIG, Surgeon J. A. (retired).

STREYER, Surgeon T. R. (retired).

THORNTON, Surgeon H. J. (retired).

THRING, Surgeon E. B.

WALLICH, Surgeon G. C., M.D. (retired).

WARNEFORD, Surgeon C., M.D.

WHITE, Surgeon A., M.D. (retired).

Wood, Surgeon J. (retired).

To be Surgeons-Major, Madras Army:—

BLACKWELL, Surgeon J. H.

CLEGHORN, Surg. H. F., C., M.D.

DUFF, Surgeon C. M., M.D.

FITZPATRICK, Surg. J. (retired).

FORRESTER, Surgeon W.

GOODALL, Surgeon A. (retired).

HARPER, Surgeon H. T. W.

HIBBENS, Surgeon W. (retired).

HEUDE, Surgeon W. W., M.D.

KANE, Surgeon M., M.D.

KELLIE, Surgeon J. (retired).

LOVELL, Surgeon J. (retired).

MACLEOD, Surgeon A. C., M.D.

NOTT, Surgeon H.

To be Surgeons, Bengal Army:—

BAILLIE, Assistant-Surgeon G. O., M.D.
 BUTT, Assistant-Surgeon W. B.
 CLARKE, Assistant-Surgeon J. J.
 DALE, Assistant-Surgeon A. J., M.B.
 DALY, Assistant-Surgeon G. H., M.D.
 DALZEL, Assistant-Surgeon W. F. B., M.D.

To be Surgeons, Madras Army:—

GILES, Assistant-Surgeon J. G.
 MARRETT, Assistant-Surgeon H. R. D.
 MILLER, Assistant-Surgeon J., M.D.
 OSWALD, Assistant-Surgeon H. R., M.D.
 PAUL, Assistant-Surgeon J. L., M.D., A.M.

VOLUNTEERS. (A.V.=Artillery Volunteers; R.V.= Rifle Volunteers):—

HEAD, R. T., Esq., to be Hon. Assistant-Surgeon 5th Sussex R.V.
 HESSELEHAYE, J., Esq., to be Honorary Assistant-Surgeon 34th Yorkshire R.V.

DEATHS.

BOWLER, J., Esq., Surgeon Royal Navy, lately.
 EARLE. On December 23rd, 1864, at Ripon, Frances, wife of Francis Earle, M.D.
 FAIRBAIRN, W. C., Esq., Assistant-Surgeon Royal Navy, lately.
 FLYNN, Thomas F., Esq., Staff-Assistant-Surgeon, lately.
 GRANT, George A., Esq., Assistant-Surgeon Royal Artillery, lately.
 JONES, D., Esq., Surgeon Royal Navy, lately.
 KELLY, A. H., Esq., Assistant-Surgeon Royal Navy, lately.
 *MOORE, Edward Dennis, Esq., fourth son of the late Brigadier-General George Moore, Colonel 59th Regiment, Bengal Army, at Walsall, aged 31, on December 21, 1864.
 *NEILL, Hugh, L.R.C.P.Ed., at Liverpool, aged 58, on December 21st, 1864.
 O'LOUGHLIN, James, M.D., at Bayswater, aged 69, on Dec. 19, 1864.
 PARK, Wm. Ker, Esq., Surgeon 16th Lancers, lately.
 POTTS, T. W. B., M.D., at Matlock Bridge, Derbyshire, aged 41, on December 23rd, 1864.
 RATTY, W., Esq., Surgeon Royal Navy, lately.
 REICARDS, J. B., Esq., Surgeon Royal Navy, lately.
 SIMPSON, William, M.B., Surgeon 71st Foot, lately.
 WOOD, C. B., Esq., Surgeon Royal Navy, lately.
 YOUNG, E., M.D., at Croydon, on January 2.

DR. GEORGE KEMP is a candidate for the Coronership of Leominster.

UNIVERSITY OF EDINBURGH. The Duke of Argyle has been elected President of the Associated Societies of the University of Edinburgh. There were four candidates, the Duke of Argyle, Lord Ardmillan, Professor Christison, and Sir Archibald Alison.

DEATH OF A NAVAL SURGEON FROM ACCIDENT. The *Jamaica Guardian* says: "We learn from a private source that a lamentable occurrence took place on board Her Majesty's ship *Steady*, between Bermuda and Halifax. The surgeon, who was unwell, took a sleeping draught, which, from the disordered action of the heart or the too large quantity taken, proved fatal; for, on a brother officer going to call him the next day, the unfortunate man was found dead."

A NEW MINERAL. Professor Church, of the Royal Agricultural College, Cirencester, has recently been describing a new mineral from Australia. It is a sort of combustible shale, which occurs near the River Mersey, north side of Tasmania, and from it Professor Church has extracted a substance which he calls tasmanite. It seems to resist the action of all but sulphuric and nitric acids; alcohol, ether, and other powerful solvents have no action upon it, even on the application of heat, and its composition chiefly consists of carbon, hydrogen, and sulphur. When tasmanite is heated in the air, it burns readily with a very smoky flame and offensive odour, recalling that of some specimens of Canadian petroleum.

THE STATUE OF LAENNEC. The sum of 965 francs has been up to this time subscribed to the fund opened by the French Medical Association for raising a statue to Laennec.

DEATH THROUGH CHLOROFORM. At Leeds, on December 28th, an inquest was held upon the body of Mr. Blaxland, a tea-dealer. The deceased, who was in a weak state of health, had for some time taken chloroform for the purpose of easing pain and obtaining sleep. A medical man warned him several times against the danger of doing so, and on December 25th he was found dead, with a bottle by his side partly filled with chloroform. A verdict was returned in accordance with the evidence.

FATAL EXPLOSION. Mr. Crowther, "dealer in oxygen and hydrogen," Manchester, and his son, have been killed by the explosion of an iron retort, in which the father was making oxygen from a mixture of binoxide of manganese and chlorate of potash, or what he had bought as such. At an inquest held on his body, however, a verdict of manslaughter was returned against Mr. E. G. Hughes, a druggist, who had sold the mixture the deceased was operating with, which mixture was analysed by Dr. Roscoe, and found to be composed of manganese, chlorate of potash, and something that was either soot, lamp-black, or charcoal. Such a mixture, Dr. Roscoe said, would be as explosive as gunpowder.

THE CHARGE AGAINST MR. BOWEN. At a meeting of medical practitioners at Birkenhead on the 27th ult., *apropos* of the case *Pryce v. Bowen*, the following resolutions were unanimously passed. "That this meeting desires to express its deep sympathy with Dr. Bowen on the vexatious trial to which he has been subjected in the case of *Pryce v. Bowen*, and begs to offer its sincere congratulations on the very satisfactory manner in which his professional skill has been vindicated by its result." "That this meeting strongly deprecates the conduct of medical men appearing in court as experts to give evidence against their professional brethren." "That a subscription list be opened to assist in defraying the legal expenses incurred by Dr. Bowen in the late trial." "That Dr. Scholfield be requested to act as treasurer, and Mr. Godden as honorary secretary, to communicate with the profession at large with a view to obtain subscriptions."

PATHOLOGICAL SOCIETY OF LONDON. The annual meeting of this Society was held on January 3rd, 1865. In the report for the session 1863-64, the Council stated that the number of members was in advance of what it was last year—more new members having joined during the past session than in any other of which a record has been preserved. The receipts for the year, however, were somewhat less than in the previous year; but this was because in 1862-63 several members availed themselves of the privilege of compounding for all future payments by a life-subscription, while in 1863-64 none did so. This, however, was no permanent disadvantage; since if it diminished the present receipts, it increased the future annual income. This annual income was now more wanted than ever. The large rent lately imposed by the Royal Medical and Chirurgical Society for the use of their rooms taxed the resources of this Society to the utmost. Still it had been thought undesirable to move from a situation which is so convenient and so well known to the members; and, as a saving had been effected on the cost of the present volume, as compared with the last, the income of the Society had been still adequate to meet its expenditure, and even to leave a slightly increased balance in the treasurer's hands. This saving in the

cost of the *Transactions* was the result partly of a reduction voluntarily made by the printer (in consequence of change of prices in that trade), but mainly of a diminished expenditure on engravings. The interest felt in the Society's meetings appeared to be steadily on the increase. Not only were the new members of the Society assuming their full share of the work, but the latest volumes of the *Transactions*, and the latest meetings of the Society, had been enriched by the matured experience of many of the older members. The increasing number of the members of the Society rendered some increase necessary in the number of copies of the *Transactions*. The number now published left only a very small margin for purchase by future members and the public. Several of the volumes were already out of print, and several more must be so in a very short time. A general index to the whole series of the fifteen volumes of the *Transactions* had been prepared, and was in course of distribution to the members. The total receipts of the Society, including a balance from last year of £78:2:6½, amounted to £430:3:4½. Of this sum £27:14:1 resulted from the sale of the *Transactions*—a very large increase on last year; £85:9 was interest on the Society's funded property; and the remainder, £316:10:0, was received by the collector. The total expenses were £343:2:3½; leaving a balance of £87:1:1 to carry forward. These expenses included a sum of £45:3:0 for the purchase of stock, £49:7:11 three per cent. Consols. The money represented the life subscriptions and composition fees which it had always been customary to invest. This made the funded property of the Society £308:11:4. The Council could not allow the retirement of their medical secretary, Dr. Bristowe, to occur without publicly recording their high sense of the valuable services which he has rendered to the Society in that capacity; and hoped that, although they had lost his services as secretary, they might long have the benefit of his co-operation in other offices.

ALLEGED MURDER. Mr. R. Smith, of Winchcomb, Gloucestershire, was last week charged with the murder of his wife by shooting her through the head. Mr. Smith was formerly in practice as a surgeon, but had retired for some years, and lived with his wife alone, without a regular servant, in Winchcomb. He was very eccentric in his manner, but his eccentricities were not considered by his friends great enough to warrant them in placing him under restraint. On Tuesday week a shot was heard in his house. Next morning the prisoner went to his brother, and told his sons that their mother had been shot. Most of the witnesses bore testimony to the fact that the prisoner was of unsound mind. The policeman who apprehended him said he considered he had been in an unsound state of mind for the last five years. At times he had been in such an excited state as to call for his interference. A jurymen stated that he had seen him with a fishing-rod fishing in the turnpike road. Mr. Newman (surgeon) said that ever since he had known the prisoner, twenty years, he had considered him in an unsound state of mind. The jury found a verdict of "Wilful Murder" against Richard Smith, and wished to append to their verdict an opinion of his insanity, but the coroner said that must be left to another court. The prisoner was accordingly committed for trial at the next Gloucestershire Spring assizes.

DISCOVERY OF A MAMMOTH. At a late meeting of the Manchester Philosophical Society, Mr. William Brockbank read a paper, "On the Discovery of the Bones of the Mammoth (*Elephas primigenius*) in a Fissure of the Carboniferous Limestone at Water-

houses, near Leek." A considerable number of bones were found at Waterhouses some weeks since; but, through ignorance of their real character, they became dispersed without attracting attention, a good many having been used to manure the land by a neighbouring farmer. A few of these bones reached the author, and were at once identified as belonging to the skeleton of an elephant. A further search was determined upon; and the author succeeded in finding a large number of bones. Mr. Wardle and Mr. Green, of the Geological Survey, again visited the place, and found very decided fragments of teeth. A large number of bones were submitted to the Society: amongst which were one humerus nearly complete, and part of the second; parts of the pelvis and scapula; one ulna; several carpal and metacarpal bones; the head of the tibia; several fragments of tusks and two fine fragments of teeth, showing very clearly the peculiar narrow transverse plates and ridges of the dentine and enamel by which the teeth of this elephant are distinguished. The fissure in which these bones were found occurs in the upper beds of the carboniferous limestone, and has been exposed by the workings of a quarry. The face of the limestone in the quarry is nearly east and west; and the fissure follows the dip and direction of the strata, being nearly vertical. It is about six feet in width, and is filled up with angular blocks of limestone, cemented together at the sides of the fissure into a solid breccia, the stones being coated with stalagmite, whilst the centre is filled in with angular rubble and damp ochreous clay. The bones were recovered in good condition from the breccia on the drier side of the fissure; but those occurring amongst the damp clay and rubble were so friable that it was quite impossible to save them. Large numbers of ivory flakes were found, which proved to be the remains of the teeth; and one large fragment of tooth was obtained which was decomposing into these flakes. At the furthest point reached, were discovered a humerus in the socket of the scapula, with the head of another humerus resting upon it at the other end, and two cervical vertebrae were found near the scapula. These were the only bones found in their relative positions. It was conjectured that the mammoth had fallen into the narrow fissure before it was filled in. Mr. Wardle found several fragments of the teeth fifteen or twenty feet below the point where the bones occurred. The author had not been able to find any record of the occurrence of the remains of the mammoth in any work on the geology of Derbyshire or Staffordshire.—Mr. Binney said that Mr. Brockbank was mistaken in supposing that no remains of the elephant had hitherto been found in Derbyshire. The late Mr. White Watson, in his *Delineation of the Strata of Derbyshire*, says: "About the year 1663, a large cavern was discovered in sinking for lead ore, upon a hill at Ballege, within two miles of Wirksworth; in which a large skeleton was found, which, in the original account of its discovery, is said to be 'that of a man, that his brain-pan would have held two bushels of corn, and that it was so big they could not get it out of the mine without breaking it.' Several of its teeth were distributed in the neighbourhood, one of which is in the writer's possession. The tooth is ivory; and, when compared with the *dentes molares* of an elephant, no difference can be found." About twenty-five years since, the late Mr. James Meadows presented to the Manchester Geological Society a portion of the tusk of an elephant which he had found in a limestone fissure near Chapel-en-le-Frith. Mr. F. Looney, in his list of organic remains, says: "Part of a molar tooth of the Asiatic elephant was found at Adlington, near Macclesfield."

OPERATION DAYS AT THE HOSPITALS.

MONDAY.....	Metropolitan Free, 2 P.M.—St. Mark's for Fistula and other Diseases of the Rectum, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.
TUESDAY.	Guy's, 1 1/2 P.M.—Westminster, 2 P.M.—Royal London Ophthalmic, 11 A.M.
WEDNESDAY...	St. Mary's, 1 P.M.—Middlesex, 1 P.M.—University College, 2 P.M.—London, 2 P.M.—Royal London Ophthalmic, 11 A.M.—St. Bartholomew's, 1.30 P.M.
THURSDAY.....	St. George's, 1 P.M.—Central London Ophthalmic, 1 P.M.—Great Northern, 2 P.M.—London Surgical Home, 2 P.M.—Royal Orthopaedic, 2 P.M.—Royal London Ophthalmic, 11 A.M.
FRIDAY.....	Westminster Ophthalmic, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.
SATURDAY.....	St. Thomas's, 1 P.M.—St. Bartholomew's, 1.30 P.M.—King's College, 1.30 P.M.—Charing Cross, 2 P.M.—Lock, Clinical Demonstration and Operations, 1 P.M.—Royal Free, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.

MEETINGS OF SOCIETIES DURING THE NEXT WEEK.

MONDAY.	Medical Society of London, 8 P.M. Dr. B. W. Richardson, "On Inhalation in the Treatment of Disease."
TUESDAY.	Royal Medical and Chirurgical Society, 8.30 P.M. Mr. Furneaux Jordan, "On Eczema of the Eyelids, Conjunctiva, and Cornea"; Mr. Desvignes, "On Subcutaneous Injection of Quinine in Ague"; Dr. Dobell, "On Winter Cough."

REGISTRATION OF DISEASE.

MONTHLY RETURN of new cases of disease coming under treatment at Pauper and Public Institutions. (A.) In Manchester and Salford (Sanitary Association). (B.) At Preston (R. C. Brown, Esq.). (C.) At St. Marylebone, London (Dr. Whitmore).

4 weeks ending November 26, 1864.

TO CORRESPONDENTS.

*. All letters and communications for the JOURNAL, to be addressed to the EDITOR, 37, Great Queen St., Lincoln's Inn Fields, W.C.

COMMUNICATIONS.—To prevent a not uncommon misconception, we beg to inform our correspondents that, as a rule, all communications which are not returned to their authors, are retained for publication.

CORRESPONDENTS, who wish notice to be taken of their communications, should authenticate them with their names—of course, not necessarily for publication.

THE GRIFFIN TESTIMONIAL FUND.—SIR: The following subscriptions have been further received on behalf of the above Fund:—Messrs. Davies and Hancom (Gower), 5s.; J. T. Tallent, Esq. (Hingham), 10s.; Dr. R. Anson (Cambridge), 10s. 6d.; W. S. Barker, Esq. (Thingoe), 10s.; A. S. Vandentergh, Esq. (Bethnal Green), £1.1.

Amount previously announced, £108:19:0. Received at the *Lancet* office, £9:14.

I am, etc.,

ROBERT FOWLER, M.D.,
Treasurer and Hon. Sec.

145, Bishopsgate Street Without, January 4th, 1865.

THE FRENCH MEDICAL PROVIDENT ASSOCIATION complains of the malevolence and persistent misrepresentations to which it has been, from its origin, so perseveringly subjected in France. Our Association does not, therefore, stand alone in this respect.

THE SECOND VOLUME OF THE NOUVEAU DICTIONNAIRE DE MÉDECINE ET DE CHIRURGIE of 800 pages and 90 plates, has just appeared. It contains the following articles:—Amenorrhœa, by Bernutz; Amputation, by Guérin; Amyloid Degeneration, by Jaccoud; Anæmia, by Lorain; Anæsthetics, by Giralde; Aneurisms, by Riche; Anginas, by Desnos; Angina Pectoris, by Jaccoud; Anchylosis, by Denucé; Antiaphrodisiacs, by Ricord; Anus, by Gosselin, Giralde, and Langier; and Aorta, by Luton.

PRICE v. BOWEN.—The following subscriptions have been received for Dr. Bowen:—Dr. Scholfield, £5; J. Godden, Esq., £5; G. Walker, Esq., £5; Dr. Ricketts, £3:3; Dr. Downing, £2:2; Dr. Lambert, £2:2; J. Edgar, Esq., £2:2; Dr. Spratly, £1:1; E. L. Jacob, Esq., £1:1; — Daniels, Esq., £2:2; M. Jeunette, Esq., £1; Dr. Craig, £2:2; — Lamb, Esq., 10s. 6d.

A SUGGESTION.—SIR: I was glad to see your remarks upon the professional correspondence from Brosseley. It is not very creditable to us to have this kind of professional dispute circulated in our JOURNAL. Would it not have been better if the two gentlemen had referred their grievances to the Council of the Shropshire Ethical Branch of our Association? Of which Branch, I believe, they are both members. What is an Ethical Society for, if not to settle such points? And why bring them before the public (medical), if they can be decided at home?

I am, etc.,

QUERY.

MR. HOLMES'S SYSTEM OF SURGERY.—SIR: Allow me to call your attention to an error in the following paragraph from the review of *A System of Surgery*, vol. iv, in your last number.

"Mr. Holmes writes on Operations in Childhood; and on Malformations—including attached foetus, congenital sacral tumour; congenital malformation of the face; spina bifida; imperforate rectum; malformations of the umbilicus; hermaphroditism; malformation of skin; and malformation of limbs. Mr. Brodhurst writes on Congenital Dislocations and Fractures in Utero. Mr. Shaw supplies remarks on Congenital Tumours, Congenital and Infantile Syphilis, Infantile Paralysis, Gangrene, Leucorrhœa, Tumours of the Vagina, Rickets, Lateral Distortion of the Spine, and Pigeon-breast Deformity."

Of the subjects here attributed to Mr. Shaw, only the two last—viz., Lateral Distortion of the Spine and Pigeon-breast Deformity—were treated by him; the other sections are written by me. If your reviewer will look again either at the text or the table of contents, I think he will find this plainly stated.

I am, etc.,

T. HOLMES.

22, Queen Street, May Fair, W., January 2nd, 1865.

Clinical Lecture

CONCERNING

LEAD-POISONING AND ITS TREATMENT.

BY

ALEXANDER FLEMING, M.D., F.R.C.P.LOND.,
PHYSICIAN TO THE QUEEN'S HOSPITAL, BIRMINGHAM.

GENTLEMEN,—The cases to which I propose to direct your attention to-day belong to a class that, in this large and busy manufacturing town, is often under our care. We see here, in hospital practice, examples of chronic lead-poisoning of every degree of severity, from the simple colic which may be relieved in a day or two, to the deadly cachexia, with enfeebled brain and paralytic limb, which has carried some of our most skilled workmen to the grave, and has left many hopeless inmates of the workhouse.

Glass-cutting and glass-polishing, the making of red lead, of brass taps, plumbing, the process of enamelling and of soldering iron, are among the occupations which in Birmingham furnish cases of lead-poisoning. There are at present two factories of red lead in this town. In them, lead-poisoning was formerly frequent, and often severe; but of late years, in consequence of improved ventilation of the buildings and greater cleanliness of the workmen, the cases of poisoning are much rarer and milder.

The painters and cutters in glass present the worst examples. This was the occupation of one of my patients in the Queen's Hospital, whose case I will now narrate to you.

J. M., aged 36, by trade a glass-painter, was admitted into the hospital with the following symptoms. The face is pale and sallow; the features are sharp and pinched; the conjunctiva is bloodless; and the countenance wears an anxious expression. The mouth and nostrils are dry, and there is well marked blue edging of the gums. He has a sweetish taste in the mouth; complains of want of appetite, of constipation, and occasional severe colic. The muscles throughout the body are soft and flabby; and he complains of neuralgic pains in the upper limbs, of great general weakness, but especially of loss of power of the right forearm and wrist. The extensor muscles are especially enfeebled, and he has wrist-drop on the right side. The left arm and wrist are also paralysed, but less so than on the right side. The voice is weak and husky. Our patient has a heavy, stupid aspect; is slow of perception; and his memory is much impaired. There is no fever. The pulse is small; and the skin is cool and dry. The urine was tested for lead, but none was found.

History. This man comes from Dudley, where he has been working as a painter of glass for the last three months. Part of the process is as follows. The glass, being brushed over with oil, is then dusted with a fine impalpable powder, composed in part of carbonate of lead, which, suspended in the air, is deposited on the skin, and carried to the stomach and lungs. In two weeks from the commencement of this work, he suffered from constipation and severe colic. These were relieved by appropriate treatment, but have recurred from time to time, becoming gradually more severe up to the period of admission.

In analysing this case, which is an ordinary one, and therefore well suited for an example, let us inquire: 1. How the poison got into the body; 2. Its action there; 3. The channels by which it is eliminated.

We have seen that the powder containing the carbonate of lead is deposited on the skin, and carried to the stomach and lungs. But this powder is comparatively insoluble, and must undergo such chemical changes in contact with the secretions as will render it soluble and capable of absorption. The nature of these changes has not been actually demonstrated; but there is good reason to believe that the lead is acted on by the chloride of sodium of the perspiration and mucus; that a double chloride of sodium and lead is formed, which salt, being soluble, passes through the skin and mucous membrane, and so into the circulation. The solvent action of the chloride of sodium is materially favoured by the presence of free acid in the sweat, mucus, and gastric juice.

Once in the blood, the lead unites with the albumen it finds there, forming albuminate of lead. The blood becomes pale and watery; loses its normal proportion of red corpuscles; and, loaded with the poison, is unable to furnish healthy nourishment to the tissues, in all of which lead is deposited.

Hence the general cachexia and anæmic pallor. The enfeebled nutrition and poisoning of the heart are indicated by the slow and small pulse. The impaired structure of the muscles and nerves is shown first by spasms and neuralgia; and subsequently, as the disorganisation increases, by wasting, paralysis, and insensibility; and, lastly, the deposition of lead in, and perverted nourishment of, the brain, is apparent in the loss of memory, stupidity, blunted sight and hearing, epilepsy, coma, and death.

The lead *colic and constipation* are chiefly, though by no means entirely, local effects of the poison on the alimentary canal. Spasms and neuralgic pains of the intestines are first caused, and these are followed by paralysis and consequent distension of the muscular coat. As the lead exerts a powerful astringent action throughout the system, drying the mouth and nostrils, checking all the secretions, and, among others, that of the intestinal canal, the constipating influence produced by the paralysis of the muscular coat is thus obviously aggravated.

The *blue gum*, caused by the black sulphide of lead, is prominently manifested in the gum-tissue of our patient. It is formed by the sulphuretted hydrogen furnished by the decomposing *débris* around the teeth coming into contact with the metal in the gum. To prove that this chemical reaction takes place *within* the tissue, and not *outside* it in the mouth, we caused the gums to be repeatedly washed with a solution of acetate of lead. This had no effect in increasing the blue coloration. The blue line must be formed very slowly. Washing the lips and inside of the cheeks (as was several times done in this patient) with the sulphide of ammonium does not produce any blackening of the mucous membrane.

The channels by which the lead is eliminated from the system are the intestines, the kidneys, and the skin. The metal has been found in the intestinal secretions, the urine, and the perspiration. Of these three modes of exit, the intestines are the most, and the skin, the least important.

Treatment. Our patient was altogether three

months under treatment, which I will describe in a general manner, to avoid the repetition of daily reports. He was ordered new clothing; the surface was thoroughly and repeatedly cleansed in the sulphuretted bath. All chance of further absorption of lead by the skin was thus removed. During the first week, the following mixture was given.

℞ Magnesie sulphatis ʒij; acidi sulphurici diluti ʒss; sulphuris ʒij; aquæ Oi. Fiat mistura.

A wineglassful of this mixture was given every four hours, or less frequently, so as to cause three or four stools daily. The object of this medication is to convert any lead which may be present in the stomach or bowels into the insoluble sulphate and sulphides of lead, and secure their removal with the stools from the body.

Having in this manner removed all chance of the further introduction into the system of the poison, the treatment was directed to dislodge and expel the lead already in the blood and body.

For six weeks he was given, half an hour before meals, twenty grains of the iodide of potassium, dissolved in four ounces of water, three times daily. In solution, thus diluted, and taken on an empty stomach, the iodide finds ready access to the circulation; meets the lead in the blood and tissues, and forms with it a comparatively soluble double iodide of potassium and lead. In this form, it circulates with the blood, and is finally eliminated by the bowels, kidneys, and skin.

With respect to the use of the iodide of potassium, I wish especially to draw your attention to the importance of giving it in these large doses, and for the period of at least six weeks, if you desire to obtain from its use the full measure of advantage. When it is given in the ordinary manner of five grains three times daily, the kidneys manage to eliminate the drug nearly as quickly as it enters the circulation; and the blood does not become charged with it in sufficient quantity to secure its solvent action on the lead in the tissues. I have had several cases under my care, both in private and in public practice, where the smaller doses had previously been used with little or no improvement, and where the larger doses afforded subsequently the highest measure of success. No fear need be entertained of evil arising from these large doses. I have often used them, and have never observed any injurious result. During the first week or two of the treatment, the neuralgic pains are usually more acute and frequent; but this aggravation of the symptoms, instead of being dreaded, should be hailed as a token of the efficiency of the treatment. They quickly subside.

During the first and second of the six weeks administration of the iodide of potassium, we endeavoured to favour the extrusion of the poison by the bowels; during the third and fourth, by the kidneys; and during the fifth and sixth, by the skin.

During the first and second weeks, we gave half a drachm of the compound powder of jalap, with four grains of gamboge, once or twice in the day, so as to cause daily three or four watery stools. During the third and fourth weeks, diuretics were given. A wineglassful of the following mixture was directed to be taken every two hours; and cold water was enjoined to be drank freely.

℞ Potassæ nitratis gr. 100; spiritûs juniperi ʒi; decocti scoparii ʒx; aquæ ad ʒxx. M. Fiat mistura.

Under this treatment, the urine was much augmented. It was tested for lead, but none was found. In another patient, however, whose urine was examined while he was using the diuretics, lead was detected, although none could be found prior to the commencement of treatment. During the fifth and sixth weeks of the use of the iodide, our patient had a hot sulphuretted bath (containing six ounces of sulphide of potassium to the bath) at bedtime every second night. He remained half an hour in the bath; and, on leaving it, was placed in bed, covered with double his usual bed-clothing, and made to drink abundantly of thin warm gruel. This caused the perspiration to pour very freely from the skin. The sweat was repeatedly tested for lead, but none was found; while the iodide of potassium was always readily recognised.

Of the three channels—the bowels, kidneys, and skin—by which the poison is removed from the blood, I consider the bowels the most, and the skin the least important. Hence, in the eliminative part of the treatment of our patient, purging occupied the first, urination the second, and sweating the third place, in the order of time. Elimination was promoted by *one* channel only at a time—a point too often neglected, but of much moment, if the treatment is to be efficient. It is a therapeutical error to attempt to provoke purging and diuresis at one and the same moment. During the process of elimination, a considerable degree of exhaustion was caused, and was indeed unavoidable; but, in the choice of medicinal agents, I was careful to select those drugs which are at the same time efficient, and depress the least.

Having by these means effected, so far as I could, the removal of the poison from the body, the treatment during the remaining weeks that the patient was in the hospital was essentially tonic, having for its object the making of better and more blood; hence improved nutrition, better structure, and more strength; generous diet, pure air, sun-light, due exercise, cold sponging; and, in the way of medicine, iron, acids, especially the phosphoric, and a little strychnia, as in the following prescription.

℞ Solutionis strychniæ (Fleming) m 50; tincturæ ferri muriatis m 100; acidi phosphorici diluti ad ʒx. M. Fiat mistura.

Sig. One drachm (by measure), in a large wineglassful of water, immediately after dinner and supper.

During the whole course of the treatment, the patient was encouraged to take as much exercise as he could, with the view of promoting the tissue-changes of the body, and replacing unhealthy by healthy structure.

In the treatment of the wrist-drop and palsy, we employed, throughout the whole period of our patient's residence in the hospital, the galvano-magnetic current, the importance of which, when properly used, cannot be too strongly enforced. But, to secure its value, the current must be transmitted by means of moistened conical and pointed excitors from the nerves through the paralysed muscles collectively and repeatedly, so as to arouse, if possible, every fibre, however enfeebled. This should be practised twice daily, with much care and patience, and continued for months, if necessary. This influence may be rendered still more efficient by passing needles

into the nerves and muscles through which the current is passed.

Such, then, is the outline of the treatment adopted. The success was very marked. The patient lost entirely his cachectic aspect; gained a vigorous appetite. The bowels became regular; the muscles larger and stronger; and the movements of the arm and hand were vastly improved, though not completely restored to their normal state.

Our case suggests several interesting questions in respect to lead-poisoning; among which, perhaps, the most important inquiry is: *Why should this man have proved more susceptible to the action of the poison than his fellow workmen (of whom there are many), who had either not suffered at all, or but slightly?* This fact is constantly presented to our notice. For example, of a given number of printers or type-founders, it is observed that perhaps only one or two suffer from lead-symptoms, though all may be equally exposed to their cause. I suspect that in a majority of instances, as I have ascertained to be the fact in our own patient, want of personal cleanliness, and especially the neglect of washing the mouth and hands before taking food, furnishes a sufficient explanation. Another solution of the difficulty has been offered by Mialhe, who supposes that the especial sufferers use salt in undue quantity in their food, by which the fluids and secretions are highly charged with this salt, and are thus rendered more apt to dissolve the poison. However this may be—and the hypothesis yet needs demonstration—my own inquiries justify me in stating that, among those who are poisoned by the contact of the metal with the cutaneous surface, such as lead-glaziers, type-founders, and printers, *those suffer most whose skin is soft and perspirable.*

This fact is well shown in the following case, at the present moment under my care in the Queen's Hospital, and reported by Mr. Melson, my clinical clerk.

C. H., aged 41, a lead-glazier by trade, was admitted as an out-patient on October 21st of this year. His work consists in cutting small panes of glass, and fixing them in lead framework, which he solders together. Thus the lead comes in contact with his hands only, which are covered with black scars and marks made by it. For the last seven years he has suffered constantly from constipation and pains throughout the body, and repeatedly from lead colic. His muscles are soft and weak; there is no wrist-drop, but his hands tremble. His mouth and lips are dry; and there is a distinct blue line on the gum. His aspect is pale, and he has lost flesh considerably. The urine is pale, but no lead was found in it. He states that *his skin is peculiarly soft and perspirable; and that, when at work, his hands were always moist.* This man made a good recovery under the treatment I have already laid down.

Another point merits attention. Our patient had marked wrist-drop; the muscles of the forearm and hand were much more paralysed and wasted than those of any other part of the body. Again, those of the *right* forearm and hand were more affected than those of the left; and, lastly, the *extensor* muscles had suffered, both in weakness and wasting, more than the flexors. Dr. Todd has offered an ingenious explanation of these phenomena, though it does not entirely solve the difficulty. The blood-supply and tissue-changes are most active in those muscles and nerves which are most used, as in the workman's forearm and hand; and, if the blood be charged with

lead, such muscles and nerves will be the more quickly poisoned. This explanation does not apply, however, to the undue wasting of the extensors, as compared with the flexors, and which I believe to be owing to the *local* action of the lead-powder, which naturally falls and rests upon the outer surface of the forearm and back of hand.

It deserves notice, that our patient had not presented any symptoms of gout, a peculiar liability to which has been observed by Drs. Garrod and Begbie as among the less prominent effects of lead-poisoning—an observation which I myself have had several opportunities of confirming, as in the two following cases, which have occurred in my private practice.

Mr. H. —, aged 46, has been for eighteen years a maker of red lead. During the first eight years of this period, he worked himself in the factory, and had lead colic and constipation two or three times. The gums were then slightly coloured; but there never has been any cachexia nor paralysis. During the last ten years, he has only superintended the work, and he has had no lead-symptoms. Four years ago, and again two years ago, he had unequivocal gout in the left foot. There is no hereditary tendency to gout whatever. He has used fermented liquors, but always moderately.

Mr. D. —, his only brother, has also worked in the factory, and had mild symptoms of lead-poisoning. He likewise has suffered from gout in the hands and feet. He takes beer, but in moderation.

In the sixth Report of the medical officer of the Privy Council, it is alleged with truth, that, in consequence of the improved ventilation of workplaces, and by the adoption of habits of personal cleanliness, there has been a great diminution of lead-disease. At the same time, my own observations lead me to the conclusion that wrist-drop and other forms of lead-paralysis are more frequently to be met with in Birmingham than is implied by Dr. Whitley, in the appendix to that Report. Even the most formidable effects of lead on the central organs of the nervous system are still occasionally manifested. I have had several cases of epilepsy from this cause under my care at the Queen's Hospital. One is in the institution at the present moment.

It is that of a man named E. E., aged 50, glass-cutter and polisher, who was admitted on October 5th, 1864, with the following symptoms: Lead-cachexia well marked; aspect vacant and stupid; the mind obviously much impaired; eyes staring. He suffered much from general feebleness of the muscular system; the muscles throughout the body being soft and wasted. Marked wrist-drop, with wasting of forearms and hands. Has no power of extension of wrist-joint, and scarcely any power of separating the fingers. This man has been employed in glass-cutting and polishing for twenty-eight years. He was originally very strong, but has suffered for several years from lead colic and constipation. A year ago, he had in one day about sixteen severe fits, evidently epileptic; and again a like series about a month ago. Since the first attack, he has complained almost constantly of pain in the head. This man has improved somewhat under treatment.*

Most of the sources of lead-poisoning are now well understood; and their effects may be mitigated, if

* The notes of this case are taken from the report of Mr. Melson, clinical-clerk.

not altogether avoided, by the usual precautionary measures. But cases still from time to time occur, where the cause acts secretly and insidiously, and may undermine the health, and even destroy life, without a suspicion existing of its nature. Such causes, when discovered, ought to be made known as widely as possible.

A very interesting example of unsuspected lead-poisoning in a child six months old has been lately mentioned to me by my friend Dr. Jordan, of this place. This infant (T. O.), which was being brought up by hand, without any ostensible cause began to decline, and to present unequivocal symptoms of lead-poisoning; viz., severe colicky pains, constipation, gradually increasing emaciation, and unusual pallor; sickness, dilated pupil; finally, extreme drowsiness, and almost complete paralysis of the upper extremities. The lower limbs were also enfeebled, but in a less degree. There was no convulsion. After two months' suffering, and of mystery as to the origin of the evil, the feeding-bottle was accidentally examined, when the ball-valve and its case were found to be undergoing corrosion; and, as these were made of an alloy containing lead, the cause of the illness was at once apparent. This was removed, and the child made a rapid recovery. It is interesting to note, that in this infant, *which had no teeth*, there was no blue line on the gum.

HOSPITAL PRACTICE:

METROPOLITAN AND PROVINCIAL.

ROYAL PORTSMOUTH, PORTSEA, AND
GOSPORT HOSPITAL.TRANSVERSE FRACTURE OF THE PATELLA; UNION
BY BONE.

Under the care of H. B. NORMAN, Esq.

J. Y., aged 37, was admitted on March 1st, 1864, with a transverse fracture of the patella. The patient, who was in a miller's employment, was carrying a sack of flour. His foot slipped, and he came with great force to the ground in a kneeling position. The patella was split transversely as near as could be in the centre; and the fragments were four inches apart. He was placed in bed in a sitting posture, with a bed-rest supporting his back; and the leg and thigh were placed on an inclined surface, rising gradually all the way from the tuber ischii to the heel. By these means, the extensor muscles of the leg were completely relaxed, and the fragments came easily into apposition. An evaporating lotion was applied; and at the end of a fortnight, all swelling and inflammation having subsided, a starched bandage was put round the thigh from above downwards, so as to counteract the action of the extensor muscles. A similar bandage was applied to the leg, commencing at the root of the toes, making a figure-of-8 at the knee, so as to keep the fragments in perfect apposition. A strong straight splint was then placed behind the knee-joint, and a starched bandage over all. On April 8th, the above appliances were removed, and there was every appearance of osseous union. A strong leather knee-cap was then placed round the knee-joint; and the man was made an out-patient.

He was able to act as carter, and drive his master's horses; and, at the end of six months, resumed his usual employment of carrying flour. He has now perfect use of the limb, and the bone is firmly knit together.

We may consider that the osseous union brought about in this case was entirely owing to the position in which the limb was placed immediately after the accident; but it is only in a hospital where the patient is closely watched by the house-surgeon to prevent him from changing his position from the sitting one, that such a satisfactory result can be hoped for. In private practice, where the patient is more under his own control, we cannot expect such a happy termination.

IMPASSABLE IRRITABLE STRICTURE.

Under the care of E. K. PARSON, Esq.

J. A., aged 23, was admitted an in-patient on January 10th, 1864, with a stricture extending two inches from the orifice within the urethra, a second at the bulb, and a third at the neck of the bladder. The whole canal was in a highly irritable condition, bleeding at the slightest touch. The urine came away in drops. The patient complained of pain in the right kidney, dizziness, and headache. He was ordered to have a warm bath, fifteen grains of Dover's powder at night, and a house-draught next morning. After a good deal of gentle manipulation, a No. 2 catheter was introduced, and a large quantity of highly offensive urine drawn off. The pain in the kidney still continuing, with head-symptoms, a mustard plaster was applied over the right renal region, and five grains of Dover's powder and ten grains of bicarbonate of soda were given every four hours. The patient was much relieved. After a lapse of four days, a No. 3 catheter was passed; and an instrument was passed every third or fourth day, until No. 8 catheter was reached. On February 7th, he was discharged, and made an out-patient. He had an instrument passed once a week for some time.

This case, one out of a number, is not given as anything new, but rather to call the attention of the profession to the different modes of treating stricture. Here we have a severe case cured by gentle dilatation, and those adjuvants which a hospital can most readily afford the poor—the warm bath, good diet, and rest.

Strictures are of frequent occurrence, and are met with in every-day practice. It will be worth while for practitioners to get the history of as many cases as possible, to enable them to come to a fair conclusion as to the best mode of cure.

ST. GEORGE'S HOSPITAL. On the fifth inst., certificates of prizes and honorary certificates were awarded. Sir Charles Clarke's Prize, to Mr. Thomas Edgelow and Mr. William Leigh. Mr. Henry Charles Johnson's Memorial Prize to Mr. F. W. Underhill and Mr. H. Ray Archer. General Proficiency, to Messrs. J. Forster, T. Edgelow, F. Sims, Howard Barrett, R. Anderson, W. Cant, and W. Tindall.

REMARKS ON DR. HERBERT DAVIES'S METHOD OF TREATING ACUTE RHEUMATISM.

By W. O. MARKHAM, M.D., F.R.C.P., Physician to
St. Mary's Hospital.

DR. HERBERT DAVIES recommends a new method* of treating acute rheumatic fever; viz., "exclusively by free blistering. He has lately systematically pursued this plan in the London Hospital. The treatment is absolutely local, without the aid of "alkalies, nitre, lemon-juice, bark, opium, colchicum, or, in fact, any of the internal remedies which are and have been considered as specific in that affection." The result, Dr. Davies says, is in all respects highly satisfactory. His theory of rheumatism is the ordinarily accepted one, that there exists in the system a *materies morbi*, consisting either of an excess of some normal element, or of a new product, intensely acid, and highly irritating to synovial and fibrous tissues. Upon the rapid expulsion of this element depends, in his opinion, the immunity of the patient from heart-disease. Thus arguing, and believing that the virus localised itself in the affected joints, he determined to try to eliminate it there, wherever it shows local signs of its presence, bringing it out bodily with the serum of the blistered surface. "Armbands, wristlets, thighlets, leglets, and even fingerlets (if I may be allowed to coin such words) of blisters, were applied near to, but not upon, every joint inflamed, at the very height of the inflammatory stage, when the local pains were most severe, and the constitutional disturbance the greatest.

Details of the cases (thirteen in number) on which Dr. Davies founds his opinion, are given in the *London Hospital Reports*. Since their publication, he has, he tells us, had further experience of the treatment, and has "obtained such valuable results as to lead him to hope that the plan suggested presents the most efficient means of rapidly subduing pain, limiting the duration, and diminishing the tendency to the production of cardiac disease."

A novel method of treating so formidable a disease as is rheumatic fever, and one so warmly recommended by an able and experienced observer like Dr. Davies, will naturally attract the attention of the profession; but I am sure no one will more readily admit than Dr. Davies that it must bear the test of experiment and much criticism before it become an accepted and established method of cure. Every man of medicine, alas! knows only too much, by sad experience, of excited hopes and fallen expectations in the matter of specific and sure cures of acute rheumatism, as well as of many other diseases. He, therefore, *festinat lenté*—is reasonably slow of trusting, even on such high authority, this last newly proposed remedy. Certainly the cases, thirteen in number, published by Dr. Davies as proofs of the good things he attributes to the remedy, are in my

opinion, if I may venture one, quite insufficient to prove his case. The main point, we suppose, to show of the efficacy of the remedy, is, that it prevents cardiac complications. But what satisfactory proof of such effect is given in these cases? No fewer than eight of these had signs of cardiac disease when admitted into hospital, and are therefore valueless, or nearly so, as indicators of the action of the remedy in preventing cardiac disease; so that, in reality, only five of the thirteen can be spoken of in this respect. But is it not a fact that, at the present moment, and under other (what may be called the ordinary) treatment of rheumatic fever, cardiac disease has of late become comparatively a rare occurrence? Besides, it must not be forgotten that certain individuals—young persons, for example, and especially young females—subjects of acute rheumatism, are much more liable to the cardiac complication than are grown-up men; and, therefore, in any estimation of the value of a remedy as a preventive of heart-affection, this fact must be duly taken into calculation. But no such allowance has here been made by Dr. Davies. Moreover, one important item—in my opinion, the most important of all—has been totally omitted in Dr. Davies's details: I mean the general management of the patient, and especially as regards keeping up the sweating by clothing him in blankets. According to my own experience, this general management of the patient is, of all remedial agencies, the most important and essential. No other remedy equally efficacious can be substituted for it. I have no hesitation in saying that I could produce just as good a list of successfully treated patients as is this of Dr. Davies, under the following simple treatment; viz., keeping the patient constantly and resolutely (for the patients often object to the discomfort of the thing) wrapped in blankets, and in a state of perspiration; giving Dover's powder for the purpose of maintaining perspiration, and in quantity sufficient to ease inordinate pain; keeping the bowels open and the kidneys in action by small doses of saline purgatives, mixed with liquor potassæ; applying occasionally a few leeches to any joint which may be especially painful; and swathing the joints in moist flannels; the diet being a mild milk one. I have in this way, and without the administration of alkalies or any other drugs (excepting a little coloured water, to satisfy the patient's fancy), treated the most typical cases of rheumatic fever as successfully as by any other method of treatment.

I once had great faith in the virtue of the alkaline treatment of acute rheumatism; but many broken hopes and failures in its use have long since led me to disbelieve in it as having any especial or specific efficacy. I rarely, in fact, now employ it.

It seems to me a very rational way of arguing, that, admitting there be a *materies morbi* in the system of the subjects of acute rheumatism, the best way to eliminate it is by assisting what seems the natural effort of the body to be rid of it; viz., the sweating. Cardiac complications were much more common in past days than they are now; and in those days the sweating was rather discouraged, as being hurtful, and as seriously weakening the body. I must, therefore, also venture to think that, touching the most important point in the treatment of this disease, Dr. Davies says nothing—i.e., he lays no stress upon it: I mean upon the encouragement of the perspiration.

The proposition, that the *materies morbi* is especially concentrated in substance in the inflamed joints, is, of course, at present an hypothesis—a reasonable, and, it may be, a true hypothesis. But, before proof, it is certainly just as rational a one, that the morbid element is distributed throughout the whole body—

* This treatment may fairly be called new in a relative sense; but I believe that blistering of joints suffering from acute rheumatism has been already often practised. About thirty years ago, for example, it was, I think, a common practice with Dr. Duncan in the Edinburgh Infirmary.

i. e., wherever the blood circulates; and, therefore, on the principle of treatment adopted in this case by Dr. Davies—viz., by the process of its elimination—it is assuredly as rational to encourage the elimination *per vias naturales*, that is, by the sudoriparous glands, as it is through the serum of the blistered surfaces of the inflamed joints. The serum of even many blistered joints must in amount be very greatly less than the perspiration morbidly excited by the disease, and actively encouraged by artificial means, from the whole cutaneous surface of a rheumatic patient.

The application of blisters to the joints, as recommended by Dr. Davies, may be certainly considered a good and rational proposition in the treatment of acute rheumatism, and will, no doubt, on his recommendation, be fully tried. But it should surely, at present, at all events, be only regarded as an adjunct to other and far more important treatment. To regard it, as Dr. Davies seems to do, as the *primum mobile* in the cure—as a sort of specific *methodus curandi* of acute rheumatism—is what I have here ventured to object to in my remarks upon Dr. Davies's papers.

ON CHOREA, AND ON NATURE AND ART IN THE TREATMENT.

By JAMES TURNBULL, M.D., Physician to the Liverpool Royal Infirmary.

[Read before the Liverpool Medical Society, December 1st, 1864.]

CHOREA, or St. Vitus's Dance, is well known as a nervous affection of spasmodic nature, manifesting itself by irregular contractions or twitchings of the voluntary muscles, which the patient cannot control. It occurs much more frequently in females than in males; and more commonly between the ages of 8 and 15 than in younger children or grown-up persons. Those attacked are not usually of strong constitution, but of nervous temperament and sensitive disposition; and fright is often the exciting cause. I have observed that in females it occurs most frequently just before the catamenial function is established; and, when it comes on after this, there is generally some menstrual irregularity, accompanied with more or less anæmia. I have also observed the occurrence of worms in connection with the disease; but intestinal irritation has not often appeared to me to be the sole cause.

The connection between chorea and rheumatism is one of the most singular facts in relation to this disease, and I have had many opportunities of observing it in private, as well as in hospital practice. We frequently see chorea coming on while the joints are swelled and painful from an attack of acute or sub-acute rheumatism, and it appears in such cases to supersede the rheumatic affection. Again, we see cases of chorea where the joints become swelled and painful from rheumatism, supervening or recurring. In either case, the one disease seems to take the place of the other. Besides this, we find that chorea occurs frequently in families where there is the rheumatic diathesis, one member being attacked with chorea, and others liable to rheumatic attacks. Choreia is a functional disorder, and in fatal cases no organic alterations which could be the cause of the disease have been discovered, but the organic effects which rheumatic fever produces on the heart and its valves have been not unfrequently observed. As we

have good reason to believe that rheumatism is produced by a *materies morbi* in the blood, the close connection between rheumatism and chorea suggests the inquiry whether the latter might not be dependent on the same or a similar cause. Some countenance is also given to such a theory, by the fact that when urea is retained in the blood in consequence of disease of the kidneys, there is a liability to convulsive and other nervous affections, and also by the fact that some poisons, such as strychnia, when introduced into the blood, excite spasm of the muscles.

With respect to the relation in which chorea stands to other diseases of the nervous system, I would observe that it bears to paralysis this relation, that we sometimes find in chorea not only that the patient is unable to use the muscles of the tongue so as to speak, but that it is impossible to use some of the limbs, owing to a kind of temporary imperfect paralysis. It bears also to paralysis this further relation, that in some cases one side only of the body is affected. Epilepsy is a more intractable and severe disease, attended with protracted muscular spasm and complete loss of consciousness, and ultimate injury of the mental powers, which never occur in chorea; but the absence of any traceable organic alteration of the brain or cord characterises both. As regards severity, chorea holds an intermediate place between epilepsy and hysteria, the convulsive form of which latter is more troublesome than dangerous. I have seen some cases, however, where chorea and hysteria approximated so closely, that they might not inappropriately be called cases of hysterical chorea.

Chorea is often a very trifling complaint, but it is also frequently a troublesome protracted disease, and in a few instances I have seen it prove fatal. It is then one of the most frightful diseases we can witness, causing violent contortions, and tossing the patient about in all directions, thus injuring and abrading all the prominent parts of the body, and causing rapid loss of flesh and death from exhaustion, owing to incessant motion and want of sleep. Whenever the patient sleeps, the twitchings cease, and thus the strength is renewed; but if the movements should be so violent as to preclude sleep, the prognosis becomes very grave.

The disease often begins with slight twitching, and gradually attains its highest degree of severity; but very severe cases may recover more rapidly than slighter ones. I had two cases under my care at the same time this summer which illustrate this; one was a girl of 12 years of age, who was brought regularly to see me at my house. Though the case was never very severe, it was much longer in recovering than the other, which was the most severe in which I have seen recovery take place. As to the duration of the disease, Dr. Hughes, in his digest of one hundred cases, tells us that, exclusive of the time the patients had been previously ill, it varied in Guy's Hospital from three weeks to three months, 40 per cent. of the cases being cured in from three to six weeks.

The general diffusion amongst medical men of the present day of a knowledge of the important fact that in all curable diseases there is a spontaneous tendency to recovery, is a distinguishing feature of our times; and, when combined with a due appreciation of the influence of art in promoting this object, such knowledge must exercise a most beneficial influence on practice. Sir John Forbes's little treatise is the only one in which we have a comprehensive examination of this subject, and whilst I would observe that I place a high value on the service which he rendered by his exposition of the power of nature in the cure of disease, I must add that I think the tendency of his work is to repress, and unduly repress, the progress of medicine in the direction of therapeutic inquiry.

I feel convinced, too, that if Jenner had not had a higher appreciation than this author of the powers of art, he would never have traced the operations of nature so as to make his grand discovery of the preventive power of vaccination, in which we have a beautiful illustration of art searching out and applying one of the powers of nature.

Like other curable diseases, chorea shows a natural tendency to spontaneous recovery; and Dr. Wilks, having treated some cases by diet and regimen alone, has advocated expectant treatment; and in a clinical lecture which he published, has endeavoured to show that other treatment is of comparatively little importance. "Where a malady," he observes, "can be cured by so many remedies, it may be very well left to itself, and can be placed in the same category as whooping-cough, and many other disorders which tend to a spontaneous cure." I would observe, however, that not only in disorders, but in all curable diseases, there is the same tendency to spontaneous cure. Without the assistance which has been known as the *vis medicatrix naturæ*, the physician would be powerless; and those are undoubtedly the safest and best practitioners who are the closest observers of nature's operations, and the most successful assistants in aiding her in her own methods of effecting recovery. But this principle applies as much to serious and acute diseases as to such nervous disorders as chorea and whooping-cough; and the tendency to spontaneous recovery may be quite as well, or better illustrated by referring to such acute diseases as pneumonia, the exanthematous fevers, and ague.

In the time of Sydenham, inflammation of the lungs and chorea were both treated by bleeding; and we know that in the former it was till a comparatively recent period repeated again and again *coup sur coup*, as if the only object of the medical man had been to wage war with the disease, instead of it being used as a means to promote the natural process of recovery—the only way in which it can ever be admissible as a therapeutic agent in this disease. Repeated bleeding we in the present day consider a violent, injurious, and unscientific interference with nature's operations; its moderate use may no doubt be so applied in some cases as to promote indirectly the natural tendency to recovery; but practically we know now that the great majority of cases of simple pneumonia may be far more safely and successfully treated by mild means—by eliminating and sustaining treatment, having for its object the promotion of the natural tendency to spontaneous recovery. In all the acute infectious diseases, we can as yet only assist nature in effecting a spontaneous cure, but there is a wide field here for the practical sagacity of the medical man in removing obstacles, and assisting her operations.

Ague is another disease in which we observe the same tendency to spontaneous recovery. Cases admitted into an hospital would in this country generally recover under the influence of diet, regimen, and warmth, just as in many cases of chorea. We do not, however, trust to these alone, for we know that in quinine we have a remedy which rapidly cures the disease, or, it may be, only promotes effectively the natural tendency to spontaneous recovery.

It would be easy to carry this comparison further; but let us turn to the practical question, whether we are, because many cases of chorea would recover by treatment by regimen only, to stand by and watch the case merely. The clinical observations of Dr. Wilks, to which I have referred, undoubtedly tend to this result, and are calculated to depreciate therapeutic inquiry, and thus to paralyse the search for more efficient remedies. "It is well known," he observes, "that there are fifty remedies against this disorder,

and even more than this number may be discovered, if it be worth while to collect them from medical writings." These and other remarks were made with reference to sulphate of aniline, introduced by me; and it is to be regretted that attempts should thus be made to depreciate therapeutic inquiry, which is one of much difficulty. In replying to the general question, whether we should merely watch the disease or not, I would express my opinion that, whilst we should in this, as in all other diseases, avail ourselves of the spontaneous tendency to cure, we may render valuable assistance by remedial means, and that such aid is often urgently needed on account of the disease being severe or protracted. Dr. Wilks does not, however, although an advocate of expectant treatment, entirely deny the efficacy of remedies; for he says: "It would appear to be true that tonics are useful, and that it is important to correct any morbid state of the alimentary canal." The mineral tonics, such as the preparations of iron, are undoubtedly the most generally useful remedies in ordinary cases of the disease; but where the usual means have failed, I have so often seen the disease removed by the direct sedative influence of sulphate of aniline, that I would still recommend a trial of it in such cases.

The following case is interesting, both as an illustration of what may be termed hysterical chorea, and as affording an example of successful treatment by this remedy, whether such result may be considered to have been due to its direct sedative influence on the nervous system, or partly to the mental impression it produced on the patient—an influence in the treatment of such cases which should not be overlooked.

A lady, aged about 25, was placed under my care on November 16th, 1861, on account of a peculiar nervous affection, from which she had suffered more or less for eight years. In the early period of her illness, she had been under the care of the late Sir B. Brodie, and had afterwards been under the treatment of several irregular practitioners, but without receiving permanent benefit. The nervous affection consisted of an inability to control the muscles of the right arm, and in a slighter degree those of the left. There was an almost constant contraction of the muscles of the right shoulder and arm, causing a painful fidgeting motion, and compelling her to hold the arm with the left hand. There was plenty of muscular power; but she could not regulate the movements so as to write or do any kind of work. In walking, she had not perfect control of her movements, and exhibited some of the peculiar jerking seen in St. Virus's dance. As regarded the general symptoms, the complexion was rather anæmic; the muscular development good; the tongue natural; the digestion pretty good; the bowels sluggish; the pulse quick; and menstruation regular, but scanty. The treatment was first directed to the improvement of the general health by the preparations of iron combined with ammonia, and by out-door exercise, the use of dumb-bells, etc. Warm hip-baths, with mustard, were given; sedative embrocations, with atropia, etc., were used to the arm and shoulder; and aloetic aperients were administered. By these means, the general health was improved; but no influence was produced on the nervous disorder.

On the 10th of January, after she had been nearly two months under the previous treatment, I prescribed sulphate of aniline in three-grain doses thrice a day. It produced blueness of the lips and face more rapidly than in any other case I have seen; and, in other respects, she seemed peculiarly sensitive to the influence of the remedy, which always produced in the evening, after the third dose, not only decided

blueness, but also nervous depression, discomfort at the epigastrium, slight headache and palpitation, quickness of pulse, and coolness of the hands. At the same time, it had a marked beneficial influence on the disease; the muscular irritability was rapidly diminished, and she regained the control of the right hand and arm. The depressing effect of the remedy made it necessary to watch carefully its action, and to reduce the quantity to two doses daily. It was continued for three weeks, with occasional intermission for a day; and she had then completely regained the control of all her muscles, and could play on the piano. The blueness in this, as in all cases, went off within twenty-four hours after laying aside the remedy. About the middle of February, she had some return of the nervous symptoms, which soon yielded to the same treatment; and, at the end of the month, she returned home quite well.

Aniline has a powerful influence on the nervous system when taken internally, and still more when inhaled. From being accidentally inhaled, it has in several instances produced serious poisonous effects, though it has not been known to cause fatal effects on man. In recommending it as a remedy in chorea, I advised that the sulphate should be given in doses of two or three grains; and that it should be diminished or omitted when it produced the depressing effect, which is usually experienced in proportion to the temporary blueness of the surface it causes.

Dr. Frazer, who published some cases in which he gave it unsuccessfully, appears to have administered it in a different way—in large and increasing doses, as sulphate of zinc has sometimes been given—and as if his object had been to test its toxic as much as its therapeutic effects. In one of his cases, he tells us that the patient took twenty-eight grains daily. In thirty-four days, the quantity taken was four hundred and six grains; and it was continued all this time, although it caused frontal pain and aggravated deafness. "The result," he observes, "points nevertheless to the inefficacy of sulphate of aniline in five cases; and is, therefore, *pro tanto*, a clinical fact to be noted." I believe that any agent which produces a violent impression on the nervous system may prove injurious in this disease; and I advised the employment of aniline only so as to produce a gentle sedative influence; and, as not one out of five cases thus treated in hospital improved or recovered under this mode of treatment from a disease which Dr. Wilks has shown that many patients get well of under regimen only, the result would seem to show further, that thus given, as an antidote against the disease, it may prove not merely inefficacious, but injurious.

Having referred to the toxic properties of aniline, I would here observe that they have been erroneously regarded as of similar character with those of a more highly narcotic agent—nitro-benzine—which has very noxious properties, but has nevertheless been much used for flavouring and in perfuming, on account of its resemblance to the oil of bitter almonds. The effects of aniline and nitro-benzine have been confounded together from these circumstances. When aniline is introduced into the system, it undergoes oxidation, by which the mauve colouring matter is produced, as I was the first to point out. When nitro-benzine is introduced either through the stomach or by inhalation of the vapour, a portion is first converted into aniline, and this again undergoes further change, so that the same blueness is caused by both. The effects of nitro-benzine are, however, essentially different, and more persistently narcotic than those of aniline, as has been shown by Dr. Taylor in *Guy's Hospital Reports*, in a recent paper in which he has fully examined the various

cases in which the toxic effects of these agents have been known to be produced; and he has recognised the difference in the effects of aniline and nitro-benzine. There is one fact, however, which appears to have escaped attention. It is this: that nitro-benzine is one of a series of chemical compounds which have similar effects on the nervous system. They are the xyloids—a series of substitution compounds formed by the action of nitric acid on starch (xyloidine), on sugar (saccharoine), on cotton (pyroxiline or gun-cotton), on glycerine (glonoin or nitro-glycerine), and on benzene (benzoine or nitro-benzine). Organic compounds containing nitrogen have often a powerful influence on the animal economy, as is the case with the vegetable alkaloids; and these are all nitrogenous compounds of similar chemical constitution.

Dr. Edwards, in a paper on the Physiological Properties of Xyloids, published in the *Liverpool Medico-Chirurgical Journal*, first drew attention to the action of these agents, and showed that they have similar and peculiar effects on the nervous system: the amount of their action being, in a measure, proportioned to their solubility. "They all appear" (he says) "to possess, more or less, the peculiar action on the nervous system characteristic of strychnine; and I believe that further experiments on men would prove that they possess peculiar and valuable medicinal properties. Physically, they are allied; being all highly explosive bodies, deflagrating at a low temperature or by concussion; and physiologically, they all produce a powerful effect on the heart's action, trismus, and a series of tetanic convulsions, terminating in death."

Having witnessed most of Dr. Edwards's experiments, I have taken this opportunity, of not only pointing out that nitro-benzine is different in its effects from aniline, but that it is one of the xyloids, and that to Dr. Edwards the merit is due of first ascertaining the poisonous properties of nitro-benzine, as well as its relation to the other xyloids.

Looking at chorea in a strictly practical point of view, I would now make a few remarks on the general treatment of the disease. In cancer, which is one of the most incurable diseases, many remedies have been, and will no doubt continue to be, tried; and in chorea, which is one of the most curable, many remedies have likewise been tried. Mere number points, in reference to the first, to its intractable nature; and, in regard to the second, to the fact that, though generally a curable disease, none of the remedies in use can be relied on to control the disease with any certainty. Indeed, practically, we know that there are cases which for months, and even years, resist both judicious and expectant treatment; and, therefore, the study of therapeutics in reference to this disease is still worthy of attention.

The remedies which have been chiefly used are, purgatives; the mineral tonics—iron, zinc, and arsenic; cod-liver oil; electricity; and the shower-bath. Purgatives I have given only when the state of the bowels rendered their use necessary; and not, therefore, with the curative intention with which they have sometimes been administered. The mineral tonics undoubtedly exert a beneficial influence. I do not believe they have any direct curative power; but they improve the general health, which is more or less below par, and thus they appear to lessen the excitability of the nervous system. Iron I believe to be the most generally useful, and especially in anæmic females. Dr. Hughes, in his digest of one hundred cases, makes these remarks:

"The different mineral tonics are very variously estimated by different practitioners, and one is often regarded as especially suited to the cure of chorea.

While one practitioner regards arsenic as a specific for true chorea, another cures nearly all his cases with the sulphate or the oxide of zinc, and another considers the sulphate or the carbonate of iron as an almost infallible remedy. This may perhaps arise, in a great measure, from habit. It is possible that all may be nearly equally efficacious. I have seen each of these, and many other remedies cure the complaint; and I have seen them all occasionally fail.*

Zinc has been given in large doses, especially at Guy's Hospital; where Dr. Hughes has stated that thirty-six grains of the sulphate have been administered daily. It appears such an abuse of medicine, to prescribe these enormous doses of an irritant drug commonly used in such quantities as an emetic, that we are at loss to discover how it should ever have been thus given. What Sir John Forbes has termed the autocracy of Nature, could not have been understood by those prescribing it in such a manner; and Dr. Hughes observes:

"In the practice of the hospital, I am not aware that it has been shown that small or moderate doses of the mineral, continued an equally long time, will not effect a cure."

In my own practice, I have used iron and arsenic more frequently than zinc; and I consider that, of the metallic tonics, iron is the best, and that arsenic stands next to it.

Cod-liver oil is a remedy which is sometimes of service, by improving the general health; and it may be given with, or subsequent to, the preparations of iron. Electricity seems, in some cases, to have acted beneficially, and in a very rapid manner.

The shower-bath is a remedial agent which gives tone to the system, and may be used along with other tonic treatment. I have seen it of the greatest use in many cases. In the case of a young lady, in whom the movements were incessant and violent, and prevented sleep, the movements subsided very much directly after the bath, and she soon fell asleep, and ultimately recovered. The emaciation and exhaustion of the patient from the incessant violent movements and the loss of sleep, had rendered the recovery of this patient very doubtful.

It is not less important to glance now at the means which may prove detrimental, and which should therefore be avoided in the treatment of this nervous affection. All violent impressions on the nervous system should be guarded against. We know that fright is not an unfrequent cause of the disease. It is probably on this account that the shower-bath may prove injurious when injudiciously employed, as well as very frequently useful. Narcotic remedies, such as opium, morphia, and hyoscyamus, have appeared to me (contrary to what might be expected) to be not simply useless, but positively hurtful. It has been said that chloroform is of use; but I saw the inhalation tried in two very severe cases, which proved fatal; and though it produced a temporary sedative influence, it appeared to me to act injuriously on the general progress of the disease.

In all cases, due attention should be paid to hygienic as well as medicinal treatment, so as to improve in every way practicable the nutritive functions and the general health. The diet should be nutritious, and wine or malt liquors are often of service; and out-door exercise is desirable in the less severe cases. When the disease proves chronic, change of air is advisable; and in the summer the change may be made with advantage to the sea-side, where sea-bathing may be practised.

ON THE PHYSICS OF DISEASE, AND THE PHYSICAL PATHOLOGY OF THE BLOOD.

By BENJAMIN W. RICHARDSON, M.A., M.D., Senior
Physician to the Royal Infirmary for Diseases
of the Chest.

CHAPTER II.

The Force evolved in Oxygenation of Blood. Conditions of Oxygen and of Blood that modify Combination. Modifications of Oxygen—Ozone. Influence of Temperature.

I REFERRED in my last chapter to the two modes, external and internal, by which force or motion is communicated to the body. When we view the subject free from all prejudice and all superstition, we are driven to the conclusion that by none other than the means there described can motion be supplied. To presume that the nervous system can generate motion, that it can out of nothing produce something, is like saying that a galvanic battery may work a telegraph without chemical action. The nervous system is the centre of forces derived from without and within—the *tabula rasa* on which the external world is written—the centre in which motion derived from the blood is laid up, to be applied in volition. But, beyond this, the nervous system is not different from other parts of the physical organism.*

Let us then consider the source of that motion which springs from within the body; which, in better words, is evolved in the body; which gives animal power, but does not give intelligence; which makes the animal an engine, but not an animal; which is constructive and locomotive, but not animating; but which yet prepares the machine for animation, and without which there is no life.

This force or motion is elicited by the combination of the oxygen of the air with the carbon derived from the vegetable kingdom, and present in solution or suspension in the blood. We speak of the force thus evolved as primary in respect to the body, and so it is; but, in truth, we may trace it back further—at least, to the sun.

When the sunbeam falls on the vegetable world, when the radiant motion from the sun touches the vegetable world, that chemical change takes place in the leaf of the plant which is described as consisting of the decomposition of carbonic acid, the evolution of oxygen, and the fixation of carbon. This is the chemical part of the change that takes place; but there is a physical part played as well. The motion derived from the sun is also fixed, to be laid by until it is required, until the time has come when, by the recombination of oxygen with carbon, it shall be set at liberty in the form of heat, as heat of fire, or heat of body. Thus the force that supplies the organism with the motion that pertains strictly to its organic or vegetative life is conveyed into the body as coal is conveyed to the fire, through the vegetable world—conveyed as fuel to the furnace, and as food to the animal. Plants are condensers of motion for man; they take up from the earth the dead matter; they take from the sun motion; they endow the dead matter with motion; and, thus endowing it, they become to the animal constructively and actively as matter and motion.

When distributed through the blood, the carbon from the plant meets, in infinite subdivision of mole-

* In a paper read before the Medical Society of London in the beginning of 1863, I described the nervous system as the *condenser* of motion.

cule, the oxygen of the air, that being also in infinite subdivision: then those processes which took place when the sun's motion touched the plant, are reversed. Carbon and oxygen reunite; carbonic acid is reformed for the plant; and motion—heat—is evolved. Nor is the motion merely evolved to the body, but through the body it is given forth again to the universe in act—nay, in thought. This that I write is so much motion fixed through matter on the page; and when the reader, in presence of light, takes it up and reads it, it reaches him as motion liberated and carried to the eye by light, another form of motion.

To maintain a perfect balance of motion, either in the vegetable or animal world, there are conditions necessary, a departure from which is at once followed by organic change. If we deprive a vegetable of the chemical radiations of the sunbeam, we destroy, to the extent of the deprivation, the absorption of motion; or if we deprive the plant of its green colouring matter, we destroy, to the extent of the deprivation, the reception of motion. On the other hand, if we deprive an animal of oxygen, we destroy, to the extent of the deprivation, the liberation of motion; and, if we deprive it of food, we do the same thing.

This is simple enough; and, in the case of the animal, we see the phenomenon almost daily of death or cessation of motion from mere deprivation of oxygen, or from mere deprivation of food or blood. We see the first in what is called asphyxia; the second, in what is called hæmorrhage.

But between perfect combination, or health, and stopped combination, or death, there are numerous gradations, depending either on modifications in the conditions of oxygen alone, of blood alone, or of both oxygen and blood. In the presence of these modified conditions, the animal combustion is not suspended, but lessened or increased, with, in some instances, the production of new products of combustion which are foreign to the organism. These modified conditions are the causes of those various groups of symptoms which we call diseases; and on them all diseases rest, except a few, of which I shall speak in a future chapter, and which are mechanical in their origin, such as intussusception, hydatid disease, and some kinds of external injury.

MODIFIED CONDITIONS OF OXYGEN.

Let us turn first to oxygen, and ascertain what are the modified conditions under which it fails to sustain in proper degree the animal fire.

In order that oxygen should combine with blood, it is an essential condition that its molecules should be distributed, held apart from each other, and possess in themselves motion; hence a given external temperature is necessary for the oxidation of blood. In the next place, it is essential that the oxygen should be diluted in nitrogen; for, if this did not obtain, variations of temperature would lead to sudden and immediate consequences of the most serious kind. A fall in temperature below 35° Fahr. would stop combustion altogether; an elevation in temperature to 110° Fahr. would give rise to fatal combustion from excess of action. In the third place, the oxygen must be presented to the lung in the neutral form. Raised in action by being, in very minute proportions, transformed into ozone, it is unfitted for respiration: it becomes an irritant to the mucous membranes over which it passes to the blood, a quickener of action, and, by this quickened action, a disorganiser of the blood. Reduced, on the opposite side, to a negative condition, it fails in combining power, so that the blood exposed to it is unable to supply sufficient motion to the organism to sustain the functional activity.

In order to determine the effects of modified condi-

tions of oxygen on the combustion of blood, I have conducted two series of inquiries. In one series, animals have been subjected, while they were yet in motion—i. e., living—to oxygen in various states; in another series, blood that has been removed from an animal has been subjected, spread over a very wide surface, to oxygen in various states. It will be best to first direct attention to the results of experiments on the living process.

INFLUENCE OF HEAT ON OXYGEN.

By motion in the form of heat, oxygen gas is held in varying conditions for combination; the rule being that the expansion of the gas by heat, within ordinary natural temperatures, quickens the process of oxidation in animal bodies.

In order to see the influence of varying degrees of heat on oxygen, in relation to its power as a supporter of life, it is best to place animals in an atmosphere of pure neutral oxygen, and then, the gas used being always taken from the same source, to cause its inhalation under varying degrees of temperature. By this method a series of results are obtained, on similar classes of animals, so uniform, that we may consider we have in our possession the main facts bearing upon the subject in a physiological point of view. My own inquiries have been conducted on rabbits and mice. In subjecting the rabbits to experiment the oxygen was breathed by the trachea; and in order to produce various temperatures of the gas inhaled, the tube leading from the jar of oxygen to the animal passed through thirty-six feet of thin metallic tubing, which, being coiled, could be immersed in a bath containing water at various temperatures, or ice and salt: by these means I could reduce the oxygen to 20° Fahr., or raise it to 140°. In subjecting the mice to experiment, they, being small animals, were placed in chambers of known capacity, charged with oxygen and very carefully closed: by a simple arrangement the animals could be introduced into these chambers without water and without the admission of air. The chambers being thus prepared, the temperature of the air within them was modified by placing them in water heated or cooled to the degree required, ice and salt being used for the lowest temperatures. A thermometer in the chamber with the animal told the temperature of the enclosed air; and a very simple valve regulated the pressure of the gas, allowing escape when there was expansion, and means of entrance for oxygen when the extreme of cold was being applied.

When experiments constructed on the basis given are performed with exactness and without hurry, the uniformity of result is remarkable. I began by studying the effects of a low temperature, reducing the thermometer to 20°-25° Fahr. by means of ice and salt. I found that oxygen thus reduced was destructive both to the rabbits and the mice, in periods varying from fifteen to thirty minutes. The mice in all cases lived the longest, a result due probably to the mode of administration. The form of death is always the same; the animals became drowsy, and then slowly and regularly the action of the heart declines: there is no excitement of the heart first—no fluttering; it is a gradual arrest of motion; each minute brings two or three beats less, and so down and down, until the organ is quite at rest.

The animals die in these experiments because, under the influence of the cold, the combining power of the oxygen with the blood is reduced. I thought at one time it might be that the cold, by producing contraction of the capillary vessels of the lung, was the cause of death; and I, therefore, varied the experiment by subjecting animals to oxygen diluted as in air, but at the same reduced temperature. The

result was that, in the diluted oxygen, a rabbit breathing by the trachea would live one-third longer than another one would by breathing oxygen alone. Two rats placed in similar chambers, and exposed to the same temperature, were also tested; one being subjected to pure neutral oxygen, the other to common air. The rat in oxygen had ceased to breathe in half an hour; the rat in air continued to breathe slowly and stertorously for nearly two hours: taken out at the end of that time, it was as insensible to all pain as though it were profoundly narcotised with chloroform, the cold producing *general* anæsthesia, as by Dr. James Arnott's beautiful process it is made to produce *local* anæsthesia. A three-inch spark from the large induction coil, passed through the limbs, produced no contraction; and yet, by very gradual exposure to warmth, the animal recovered.

It is not, therefore, from the mere constringing influence of cold exerted on the capillaries, that animals in pure oxygen die at low temperatures, although this, as a secondary cause, is important; it is that the abstraction of caloric from oxygen is more rapid and perfect when the gas is pure; diluted with nitrogen, as it is in air, the molecules of oxygen are not so readily brought within the sphere of attraction for each other, inasmuch as the nitrogen shares with the oxygen the abstraction of heat. In this sense, nitrogen in the air does more than simply dilute oxygen: it equalises it in action during extremes of heat and cold.

From temperatures ranging from 20° to 25° Fahr., I passed to those ranging from 50° to 55°, subjecting animals, now in closed chambers only, to oxygen, neutral and pure. In these cases, in the same chambers, and breathing gas derived from the same source, the animals, instead of dying in thirty minutes at most, lived four hours—rather more than two hours longer than they would have lived had they been placed in the same volume of common air at 55° Fahr.; for, although animals in oxygen, as in air, become comatose at the same periods, those in air die so soon as they have become comatose, while those in oxygen live for more than twice the same length of time.

From 50°-55° Fahr., we pass to 70°-75°. Using the same chambers, using oxygen derived from the same source, and using animals of the same kind, I placed the animals in the chambers, and only modified the experiment by putting the chambers in such position that the thermometer told off a temperature within them of 70°, rising occasionally to 75°, but soon reduced. In this case, the animals remained conscious for three hours; then they became comatose; but they continued to live for so long a period as twelve hours.

At temperatures of 80°-90°, and even 100°, the effect produced on oxygen is not remarkably different from that observed in the last named experiments; but beyond 100° the difference is very great. If the chamber containing the animal exposed to pure oxygen be placed so that the contained gas be gently raised to 125° Fahr. (expansion of course being provided for), the animal lives for a period of fifteen minutes, breathing quickly, and becoming in the transparent parts of its body intensely red in colour; at last, the redness quickly subsides into a purple tint, after which the animal falls unconscious, becomes tetanically convulsed, and in the course of three or four minutes dies.

It might occur to the reader, that the effects produced in the animals placed in confined chambers were due to the accumulation of carbonic acid. To remove this impression, it is necessary to direct attention to the air remaining in the chambers. In the chambers containing the oxygen inhaled by the animals at 20°-25° Fahr., the consumption of the gas

by combustion is so small that only the mere presence of carbonic acid can be detected. To test the supporting power of this oxygen, I placed in a chamber containing it, after the first animal was dead, a second animal. I then gradually transferred the chamber from a temperature of 25° to a temperature of 70°. In another chamber of the same size, and filled with fresh oxygen, I placed a second animal, also at 70°, the chambers standing side by side. The two animals became comatose at the same time, and died within six minutes of each other; the one that had been placed in the chamber containing the dead animal dying first.

In a chamber in which an animal has been exposed to oxygen at 55°, the amount of gas consumed is also remarkably small. In a comparative experiment, in which two animals were subjected, one to pure oxygen, the other to common air, each chamber being of the same size, and the temperature being regulated in both at 55°, I found the animal that died in air had produced, although it breathed for two hours less, five times the amount of carbonic acid. But in a chamber in which an animal had breathed the gas for twelve hours at 70°-75°, the amount of carbonic acid, after the death of the animal, was found equal to that which was obtained from the respiration of the same quantity of common air by another similar animal. In fact, the animal in this case dies, although after a period six times prolonged, in the same manner as after the inhalation of the same volume of common air—viz., from the accumulation of carbonic acid.

In chambers in which animals die from breathing oxygen at 125°, the amount of carbonic acid is variable: it is always greater than would be developed from air respired during the same period, but all the oxygen is not consumed; and the jar, after the animal is dead, contains as much as will sustain, at a temperature of 70°, another animal for two hours.

Thus we see that extremes of heat and of cold render oxygen incapable of supporting life. The low temperature prevents, the high temperature overquickens, oxidation; while, at mean temperatures, the pure gas sustains for a long time a slow process of oxidation, during which the organic, as apart from the conscious life, is maintained; during which just sufficient motion is generated from combustion to support the heart and respiration, but none is made to be stored up in the nervous centres.

In my next chapter, I shall describe at some length certain new experimental facts relating to active oxygen—ozone—in regard, specially, to its effects on the organism.

BEQUEST. Edward Yates, Esq., leaves by will so much of his property as may legally be applied to charitable purposes to University College, London, in trust, to apply one moiety of the annual income thereof to the general purposes of the North London Hospital, connected with that college, and the other moiety to the Samaritan fund for the relief of poor patients. The residue of personal property is left to Dr. C. J. Hare, one of the executors.

DEATH OF DR. BAIKIE. Sir R. Murchison announces that Dr. Baikie died at Sierra Leone, on November 30th, of fever and dysentery. The death of this good and distinguished man will be as deeply deplored by geographers and naturalists who have been daily looking out for his arrival in England, charged as he was with much important knowledge and rich collections relating to the interior countries on the banks of the Niger, as he will be by the government which he served during nearly eleven years with so much ability and zeal in carrying out his arduous mission.

Reviews and Notices.

MEDICINES, THEIR USES AND MODE OF ADMINISTRATION. By J. MOORE NELIGAN, M.D. Sixth Edition, including a Complete Conspectus of the *British Pharmacopœia*, an Account of New Remedies, and an Appendix of Formulæ. Edited by RAWDON MACNAMARA, M.R.I.A., Licentiate of the Royal College of Physicians, etc. Pp. 758. Dublin: 1864.

A MANUAL OF MATERIA MEDICA AND THERAPEUTICS, including the Preparations of the *British Pharmacopœia*, and many other Approved Medicines. By J. FORBES ROYLE, M.D., F.R.S., and FREDERICK W. HEADLAND, M.D., B.A., F.L.S. Fourth Edition. Pp. 776. London: 1865.

ELEMENTS OF MATERIA MEDICA: Containing the Chemistry and Natural History of Drugs, their Effects, Doses, and Adulterations; with Observation on all the New Remedies recently introduced into Practice, and on the Preparations of the *British Pharmacopœia*. By Dr. WILLIAM FRAZER, Lecturer on Materia Medica to the Carmichael School of Medicine; etc. Second Edition. Pp. 453. London and Dublin: 1864.

A COMPANION TO THE BRITISH PHARMACOPŒIA, comparing the Strength of the various Preparations with those of the London, Edinburgh, and Dublin, and other Pharmacopœias: with Practical Hints on Prescribing. By PETER SQUIRE, F.L.S., Chemist on the Establishment of the Queen, etc. Second Edition. Pp. 256. London: 1864.

WE have already had occasion to notice several works, or new editions of works, on materia medica and pharmacy, which have appeared in consequence of the publication of the *British Pharmacopœia*. There now lie before us the books whose titles are given above; and we also understand that an abridgement of Dr. Pereira's voluminous and elaborate work is in course of preparation by Drs. Farre and Bentley, and Mr. Warrington.

The first work on our present list, that of the late Dr. NELIGAN, has enjoyed a high reputation as a text-book during the last twenty years, and has now reached a sixth edition. The joint editor, Dr. MACNAMARA, states in the preface that, for some time previously to the lamented death of the author, Dr. Neligan, he had been associated with him in preparing the present edition. Its final revision was delayed, however, until the appearance of the *British Pharmacopœia*; "Dr. Neligan, although on the Pharmacopœia Committee, from a high sense of honour, steadily refusing to avail himself of his position, or to make any private-personal use of the proofs of that work, which from his position had to be constantly submitted for his inspection." Hence, Dr. Neligan's death having taken place some time before the *Pharmacopœia* was published, the completion of the book devolved entirely on Dr. Macnamara, who has performed his task in such a manner as fully to sustain the previously acquired reputation of the volume.

This sixth edition of *Neligan on Medicines* contains above three hundred pages more than the first edition, published in 1844; and, on the present occasion, Dr. Macnamara informs us that the greater

part of the space gained from previous editions, in consequence of it no longer being necessary to reproduce the formulæ of three separate Pharmacopœias, has been devoted to original matter.

The book contains not only the medicines and formulæ of the *British Pharmacopœia*, but also many which are not official in that work. Hence it has devolved on Dr. Macnamara to make considerable additions and changes. Among the additions which he has made are full explanations, both verbally and in equations, after each process and test; and a sufficiently ample and clear exposition of the use of test-solutions for volumetric analysis. The posological table is retained, and is arranged in four columns, containing respectively the name of the medicine, the dose for an adult, the dose for a child aged one year, and the form of administration.

The peculiar arrangement originally adopted by Dr. Neligan, and retained in all subsequent editions, is, as many of our readers are probably aware, different from that followed in most other works of the same class. It is based on the actions of remedies; the chapters being headed respectively Antacids, Anthelmintics, Antispasmodics, Astringents, etc.; and the medicines in each class being described in alphabetical order. Hence it sometimes happens that, for the full description of any given medicine, the reader must turn to two, three, or even more, separate parts of the work. In some respects, this plan is inconvenient—at least, we have occasionally found it so; but the author and the editor have doubtless had very good reasons for this arrangement, and any inconvenience arising therefrom is of very light weight in comparison with the excellence of the information contained in the book.

We next come to a work which, like the one above mentioned, bears on its title-page the name of one who has passed away. The *Manual* of Dr. ROYLE, forming one of Mr. Churchill's well known and admirable series, has been given into the charge of Dr. F. HEADLAND to revise and renew. Dr. Headland has, like his fellow-labourers, modelled the work on the *British Pharmacopœia*; but he also retains, marking them by brackets, various medicines and preparations mentioned only in the *London Pharmacopœia* of 1851.

The plan of arrangement adopted in this work is that of the three divisions, mineral, vegetable, and animal; the articles in the latter two classes being arranged under the natural orders.

Useful information on various subjects—such as the relation between natural orders of plants and medicinal properties—is given; and at the end is a chapter on the Physiological and Therapeutical Arrangement of the Materia Medica, for which, we believe, we are indebted to Dr. Headland. Having briefly noticed the classifications proposed by various authors, he, retaining that of Dr. Royle, arranges medicines under the heads of Mechanical, Chemical, and Vital. The *Mechanical* remedies are diluents, demulcents, and emollients; the *Chemical*, escharotics, acids, alkalies, antilithics, disinfectants, astringents, and antidotes. The *Vital* agents include the various evacuants or local stimulants, general stimulants, and depressants. Some remarks are made on each class, and a list of the medicines contained in it is appended. Now, with all deference to Dr. Headland, we consider that his retention of the term "vital" to express an idea of the action of many of

the medicines mentioned is by no means an act of progress. Even if we must—and we no doubt must—retain the word to designate that of which we have not as yet a definite conception, still it seems out of place to arrange under “vital agents” such articles as the saline diuretics and cathartics. Even the narcotics and sedatives, which, as the researches of Snow and others tend to show, probably act by interfering with the oxygenating process, are scarcely in their proper place here. Dr. Headland, indeed, acknowledges that some of the so-called vital agents undoubtedly act chemically. We hope that, in future editions, he will more fully recognise this; and cease to use a term of mystery in speaking of the action of medicines, regarding which it is tolerably well ascertained that they act chemically, or physically.

What else he has done in the book, is very creditable. He has maintained for it the reputation which its talented author ensured for it.

The third book on the list comes, like Dr. Neligan's, from Ireland. Its author, Dr. FRAZER, informs us that this second edition of his work was retarded by the delay in the appearance of the *British Pharmacopœia*; and that he has re-written the book, so as to include in it the latest additions to *materia medica*.

The plan of arrangement which Dr. Frazer adopts is founded on the natural history of the various medicines. In the first part, he gives the Chemical *Materia Medica*, which, after an introduction, is divided into inorganic substances, compounds of cyanogen, alcoholic and ethereal preparations, and hydrocarbons. To this part is appended an useful chapter on Volumetric Analysis.

The second part consists of the Vegetable *Materia Medica*, arranged according to natural orders—commencing with Ranunculaceæ (to which belong Aconitum and Podophyllum), and ending with Algæ (of which Chondrus Crispus, or Carrageen Moss, is the representative). The third part contains the articles of the *materia medica* derived from the Animal Kingdom. And, in a supplement, the author gives an account of preparations used in medicine, but which are not official, nor described in the preceding portions of the work, such as aniline, apiol, bromide and iodide of ammonium, iodide of sodium, carbazotic or picric acid, oxalate of cerium, chlorodyne, datura tatula, Donovan's solution, the hypophosphites, effervescing carbonate of iron, peroxide of hydrogen, &c.

The nomenclature adopted is, whenever practicable, that of the *British Pharmacopœia*.

The descriptions are clear and concise; and the book is one which is likely to meet with much favour. As a text-book, many will find it useful.

Mr. SQUIRE has brought out a very useful *Companion to the Pharmacopœia*, supplementing much of the deficiency of the latter work, and removing its difficulties. Following the simple alphabetical arrangement of the *British Pharmacopœia*, he gives regarding each article a concise description of its physical and chemical characters, its properties, and its preparations; and specifies the formulæ by which preparations of the same name with ours are made in various foreign countries, and also the names by which our pharmacopœial articles are there known. His object in doing this, is “to enable prescribers to regulate the prescriptions of patients going abroad,

where preparations similar in name but different in composition may be employed.”

Mr. Squire has found the system of weights adopted by the Medical Council very inconvenient; and his opinion on this point, as a practical pharmacist of the first rank, deserves great attention. As an example, he says: “If we take the formula for Compound Tincture of Benzoin, and wish to prepare half a gallon, it will be necessary to multiply the grains of each ingredient ordered by 4, and to divide the number thus obtained by 437.5, to reduce it to ounces.” To overcome this difficulty, Mr. Squire has generally expressed the formulæ in parts, which may be pounds, ounces, or any other weight, English or foreign, according to the quantity which it is desired to use or make. We will give one or two examples of Mr. Squire's plan.

“CALOMELAS. Calomel. *Syn.* Hydrargyri Submurias: Hydrargyri Chloridum. Subchloride of Mercury, Hg²Cl; eq. 235.5. A dull white, heavy, and nearly tasteless powder. Insoluble in Water or Rectified Spirit.”

Then follow, concisely, the tests and medicinal properties.

“Dose.—As an alterative, $\frac{1}{2}$ to 1 gr. three times a day; as a purgative and cholagogue, 2 to 8 grs.

“(In all the *Pharmacopœias*; Lond., Hydrargyri Chloridum; U.S., Hydrargyri Chloridum Mite; Fr., Hydrargyrum Chloratum Mite.)”

Then, under the head of Preparations, is given, *cum aliis*,

“PILULA COMPOSITA. Calomel, 1; Sulphurated Antimony, 1; Guaiac Resin in powder, 2; Castor oil, 1; mix—(1 in 5).

“(Same as Lond., Edin., and Dub.; Belg., Pil. Alterans Plummeri, 1 in 3; U.S., Pil. Antimonii Comp., 1 in 6; not in others.)”

Again, under the preparations of Senna, we find the confection ordered to be made as follows.

“Senna, in fine powder, 7; Coriander, in fine powder, 3; Figs, 12; Tamarinds, 9; Cassia Pulp, 9; Prunes, 6; Extract of Liquorice, $\frac{3}{4}$; Refined Sugar, 30; Distilled Water, 2 $\frac{1}{2}$; etc.

“(Same as Lond.; Edin., without Cassia and Tamarind; Dub., with Oil of Caraway, but without Liquorice and Figs; Belg., Electuarium Sennæ Comp.; Fr., Electuaire Lénitif, more complex; not in others.)”

Again, under the *Infusum*, there is the following.

“(Same strength as Dub.; Lond., 2 in 20; Edin., 1 $\frac{1}{2}$ in 20; Belg., 1 in 10; Austr., Inf. Laxativum with Manna, 1 in 8; Fr., Composita, 1 in 8, with Manna and Rochelle Salt; U.S., with Coriander, 1 in 16; not in others.)”

We must not omit to mention that, in addition to the matter proper of the work, Mr. Squire gives tables of the equivalents of English and French weights, lists of test-solutions, ordinary and volumetrical, etc.

The book is not only valuable to the manufacturing druggist and dispenser, but also to the prescriber. That it has been found so, is evident from the favour with which it has already been received.

PROFESSOR SENATOR MATTEUCCI has been nominated Professor at the Florence Museum, and will there give a course “On the Physico-Chemical Phenomena of Living Beings.”

WE beg to remind the members of the Association that the annual subscription is now due. Payment of the same can be made either to the Honorary Secretaries of Branches; or to the General Secretary, T. Watkin Williams, Esq., 13, Newhall Street, Birmingham.

British Medical Journal.

SATURDAY, JANUARY 14TH, 1865.

THE SANITARY IMPROVEMENTS OF BOURNEMOUTH.

THE frequency with which our friends and patients who go to English watering-places in search of health are attacked by severe and even fatal illness, has of late years become so alarming as to make us hesitate in recommending change of air. Nothing but the powerfully deodorising and antiseptic properties of the sea air saves some of the places of resort to which we allude, and which we will not at present name specifically, from devastating epidemics. Many of our readers must have a painful recollection of the stinks which, during the recent vacation, have met them at every turn in localities formerly celebrated for their health-giving properties, but now poisoned by the effluvia which the carelessness of an ignorant or penurious population has allowed to be generated and to accumulate in or near their dwellings. We should have thought that the constant publicity given to the fundamental rules of sanitary science would, by this time, have penetrated to the most obtuse of municipal law-givers; or, at least, we would have given this money-getting age credit for discerning the necessary connection which exists between the pecuniary interests of the permanent denizens of a watering-place and its sanitary condition. Experience, however, has shown that, with a few well marked exceptions, the teachings of sanitary science and of political economy have been equally thrown away upon the short-sighted rulers of many of the places which, with the present facilities of communication, might go far to become perfect sanatoria.

There is one place on the south coast of England to which we may be permitted to draw attention at present; not for the purpose of finding fault, but with a view to strengthening the hands of those of its residents who, appreciating the demands of the times and their own opportunities, wish to secure for it a prominent place among the health-giving localities of our much favoured isle. We speak of Bournemouth. We know few sea-side watering-places which possess so many features that recommend it. Scarcely twenty years old, it has established for itself, by its salubrity and beneficial influence in various forms of exhausting and degener-

ative diseases, a high reputation. But it has arrived at a period of its existence—its period of puberty—in which a great change must be effected for better or for worse. The dimensions which it has assumed, and the evident tendency which it exhibits to further growth, have compelled its inhabitants to think seriously about the drainage.

A large and influential party among the residents seeing, like wise men, into the future, and not adopting the *après nous le déluge* egotism of some contemporaries, wish to determine and establish a system of sewerage which, while abolishing all cesspools, shall not contaminate the beach and the sea in the vicinity of the town, and shall not require to be recast and remodelled after the lapse of a few years. They desire to adopt a plan approved by and carried out under the superintendence of an eminent sanitary engineer, which shall at once be capable of adaptation to the increasing wants of a necessarily increasing population, and at the same time benefit the surrounding country by a proper distribution of the fertilising contents of their sewers.

We see by the local papers that much discussion has been going on of late on the subject; but we rejoice also to see that a sanitary committee has been recently appointed, embracing the names of Drs. Burslem and Falls and Colonel Moody. The former two well known physicians secure an adequate representation of the medical aspects of the question; while the Colonel, who is an officer of the Royal Engineers, and has had large experience in drainage in the colonies, will advise on technical details. These gentlemen have received and published urgent letters from Mr. Edwin Chadwick, C.B., Sir Jas. Clark, Dr. Ferguson, Dr. Sieveking, and Dr. West, on the importance of a thorough and efficient system of drainage, which have been read before the local Board of Improvement Commissioners, with whom the above named Sanitary Committee are somewhat at variance as to the best mode of draining the town. We do not wish to constitute ourselves judges as to the merits of the points at issue between them; but we cannot but express a strong hope that the most enlightened counsels may prevail, and that such a system may be adopted as will save Bournemouth from the disgrace of having neglected the painful experience of the past, the teachings of science, and its own best interests, whether regarded in a moral, sanitary, or pecuniary point of view. Let those who may be disposed to sacrifice permanent advantage to temporary economy, reflect that an opportunity such as now offers will never recur, of rendering Bournemouth an illustration of the superiority of local to central government, of making it permanently one of the healthiest and most attractive of our watering-places, and of demonstrating the capability of even a very young community to anticipate the wants of its posterity.

HOSPITAL HYGIENICS.

For some time past, the Surgical Society of Paris has been seriously engaged in discussing the hygienic conditions of hospitals. The discussion has arisen *à propos* of the rebuilding of the Hôtel-Dieu, but is, of course, of general significance. The leading surgical authorities in Paris have taken part in the debates; and the whole question has been worked out in that complete and logical and precise method of argument characteristic of our French *confrères*. After two months' inquiry, the Society has adopted the following conclusions, its desire being to "contribute to the efforts now being made to withdraw the practice of surgery from the baneful influences of nosocomial complications, etc."

Every hospital should be situated in an open space, on sloping and spacious grounds. A minimum of fifty square *mètres* should be the smallest space allotted to each patient. The atmosphere of a hospital is purer in proportion as the hospital is removed from populous quarters. Only such hospitals as are absolutely required for cases of urgency and for instruction should be permitted in large towns—(a statement which we recommend to the consideration of the governors of St. Thomas's Hospital). Economy would be promoted by attention to this recommendation.

Good hygienic conditions may be readily obtained in hospitals of 200 to 250 beds. In large towns, where the beds exceed that number, such conditions are impossible. The expenses of hospitals of the size indicated are not greater (in proportion) than they are in much larger hospitals.

Atmospheric elements are mingled chiefly in a horizontal direction; consequently, the effects of contiguity of patients, of bed to bed, of ward to ward, and building to building, should be counteracted by the occupation of large spaces of ground.

Contagious influences are effectually opposed, not alone by augmenting the cubic space allotted to each patient, but above all, and especially, by increasing the superficial area, so sadly insufficient in our present civil hospitals. For this reason, the building should have few stories, because each story engenders its own vitiated layer of air. A rigorous hygiene would require that no hospital should consist of more than two stories.

It is an error to believe that an abundant aëration within the walls may be substituted in the place of space and external aëration. No artificial means will supplement the deficiency of natural aëration.

Buildings, completely isolated, having the same aspect, directly exposed to the rays of the sun, to the action of rain and wind, should be disposed in parallel lines of 80 or 100 *mètres* apart, in order to obtain an effective degree of isolation and free and ready external aëration.

Small wards, containing from fifteen to twenty beds, are superintended with facility. In such wards, the patients are less exposed to mutual inconveniences occasioned by their diseases; the chance of direct contagion is diminished; and all impurities are readily removed. Wards of this size should be preferred for ordinary purposes.

The furniture should in no way interfere with the circulation of the air. The medical attendants should have power to remove the curtains of the beds in all cases where they think it proper.

The wards should be separated from each other by passages, etc.; and it is desirable that there should always be one to which the patients who can leave their beds may resort and take their meals.

The periodical and regular evacuation of the wards for an interval of some months produces results in French military and foreign hospitals, such as warrant the general adoption of the practice, especially in times of epidemics.

Everything should be disposed for facilitating the rapid removal and destruction of all odorous and infecting matters, which should never be allowed to remain either within or in the neighbourhood of the wards occupied by the patients.

The Surgical Society concludes by saying that, enlightened by the long discussion in which so many of its members have taken a part, it would be sorry to see the administration, in the project adopted for the reconstruction of the Hôtel-Dieu, neglect or overlook any of the principles here laid down. In its opinion, neither the wants of the population nor the requirements of instruction demand the erection of a hospital of six hundred beds in the *Cité* at the present day. Such a hospital must necessarily be subjected to evil hygienic conditions, both in respect of position, of space, of number of beds, of disposition of its buildings, and of aëration. The Society hopes that authority will listen to its advice, and adopt such a project as will be in conformity with the fundamental requirements of hospital hygiene. To this excellent wish of the Surgical Society of Paris we shall all affirmatively respond.

Naturally, in reading the complete and excellent debates, or rather we may call them finished discourses, on hospital hygiene (mainly addressed to the erection of another Hôtel-Dieu), which have been delivered by the leading surgical authorities of France during the last two months, our thoughts have again and again turned to the erection of St. Thomas's Hospital in our own metropolis. It is, we suppose, quite useless now to question further the propriety of again erecting so large a building on the site chosen for it, or any where within the air of the metropolis. This only we can say, that the very arguments and conclusions so urgently pressed upon the French Administration by the Surgical Society of Paris against the project of reconstructing and

erecting another large Hôtel-Dieu, tell with equal force and equal reason against the project of erecting a hospital of 400 or 500 beds on the Stangate site. The thing, we suppose, must now inevitably be done; but we must nevertheless be permitted to say that it is an act not in accordance with the laws of hygiene, as thus worked out by the Parisian Surgical Society; and that the words applied by the Society to the Hôtel-Dieu project seem to fit equally well the St. Thomas's Hospital project; viz., that "neither the wants of the population nor the requirements of instruction at the present day call for the erection of a hospital of 600 beds within the city. Such a hospital will be subjected to evil conditions both in respect of space, of number of beds, of disposition of its buildings, and of aëration of the whole edifice."

THE SMYLY TESTIMONIAL.

At the inauguration of the Smyly Testimonial, the public were favoured with a professional and a non-professional opinion of special hospitals by Dr. Stokes and Lord Wodehouse. The Smyly Ward for children in the Meath Hospital was opened on January 5th. The ward is a memorial erected to the memory of the late Surgeon Smyly, who had been thirty years connected with the Meath Hospital. The sum of £650 has been subscribed; and provision has been made for the support of nine out of the ten beds which the ward contains. At the head of each little bed is printed the name of the lady who has undertaken to support it, either from her own resources or money collected among her friends.

Dr. Stokes, having borne testimony to the merits of his departed friend, referred to the alarming prevalence of infant mortality in different countries.

"From a pamphlet by Dr. Moore, *On the Value of Hospitals for Sick Children*, we learn that the mortality of children in London, up to the tenth year of age, is about 35 per cent. In Manchester, the mortality before five years of age is 55 per cent. In Berlin, on an average of forty years ending in 1822, 52 per cent. died in the first year of existence; and during the war in the early part of the present century we have the authority of Casper for stating that not less than 71 per cent. perished. Mr. Simon well observes that a high local infantile mortality must indicate a high local prevalence of those causes which determine a degeneration of race. Without impugning the value of children's hospitals, it may be asked whether special hospitals for the diseases of children are to be preferred to the allocation of wards for a similar purpose in a great general hospital. This is one of those questions which must be solved by experience. In the meantime, I may be permitted to express an opinion that of the two plans the latter is the preferable one. The powers of the human mind become narrowed whenever they are long confined to any one specialty. Great physicians and great surgeons are only made by practice in a general hospital. In an hospital exclusively devoted to infantile disease, it is not likely that its inmates could ever have the advantage of such judgment and

skill as that possessed by a Cooper, a Brodie, or a Baillie, or by a Crampton, a Cheyne, or a Graves. It is plain, at all events, that the establishment of a children's ward or wards is a matter greatly to be desired in every large hospital. The success of the children's ward in the Adelaide Hospital may be appealed to. The Smyly Memorial Ward will be the second of these institutions; and I happen to know that it is the intention of the community of the Sisters of Mercy to allocate a portion of the hospital of the Mater Misericordiae for the same important purposes."

The Lord-Lieutenant dissented from the remark of Dr. Stokes, that great infant mortality in any population is a sure sign of its degeneracy. In Russia, there is a large proportion of deaths among infants; but the adult population are not the less vigorous on that account. Indeed, the fact that the sickly, weakly, and ill-formed children died naturally led to the inference, that the portion that survived would be more robust and vigorous than the whole population would have been if all the infants had lived. On another point, also, the Lord-Lieutenant expressed dissent. He said:

"Dr. Stokes has expressed a strong opinion in favour of attaching special wards to general hospitals rather than establishing a separate hospital for the special treatment of sick children; and I think it is very fortunate that in Dublin that system can be fairly and completely tried. At the same time, there are two sides to that question. It cannot be doubted—and I think the observation must be as applicable to medical science as it is to all other branches of science—that those who devote themselves to special departments do acquire a special and particular knowledge that is not possessed by others who travel over a wider field. Yet we must not allow ourselves to be entirely convinced that it may not be desirable for many classes of disease, at all events, to have special hospitals established, provided you have them on a sufficiently large scale; for, undoubtedly, if they were not on a large scale, the experience of the medical officers will be too much contracted. I believe that, where you have these special hospitals on a large scale, you will advance medical science more effectually than by having professional duties extended over too large a field. I think that all who have attended to the progress we have made in the various sciences and arts must have perceived that those who have devoted themselves to some one special pursuit are generally those who have made new discoveries and inventions for the benefit of mankind."

BANTINGISM ABROAD.

MR. BANTING may well be elated at the success of his system; for, besides having been put on the stage in London, it has now found an exponent in Germany, in the person of Professor Julius Vogel of Halle. The force of circumstances, and the idiosyncracies of the medical students of Halle, have removed Professor Vogel from the Clinical Professorship which he held in that University, and caused him to return to the sobrieties of Morbid Anatomy, the subject by which he made the reputation which carried him to the clinical chair. He now employs

some of his leisure time with the vindication of great principles to their authors, and his *Essay on Corpulency* is one of these vindications.

The principles and practice of Bantingism are, in his pamphlet, clearly shown to be nothing more or less than the application of the well known chemico-physiological discoveries of Liebig to the construction of a very commonplace dietary; and, consequently, to be neither new nor original. At the same time, the author makes use of the humorous element in Mr. Banting's tale, which is of course the mainspring of its popularity, to impart this latter quality to his essay, so as to make it acceptable to that peculiar class of beings, the lay readers of medical essays written with a keen eye to the main chance.

In a notice of his essay, which Professor Vogel has published in a periodical, we perceive that he lays stress upon the statement made by Mr. Banting, to the effect that he had consulted several of the foremost physicians of London to get relief from his corpulency, but without success. What a pity it is, that Mr. Banting did not publish the advice and prescriptions which were thus given to him in vain! And withal he might add the names of those gentlemen who advised him; for, as they belong to the most eminent, the failure of their skill in his case can do them no great harm. Perhaps, also, this plan would provoke a little cross-examination by way of retaliation, with a view of showing whether or not Mr. Banting followed to the letter the advice given by these eminent physicians. As matters stand at present, there exists necessarily a little prejudice against this statement regarding the failure of the advice of these eminent doctors of the healing art. This prejudice is founded upon the peculiar circumstance, that the art of reducing corpulency by dietetic means derives from Æsculapius himself, and was practised by his sons and successors; and Hippocrates even went so far as to commit the indiscretion of recording the Æsculapian rules in his aphorisms.

"Fat people" (he says) "who wish to become slender, must do their work with an empty stomach, take their food while panting with fatigue, and not allow themselves to cool down; they should then drink a little somewhat diluted wine, and eat green vegetables. The vegetables should be dressed with a great deal of grease, in order that the smallest possible quantity may do away with the appetite. They must eat but once in the day, remain unwashed, sleep upon a hard bed, and walk about naked as much as possible."

Here is a code of rules which, we warrant, would reduce a man of twice Mr. Banting's dimensions and weight to the size of an ordinary mortal in a reasonable time. The rules are quite in harmony with physiological science. All trainers know them well, and have always known and practised them; the walking about naked included. This latter part

would be difficult of execution in St. James's, except, perhaps, between the hours of three and five in the morning. But, in rural retirement, it offers no difficulty; and at the seaside, it would merely amount to the prolongation of a fashionable amusement. As for that ounce of sugar which has such enplastic properties as to increase the weight of an alderman by somewhat like ten times its amount, it has betrayed, in an objectionable manner, the amount of logic which gentlemen who now talk about the subject of fat are really able to apply to it. To our readers we beg to propose a problem, the solution of which, we are sure, would enlist much more sympathy amongst society than Bantingism; namely, rules by which the cacoplastic constitution can be made to deposit adipose matters—regulations by which a scraggy young lady can be made fat. The solution of this problem would command the attention and recognisance of vast numbers of the sweetest and most sugar-devoted human beings.

DR. GAIRDNER, in the *Glasgow Medical Journal*, details his experiences of "Two Months of Fever Duty in the Glasgow Royal Infirmary." His conclusions are worthy of very serious attention.

Dr. Gairdner regards typhus as a disease which has a distinct and certain course to run, and cannot be cut short. Two-thirds or three-fourths of his cases were successfully treated "without either medicine or stimulants." Febrile excitement, rapid weak pulse, and delirium, are normal facts of the disease, and cannot be avoided or cut short. Remedies, therefore, are to be reserved for variations from this normal course of things; as when tartar emetic is given in bronchitic complications, and stimulants in tendency to collapse. Under such practice, mortality has not been more than 9.3 per cent. In persons up to the age of 20 or 15, fever, so treated, is of hardly any danger. Nourishment of the kinds indicated is to be carefully administered throughout the course of the fever; viz., a bland and nutritious diet, as milk, buttermilk, rice, arrowroot, and beef-tea. Free ventilation is indispensable. "Good nursing and constant watchfulness, especially watching the chest, evacuations, and the skin of the back, are the real 'physic' needed by all fever patients." No alcoholic stimulants, or only very small and carefully regulated quantities, need be added to the diet. "The first lesson that has to be learned in dealing with fever, is at the same time to many minds the most difficult—to let well alone. The argument, to many an irresistible one, will always recur, What! are we to stand by and do nothing at all, when the pulse is 120, the tongue dry, the brain oppressed and delirious? The question is an extremely embarrassing one. But, in view of facts which have become clearer and clearer in proportion as our knowledge of typhus fever has been defined and rendered more exact, it has become a duty with teachers of medicine, not indeed to acquiesce in a blind expectancy, any more than in any other unreasoning routine, but to take a firm hold of principles based upon experience, and to place these in the light of such practical illustrations as their opportunities, derived from hospital practice, enable them to command."

Progress of Medical Science.

SURGERY.

SUBAPONEUROTIC LIPOMA OF THE THIGH. Many cases are on record in which large lipomata have been removed; but in almost all instances the tumours have been subcutaneous. Deeply seated lipoma, under the aponeurosis and among the muscles, are more rare, and there are but few instances of extirpation of them. M. Velpeau some years ago removed an adipose mass weighing 16 kilogrammes (about 35 pounds) from the inner and upper region of a man's thigh. In 1854, M. Robert shewed to the Surgical Society a lipoma removed from the temporozygomatic region. In 1856, M. Marjolin removed a large lipoma from among the muscles of the posterior part of the thigh of a young child. Gerdy removed deeply seated lipomata from the fore-arm and thigh. In 1864, M. Ollier removed from a woman, aged 35, a lipomatous tumour situated under the trapezius. M. Cruveilhier, in his *Anatomie Pathologique*, says, that he knows of no instance of intermuscular fatty tumour in which the mass was so large as in M. Velpeau's case. In November 1863, a lady, aged about 40, perceived a painless enlargement of her thigh, which increased rapidly. In May 1864, she placed herself under the care of M. Ollier, who found a tumour of the upper and inner part of the thigh, covered by the fascia. It was found to be unattached to the bone. It was removed by operation, a considerable amount of dissection among the muscles being found necessary. The only point where there was adhesion of any strength was at the ramus of the ischium and pubes; and in removing it, a small portion of bone was detached. The tumour weighed six kilogrammes (more than 13 pounds avoirdupois). The patient recovered completely, without any unfavourable symptoms. (*Gaz. Méd. de Lyon*, 16 Novembre, 1864.)

TRAUMATIC ANEURISM OF THE OPHTHALMIC ARTERY; LIGATURE OF THE COMMON AND EXTERNAL CAROTIDS. The following case has been related to the Academy of Medicine by M. Legouest. The patient had traumatic aneurism of the orbit, which had appeared after a fall from a height, and was accompanied by exophthalmia and paralysis of the sixth nerve. Digital compression was applied to the trunk of the common carotid for four days without success. M. Legouest then determined on first tying the common carotid artery, then the external carotid above the origin of the superior thyroid. The characteristic signs of the aneurism disappeared; the tumour gradually diminished; the eye returned into the orbit; the sight was preserved, but permanent strabismus remained, doubtless from an irremediable injury of the oculo-motor nerve. (*Bull. Génér. de Thé.*, 15 Novembre, 1864.)

MERCURIALISED COLLODION AS AN APPLICATION TO CONDYLOMATA. A patient aged 56, under the care of Dr. G. Finco of Padua, had around the anus a large number of condylomata, which had increased in size under the use of nitrate of silver. Dr. Finco mixed twenty-five centigrammes of corrosive sublimate with fifty-two grammes of collodion, and, having shaken the mixture well, applied it with a brush over the two largest tumours. The next day, these had almost disappeared. In the course of sixteen days, Dr. Finco destroyed more than sixty condylomata; and the patient had no return of his disease. (*Gaz. Med. Ital. Lomb.*; and *Bull. Génér. de Thé.*, 30th Dec. 1864.)

OBSTINATE HÆMORRHAGE FROM A TOOTH: COMPRESSION OF THE COMMON CAROTID ARTERY. A lady aged 78, had for some days a painful enlargement of the gum on the left side of the upper jaw, near the last molar tooth, of which only the old carious fangs remained. One day, she observed a discharge of blood from the painful part. This increased to a somewhat alarming extent, and plugs dipped in perchloride of iron were applied, and syrup of the perchloride with syrup of digitalis was given internally. The hæmorrhage still, however, persisted, and the patient became seriously weakened. Thereupon M. Guipon, under whose care the patient was, compressed, by the fingers, the common carotid artery against the cervical vertebræ. The hæmorrhage was sensibly diminished in less than half an hour, and was completely arrested in an hour. Pressure was maintained steadily during some time longer; no return of the bleeding took place, and the patient recovered gradually from its effects and from those of the application of the perchloride of iron to the mouth. (*Bull. Médicale du Nord*; and *Bull. Génér. de Thé.*, Dec. 30, 1864.)

EXOSTOSIS OF THE NASAL FOSSA. A patient, under the care of M. Legouest, had a large ivory exostosis in the left nasal fossa. It had distorted the face in the same way as a large fibrous polypus, and gave rise to dangerous hæmorrhage. It was impossible to ascertain its extent and attachments; and, to remove it M. Legouest, having made the necessary incisions through the soft parts, enlarged the anterior nasal aperture with the gouge and mallet, and, still finding it impossible to displace the tumour, temporarily removed the vault of the palate, after which the tumour, which projected from the posterior nares, was enucleated. The bones were replaced; the soft parts were united by suture; and the patient recovered, preserving nearly entire the osseous portion of his face. (*Bull. Génér. de Thé.*, 15 Novembre, 1864.)

ENCYSTED TUMOURS IN CHILDREN. Encysted tumours are often met with on the face and scalp, and especially the eyelids; and although they may sometimes disappear under the influence of an inflammatory elimination or the action of solvents, when they prove persistent and increase in size they should be removed. In dread of erysipelas, M. Guersant has renounced in these cases the employment of cutting instruments and resorts in all of them, even in tumours of the eyelids (except when these can be extracted on the inner side), to the Vienna paste. Through the aperture formed by its aid the tumour will sometimes issue unaided, although, on other occasions, its elimination may have to be assisted. The cicatrix left behind is smooth and does not project, but it is of slower formation than is that which succeeds to incision. No accidents follow the separation of the tumour, especially when its extrusion has taken place unaided. Sometimes, when this process has been sought to be hastened, erysipelas has occurred. The tumour to be acted upon is covered with adhesive plaster, in which an aperture has been cut of the form and size of the intended opening in the skin, and over this the paste is spread. In eight or ten minutes an eschar is produced, which may be poulticed or otherwise treated, so as to facilitate its separation. This may be delayed for eight or ten days; and after it has taken place, and the tumour has issued out, whether spontaneously or aided by nitrate of silver, cicatrization should be encouraged. With respect to small cysts of the eyelids, M. Guersant follows Dupuytren's procedure of opening and emptying them, and then cauterising their internal surfaces. (*Bull. Génér. de Thé.*, and *Dub. Med. Press.*)

HARVEIAN SOCIETY OF LONDON.

THURSDAY, DECEMBER 15TH, 1864.

W. ADAMS, Esq., F.R.C.S., President, in the Chair.

A Case showing the Dangerous Effects of Mercury through the Skin. By W. SEDGWICK, Esq. A journeyman tailor, aged 23, in consequence of what appeared to be a venereal sore, with some brown patches on the skin, had applied on October 31st for advice at one of the large hospitals as an out-patient. He received a pot of blue ointment, which he was desired to rub into the thighs night and morning; and a small bottle of colourless lotion for the sore. After using the ointment a few times, the gums became very swollen and raw, and the patient felt very ill and exhausted; but he managed to attend again at the hospital on November 4th, when he was told to continue the ointment and lotion, and to attend again next week. The symptoms of exhaustion, however, increased so rapidly, and the salivation became so profuse, that the patient's friends were much alarmed, and requested Mr. Sedgwick to take charge of the case. Mr. Sedgwick visited the patient for the first time on November 6th, and found him suffering from profuse hæmorrhage from the mouth, which appeared to proceed from the mucous membrane of the gums and cheeks; but it was almost impossible at the time to examine the interior of the mouth, as the jaws were fixed. The mercurial fœtor was very offensive and overpowering, and the patient had not had any sleep during the two previous nights. A gargle, composed of a solution of chloride of sodium with hydrochloric acid and syrup, was used with advantage; and the patient was ordered to take every four hours a mixture of quinine and ether. Brandy and milk were given at short intervals, and as much beef-tea as he could manage to swallow. There was considerable hæmorrhage from the mouth for three days afterwards; and this did not entirely cease until November 13th. The gargle for the mouth completely did away, after a few days, with the mercurial fœtor; and, by means of twelve-grain doses of Dover's powder at night, some amount of interrupted sleep was obtained. As soon as the patient's mouth could be opened fully enough to allow of examination, it was ascertained that not only were the gums very much swollen and ulcerated, but that the adjacent mucous membrane of the cheeks and sides of the tongue, as far back as it was possible to see towards the base, were also extensively ulcerated. The patient recovered, so as to be able to take out-door exercise for the first time on November 25th; and, at the time of last report (December 1st), was quickly recovering his strength. With reference to any supposed necessity for mercurial treatment in this case, it was stated that the patient had been married two years and a half, and had not apparently required any medical advice since his marriage. He had led a "gay" life, and had been treated for venereal disease; but this, it was said, had been cured.

Mr. DE MÉRIC observed, that the danger of mercury through the skin was like that of using it in other ways. Some persons would take four or five times as much as others to salivate them. In cases of salivation and ulceration of the mouth caused by mercury, he had found a useful application to be a stick dipped in pure hydrochloric acid and applied to the ulcerated surfaces, which then should be gargled with a solution of salt in water.

Dr. DRYSDALE remarked, that medical literature teemed with accounts of injury inflicted by the use of mercury as an ointment rubbed into the blood. Dr. Christison had mentioned a case where two drachms of blue ointment rubbed in on the thighs had produced pytalism and death in three days. Dipping the hands in mercury for a few hours has produced salivation. Ramazzini and Tardieu had given a sad picture of the workmen employed in mines of mercury. Trembling paralysis, swelling of the feet, ulcers of the gums, loss of the teeth, asthma, phthisis, were among the diseases ascribed to this dangerous poison. In describing the mines of Frigas and Almaden, most authors attributed to mercury the accidents which are sometimes met with in the mercurial treatment of syphilis; viz., salivation, vertigo, loss of memory, trembling, partial paralysis, and pains in the bones. Workmen of thirty years of age are quite edentulous. Of 3,911 workmen at Almaden mines, forty-eight sicken yearly; the half of these patients die in the course of a year. As it had been fully proved, he thought, by the evidence adduced by himself and others, that diseases were injured instead of benefited, including syphilis, by the use of mercury, it was high time that its internal use should be abandoned. He had recently received the works of Professor Böck of Christiania, where every case of syphilitic ulcer and its treatment had been kept since 1827, and where mercury is now definitively abandoned; in consequence of which, bone-disease is no longer met with in those treated in Norway.

On the Syphilitic Affections of the Nails. By V. DE MÉRIC, Esq. The author recapitulated the subjects he had treated on former occasions before the Society; one being the possible escape of children born of syphilitic parents; the other, hard chancre in the female. As to the affections of the nails, he considered them very rare in syphilis; as, in a practice of twenty years, he had seen but a few cases. He divided these into two classes—the purulent (onychia syphilitica), and the dry (ungual psoriasis). Of the first class, Mr. De Méric related several cases both from private and public practice, those occurring in hospital being accompanied by drawings. The dry class, characterised by yellowish stains under the nail, and the gradual brittleness and crumbling of the latter, was illustrated from private practice chiefly; one case being very remarkable by presenting the affection in two individuals, one of whom had been contaminated by the other. The author had brought forward the subject principally to aid diagnosis, and to attempt the description of the characters which are peculiar to syphilitic affections of the nails, seeing that these characters are not sufficiently noticed in systematic works.

The PRESIDENT asked whether there was not, in addition to the two forms of nail-disease so well described by the author, another class of cases, where the nail begins to dry and split up the middle, and spots may be seen in the nail by making a thin section of it and viewing it in the microscope. A lady, in good health, had almost lost the nails of three fingers of both hands by such a disease. All the specifics in the *Pharmacopœia* had been tried on her to no purpose.

Mr. JAKIN related a case of syphilitic onychia, occurring in a painter and plumber, which was cured by the use of the nitrate oxide of mercury ointment.

Dr. MORTON mentioned a case of syphilitic disease of the nails recently seen by him.

Dr. DRYSDALE had seen a case similar to that mentioned by the President in a person with lepra of a simple kind.

Mr. CURGENVEN mentioned that splitting of nails seemed to be a constitutional peculiarity, as he had had a family under his care where this affection was found both in parents and children.

Dr. Sisson said the diagnostic signs of syphilis were very uncertain: mistakes in this respect were daily made by the best observers. With regard to the copper colour of an eruption, it must be borne in mind that this only occurred in the later stages; and that at such stages it was not confined to syphilis, and was only valuable when taken with other symptoms. He had always considered the absence of itching a valuable diagnostic mark in syphilitic eruptions; but it was fallible, as he had at present a patient with syphilitic lichen under his care, who complained of intense itching.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

TUESDAY, DECEMBER 13TH, 1864.

R. PARTRIDGE, Esq., F.R.S., President, in the Chair.

THE CAUSES AND PREVENTION OF INFANT MORTALITY. BY ISAAC PIDDUCK, M.D.

THE design of this paper was to designate the causes of excessive infant mortality with a view to its prevention.

These causes might be regarded in a twofold aspect—the hygienic and the medical. Under the former were comprised all that related to the health of infants; under the latter, everything that pertained to the health of the parents. It was to the last two points that the attention of the Society was more especially invited. Statistics have revealed the appalling fact that more than one-half the children born die within five years of their birth. But this only comprised children born at the full term; it did not include miscarriages, still-born infants, and those who died immediately after birth; and not to mention numerous cases of infanticide, whose deaths were not registered. The preventible causes producing this alarming result were comprised under the following heads:—1. Sexual excesses. 2. Syphilitic diseases. 3. Excessive indulgence in tobacco-smoking, snuff-taking, and chewing, and of spirit-drinking. 4. Unhealthy occupations, such as mining and metallurgic operations. These principally pertained to the fathers; those which more especially belonged to mothers were:—1. Indulgence in idle, luxurious habits. 2. Sedentary occupations, factory and agricultural labour. 3. Deficient nutriment, the want of which is too often supplied by excessive tea-drinking, if not by stimulants of a more pernicious kind. 4. Mental distress arising from domestic troubles and from the loss of children. And lastly, as a consequence, debility occasioned by hæmorrhagic and leucorrhœal uterine and vaginal discharges, especially during utero-gestation.

It was by the combined operation of these causes that the health and vigour of the parents were undermined, which tended to the production of a puny, non-viable offspring.

A brief statement of a few out of the many cases presented at the Bloomsbury Dispensary followed, in which one child after another, in some as many as

five out of six, in others all the children, died in infancy. In all these cases the cause was clearly traceable to the habits and health of the parents, and for the most part was preventable.

The action of the remote causes gives rise to *tuberculosis*. The symptoms of tuberculosis, being a blood disease, may be manifested in all the tissues of which the body is composed; in short, there is scarcely a disease which is fatal in infancy and childhood that may not be referred to some form of tuberculosis, and that this is in the great majority of instances congenital, *post mortem* investigations of infants clearly demonstrate. In the temperance movement it was long before people could be made to believe that intemperance is destructive of health and the real enjoyment of life; but by reiterated statements of facts and reasoning upon them a deep impression has been made, and habits of intemperance amongst respectable classes have been considerably diminished. So in this case, by a repetition of the causes producing such excessive infantile mortality an impression may be made upon the minds of parents favourable to the health and longevity of their offspring. To this end would be conducive early marriages, the marriage of our sailors and soldiers, extending to children the motives for temperance in parent and newly-married couples; the duty of capitalists to promote the health of their labourers by every means in their power; and lastly, subjecting mothers, who are suffering under exhausting discharges during utero-gestation, to a course of treatment directed to their cure.

ULCER OF THE LOWER PORTION OF THE ILEUM, COMMUNICATING WITH THE BLADDER.

BY JOHN MORGAN, ESQ.

A gentleman, aged 60, having been much in tropical climates, but without having had severe dysentery, in March 1862, first complained of a fulness in the left groin, which, though undefined for some weeks, increased in the following six months to a considerable size. It was attached posteriorly, painful on handling, and seemed to interfere with the functions of the bowels, which, from having been generally relaxed, became unusually torpid. In April 1863, he began to pass feces by the urethra, at first slight in quantity, but soon the whole intestinal contents were discharged through this channel. Under the pain and irritation thereby produced, the health soon gave way, and he died six months after the first appearance of feces in the urine.

A *post mortem* examination showed that the tumour had quite disappeared. On opening the abdomen the ileum was found dilated into a large pouch, for an extent of five or six inches, when within a short distance of its junction with the colon. The coats of the intestine were attached firmly to the inner wall of the abdomen and also to the bladder, and an ulcer, the size of a sixpence, was found opening directly into the bladder, at the fundus of this organ. No other spot of ulceration was observed in any other portion of the intestine.

LINCOLN MEDICAL SOCIETY.

THURSDAY, JANUARY 5TH, 1865.

E. F. BROADBENT, President, in the Chair.

Cancer of the Penis. Mr. SYMPSON made some observations on a case of cancer of the penis, in which he removed the organ close to the pubes.

Small-pox and Vaccination. Mr. GARNHAM observed that the city of Lincoln had during the past year been visited by an epidemic of small-pox; and, in his office as house-surgeon to the General Dis-

pensary, he had been called upon to attend a large number of the cases. On referring to the annual statements of the institution, he found that, in the eight successive years 1853-60, only nine cases were recorded, and no death; in 1861, 50 cases, and one death; in 1862, 32 cases, and no death; in 1863, 36 cases, and one death; in 1864, 150 cases occurred, and eight proved fatal; and these, with the exception of two cases, in the last two quarters of the year. Mr. Garnham observed that some cause must be assigned for this steadily increasing tendency year by year to an epidemic of this disease; and he considered it to be due to the manner in which the compulsory Vaccination Act was carried out, many parents in the town refusing to have their children vaccinated. Of the 98 cases, the papers of which had been returned to him, he found as follows: Not vaccinated, 29; said to be vaccinated, did not take, but having no cicatrix, 18; having one cicatrix, 26; having two cicatrices, 21; having three cicatrices, 4. Of the eight fatal cases to which he had certified, all were unvaccinated, except one, which was said to be done, but bore no cicatrix. Of 47 vaccinated persons attended with modified small-pox, 41 were above the age of ten years. He considered the Vaccination Bill as good in its working as the Medical Registration Bill, being left to the public to carry it out; consequently, being every man's duty, it never got done. The subject of vaccination was fully discussed, several members affirming they had never seen a case of small-pox within seven years of successful vaccination.

Microscopic and Pathological Preparations were exhibited; and the members were afterwards entertained by the President.

Correspondence.

PRICEY v. BOWEN.

LETTER FROM EDWARD LUND, ESQ.

SIR,—In accordance with the promise I made in my letter to you of Saturday last, I beg to state that, in my written opinion on this case, after having described the condition of the plaintiff's arm, in which I said: "She has no power whatever to turn the hand round so as to change the position of the palm or the back of the hand, although it is possible for another person to move it slightly in either of those directions, which gives her some pain; the hand, as it is at present, is quite crippled and useless to her"; and, after explaining that there were two bones in the forearm, one of which crosses the other in the act of turning the hand, etc., I went on to say: "Now, there is naturally a space between these two bones, nearly three-quarters of an inch in width in the widest part, when the bones lie side by side parallel to each other; that is, when the palm of the hand is uppermost, there is the greatest space between the two bones; but when the back of the hand is uppermost, the radius has been so brought across the 'ulna' that the two bones almost touch each other in the middle part of the forearm. To keep the hand for a long time laid on its back (or *supine*) is a very irksome and painful position; or else, being that in which the two bones are furthest apart, it would be the best position in which to place a forearm so as to prevent the bones growing or sticking together improperly; and, therefore, it is customary in such an accident to keep the hand in what is called the *semi-prone position*, half way between the two extremes—that is, with the thumb uppermost and the fingers forward.

"Now it appears, according to the statement of the plaintiff, that the defendant caused the hand to remain in the *prone position* for the first nine days after the accident, which would keep the broken portion of the radius so near to the broken portion of the ulna that, in my opinion, the bones would be liable to stick, or grow together, to a certain degree; and that this is one chief cause of the plaintiff not being able to turn the hand, or to roll the radius over the ulna, as takes place in that movement. Moreover, when the hand is prone (*back upwards*), the nerves and blood-vessels are more compressed and displaced than in any other position; and this, therefore, would greatly increase the tendency to sloughing, which came on towards the end of the nine days.

"I do not think much can be said against the defendant for having over-banded the arm in the first instance. It clearly was not intentional; he saw the patient in about twenty-four hours afterwards, and from the sudden swelling of the forearm, the bandage might appear to be too tight *then*, while, perhaps, when first put on, it was not at all so. Still the limb was not in the most favourable position for the circulation of the blood; and the position of the hand was such as to make it much more likely that it would swell, than if it had been laid on its back, or placed edgeways with the thumb uppermost.

"If the case go into court, I am of opinion that it is very important Mr. Martin, who saw the plaintiff, should appear to bear testimony to the state in which the forearm and hand were, at the end of the six weeks, when the plaintiff was removed from the treatment of the defendant. The defendant will doubtless say, that he cannot be held responsible for the results of an injury which has been under surgical treatment for nearly fifty-two weeks, when he had only to do with it during six weeks of that time; therefore, it is not so much how the limb is at the present time, but how it was when the defendant ceased to treat it, and if its bad state at that time was due to his fault, and has clearly brought about its present crippled condition.

"Fractures of the forearm are admitted by all surgeons, and in all surgical works, as being very difficult to treat; and they are sometimes, even with the greatest care, followed by serious deformity and loss of the use of the hand. Sloughing cannot always be prevented; and the *turning point* in this case will be, whether or not everything was done on the part of the defendant which ought to have been done to prevent this, and to preserve the mobility of the limb.

"Everything, therefore, will depend on the value of the plaintiff's own testimony as to the precise way in which the fractured arm was placed and treated during the first nine days; for, unless malpraxis can be fairly shown during that period, I believe the case for the plaintiff will break down."

I considered that, in thus expressing my opinion, I had given it as fairly as I could, as an expert ought to do, with reference both to the interest of the plaintiff and the defendant; and, seeing that I had narrowed the decision of the case for the plaintiff to the one single question of fact, whether or not the description of the treatment was true or false, it seemed to me that the defence would not be difficult, in the event, as was easily shown at the trial, of the defendant having acted in a perfectly correct manner according to the legitimate rules of surgery. I have also to state that I have received an authentic transcript of the short-hand writer's notes of the evidence given by me in this trial, from which I will make a few extracts, to show that some of the wording of the newspaper paragraphs gives an erroneous idea of the exact opinions which I expressed on that occasion.

But before doing so, being aware that exception has been taken, and as I think, on reflection, properly taken, to the answer given by me to question No. 2, viz.:—"I believe you are one of the surgeons of the Manchester Infirmary—the Royal Infirmary?" *Answer*—"I am,"—I will observe that, inasmuch as I am a dispensary surgeon and not a full surgeon to the Manchester Royal Infirmary, I am prepared to accept any blame that may attach itself to me, for having omitted to mention this distinctive difference.

In the *Liverpool Mercury*, it is stated, Mr. Lund deposed that "he had heard Mrs. Pryce's description of the way in which her arm was placed, and that, if that description were true, he was of opinion that it was improperly placed." "The proper position was with the palm uppermost; and it was known amongst medical men that the reverse position was wrong."

With regard to the latter part of this statement, what actually took place was this. Having answered the fourth question put to me, in which I was asked if I had heard Mrs. Pryce's description of the treatment said to have been adopted, I was requested by the counsel for the plaintiff to place the bones of an articulated forearm in such a way as that they would be nearest to each other (*prone*), and then I was asked the next question, viz.:—"Now, assuming it to be true that her arm was placed in the splint as she described, with the back of the hand up, is that the proper way of setting the arm?" *Answer*—"No."

I was next asked, in the same way, to place the bones so that they should be furthest apart (*supine*); and the question was put, "What would be the proper way of placing the arm?" I answered, "The best way of placing the arm would be thus, the forearm slightly bent with reference to the arm, and the palm uppermost," and I made this answer as the direct conclusion or inference from the position in which I had just placed the bones, so as to show them as the furthest apart; for in the next question I was asked, "Is that the regular and well-known way of placing the arm, in a simple fracture of the forearm?" and I immediately replied, holding my hand in the usual semi-prone position, "This is the best position in which to place it in a case of simple fracture." And it is worthy of remark that, in the manuscript copy of the shorthand writer's notes now before me, the transcriber has emphasised the word *this* by placing a line beneath it, as if it were to be printed in italics, to indicate, doubtless, that when I used the word, I threw great stress upon it, to show that it was the position in the treatment of a fractured forearm; I being led to show the supine position only in illustration of that condition in which, for anatomical reasons, the bones would be the furthest apart. Then followed these two questions, with the answers:—"Is the other way, with the back of the hand up, known among medical men to be a wrong way?" *Answer*—"Yes, it is a wrong way of placing it." "Would it be wrong practice to leave the arm in this position, with the back of the hand up, during nine days?" *Answer*—"It would be wrong practice, in my opinion."

The error, therefore, which has occurred in the newspaper description would lead those who have read the account to suppose that I said the *supine* position was the position, *par excellence*, whereas, as soon as I was asked to give "the regular and well-known way" of placing it, I showed the semi-prone position.

Another mistake which has arisen from the newspaper description being so freely circulated, has been, that it has appeared as if I had stated the bones were *absolutely* grown together, while this assertion was "denied by Mr. South" in his evidence; yet, in my written opinion, it will be seen that I said it was possible for another person to rotate the hand slightly,

although she could not do it herself; and when the following questions were put to me in the witness-box, the answers will show I did not state that the bones were completely united together, but that passive motion could still be permitted.

"Is there something which is not bone, which is between these two bones?" *Answer*—"Yes, a strong membrane called the interosseous membrane, between the bones." "If that becomes stiffened, it prevents them turning one over the other?" *Answer*—"Yes." "Is that the reason why the wrist will not rotate?" *Answer*—"Yes, why she cannot perform this motion (the witness describes by turning his hand round)." "Can she perform this motion?" *Answer*—"She can let it be done for her."

It has also been said, in the newspaper report from which your extracts were taken, I agreed with Mr. Evan Thomas, junr., that the bones were glued together, etc., as if I had stated that I had formed my opinion conjointly with his; whereas the remarks I made were given quite independently of what had been said by any other witness, and on my own responsibility; for, in the shorthand writer's notes of my evidence, there are no questions or answers in which reference is made, in any way, to that gentleman's name.

It has been asked, how is it that I did not apply to Dr. Bowen and hear his version of the case before the trial? My answer is, that it did not occur to me to do so; and, had I thought of it, I should have considered it improper, after giving an opinion on the merits of the case to the solicitor of the plaintiff, to have had any communication with the defendant.

I can only repeat how deeply I regret that I did not, in the first instance, decline to touch the case at all, or to give any opinion whatever about it; but I beg to assure yourself and the profession generally that, in my whole conduct in this matter, I have erred from a want of judgment, rather than from a desire to injure a member of my own profession.

I am, etc., EDWARD LUND.

Manchester, January 10th, 1865.

SIR,—I am instructed by the medical officers of this Infirmary to forward the enclosed correspondence, and to request the favour of your publishing the same.

I am, etc.,

BRANSTON NASH, *House Surgeon*.

The Royal Infirmary, Liverpool, Jan. 7th, 1865.

[COPY.]

Dear Sir,—Complying with the instructions of my colleagues, I beg to transmit to you the accompanying document.

I am, dear sir, your faithful servant,

J. VOSE.

To the Chairman of the Medical Board of the Manchester Royal Infirmary.

Liverpool Royal Infirmary, Dec. 24th, 1864.

At a meeting of the honorary physicians and surgeons of the Liverpool Royal Infirmary, held on Saturday, December 24th, 1864, it was resolved—"That the attention of the honorary medical officers of the Manchester Royal Infirmary be called to the cause *Pryce v. Bowen*, tried at the Liverpool Assizes, before Mr. Justice Blackburn, on Thursday last, the 22nd instant. From a perusal of the evidence given upon that occasion, it will be observed that a gentleman of education and of experience, who holds the office of surgeon to one of the hospitals in this district, had an action brought against him for alleged unskillful treatment of a broken arm. The plaintiff's solicitors, after vainly endeavouring to procure medical evidence against the defendant from the profession in Liverpool, turned their attention else-

where; and succeeded in obtaining the services of Mr. Lund, who declared himself, at the trial, to be a 'surgeon of the Manchester Royal Infirmary', and who gave evidence for the plaintiffs; which evidence, the medical officers of the Liverpool Royal Infirmary submit, was not to be expected from a member of the profession, who holds the appointment of surgeon to the Manchester Royal Infirmary. Signed, on behalf of the meeting, JAMES VOSE, M.D., Fellow of Royal College of Physicians, Chairman. P.S.—A copy of the *Liverpool Mercury*, containing an account of the trial, is herewith enclosed." To the Chairman of the Medical Board of the Manchester Royal Infirmary.

[COPY.]

Manchester Royal Infirmary and Dispensary, Jan. 5th, 1865.

Sir,—In reply to your communication of the 24th ult., to the Medical Committee of this hospital, I am directed to inform you that Mr. Lund is not a surgeon to the Manchester Royal Infirmary, but Mr. Lund is one of the dispensary surgeons; and, inasmuch as Mr. Lund is not a member of the Medical Committee, this Board must decline entering into the consideration of Mr. Lund's conduct in his capacity as a private surgeon.

I have the honour to be, sir, yours obediently,

GEO. REED, M.D., *Resident Medical Officer*.

To the Chairman of the Medical Committee, Royal Infirmary, Liverpool.

DR. BARCLAY ON MEDICAL ERRORS.

LETTER FROM GEORGE JOHNSON, M.D.

SIR,—I shall feel obliged by your publishing the enclosed letter, which I have addressed to Dr. Barclay.

I am, etc., GEORGE JOHNSON.

11, Savile Row, Jan. 9th, 1864.

[COPY.]

Dear Dr. Barclay,—I beg to thank you for the copy of your book on *Medical Errors*, which you have been so good as to send me.

On reading the work, however, I find that you have criticised me and my treatment of cholera by purgatives in a manner which I consider unjust, and of which, therefore, I feel that I have a right to complain.

The passages to which I chiefly object are the following. You say: "One or two remarkable recoveries took place after the administration of castor-oil; and it was consequently assumed that the action of the oil was directly curative by aiding in the elimination of the poison."

Again, you say: "The theory [of elimination] was very easily put to the test of experiment; and it seems to us now, on looking back, strange that the author should not have so tested it before venturing to bring it publicly forward. It seems probable that the theory was based on a false analogy, which associated under the common term 'poison' two conditions which are really quite dissimilar; and that the author applied to the one deductions drawn from the facts connected with the other. On this assumption, he rested mainly for the acceptance of his inferences. He does not seem to have attached much importance to the cases adduced, although he was aware that, without such supposed evidence of its having been tested, he could not have gained a hearing."

Now, I beg to remind you that, in my first published communication on the subject of cholera (*Medical Times and Gazette*, Sept. 1854), I stated that I had treated fifteen cases by castor-oil, and that twelve of these had resulted in recovery. The number of cases, I admit, is small; but the difference between twelve recoveries and "one or two" is con-

siderable. Then, in the same communication, I stated that a careful study of the subject had convinced me "that those plans of treatment which have been attended with the largest amount of success have been essentially eliminative in their tendency. I allude especially to the saline treatment of Dr. Stevens; the treatment by small and repeated doses of calomel, as practised by Dr. Ayre; and the emetic plan of treatment. While, on the other hand, the largest mortality has occurred in the practice of those who have given freely either opium or alcoholic stimulants."

My conclusions, that the oil had some curative influence, was not, therefore, as you assert, an assumption based on "one or two," or even twelve, recoveries; but, manifestly, it was an inference mainly drawn from the effects of what I believed to be analogous modes of treatment. Your statement, that I did not test the theory by experiment; that I rested mainly on an assumption for the acceptance of my inferences; and that I did not attach much importance to the cases adduced—is surprisingly inaccurate.

My letter in the *Medical Times and Gazette*, before referred to, was mainly a statement of the results of the experiment with castor-oil; with the reasons which led me to employ that remedy, and not to delay the publication of the results already obtained. I have since published full particulars of all my cases in a book (*On Epidemic Diarrhœa and Cholera; their Pathology and Treatment. With a Record of Cases*), which embodies the results of nearly a year's hard and honest work at the pathology and treatment of cholera. The result of my own cases shows, as I think, that my principle of treatment was, in the main, correct. And I have endeavoured to explain the reported ill success of some other practitioners, by showing that, in many instances, the treatment by castor-oil was combined with other measures—especially the administration of brandy and opium—which, in my opinion, were injurious. So much for your statement, that I do "not seem to have attached much importance to the cases adduced."

You evidently believe that the treatment of cholera by purgatives cannot be beneficial, because, as you say, "the thickened condition of the blood following on the abstraction of the serum is prejudicial to life". And this, you think, has been proved by the wonderful efficacy of fluid injected into the veins in bringing back temporarily to life and consciousness patients who were in the last stage of collapse."

This oft repeated argument—this most plausible of "medical errors"—I have met and refuted in the book before referred to, which probably you have not read, but a copy of which I herewith send you.

You deny, or doubt, the existence of a morbid poison as the essential cause of cholera. I suppose you will neither deny nor doubt the existence of very peculiar morbid secretions in the digestive canal. This surely, to use your own words, is "some material thing present in the body of a cholera patient, which has to pass out of his system"; and the proposition, that the removal of these morbid secretions by an unobnoxious purgative may exert a favourable influence on the progress of the disease, is not such a manifest absurdity that it can be disposed of by a sneer.

You say that, "if such a law could be proved of cholera, it ought to be applicable to the whole series of epidemic diseases. For instance, it should have been shown that to rub croton-oil liniment on the skin was the best treatment for small-pox, in order to eliminate the poison by the natural channel through which it finds its exit from the body." This proposition seems to me a palpable *non-sequitur*. I

must confess myself incapable of following you to "the height of this great argument". My main object now, however, is not to discuss with you the pathology or the treatment of cholera, but to protest against what I must call your misrepresentation of my course of reasoning and of my conduct in this matter—a misrepresentation the effect, if not the intention, of which is to hold me up to the reprobation of the profession as having been guilty of culpable rashness and folly.

However much you and I may differ in opinion upon various subjects, I suppose that we shall agree in this: that, whether in conducting a scientific inquiry, or in criticising the opinions and the practice of others, an accurate statement of facts is at least as important as a logical argument.

I am faithfully yours,

To Dr. Barclay.

GEORGE JOHNSON.

P.S. It is my intention to send this letter to the Editor of the BRITISH MEDICAL JOURNAL, with a request that it may be published.

MR. HARTSHORNE AND MR. THURSFIELD.

LETTER FROM R. THURSFIELD, ESQ.

SIR,—Had you kept your wise resolve, expressed in the JOURNAL of the 24th ult., and remained "dumb", you would have spared me some trouble and your readers a great deal of what concerns two parties only, Mr. Hartshorne and myself. Mr. Hartshorne's letter of the 22nd ult. leaves the discrepancies between us a matter of who shall be believed—the man who spoke, or he who heard.

I inclose you the copies of two letters, one from the judge, the other from the registrar of the court, which I must beg of you to insert in your next publication, together with this letter *in extenso*, so that your readers may draw their own conclusions. I quite agree with "Query's" remarks in your last JOURNAL; but Mr. Hartshorne well knows why he did not apply to the Ethical Society. I shall now certainly do so, and at the same time lay before its committee an anonymous communication published in the *Shrewsbury Chronicle*, together with two letters addressed by Mr. Hartshorne to myself, one indignantly denying the authorship of it, and the second admitting he was so; and I shall leave it for future consideration, whether I give them the same extensive circulation Mr. Hartshorne has secured for his charge against myself.

I am, etc., RICHARD THURSFIELD.

Broseley, January 9th, 1865.

[COPY.]

Broseley, January 7th, 1865.

Dear Thursfield,—I well recollect the case of Hartshorne v. Cleeton, and your being called upon by the defendant's advocate to give your opinion thereon. I paid particular attention to the case, and felt so much pleased with the fair and candid manner in which you gave your testimony, that, before leaving the court, I stated to you the impression it had made upon me.

You peremptorily declined to give any opinion (and I think very properly) as to the amount of the fee Mr. Hartshorne was entitled to; but you stated that for your services you should charge the defendant £3:3.

Yours faithfully,

R. Thursfield, Esq.

GEORGE POTTS.

[COPY.]

Astor Hall, Shiffnall, January 7th, 1865.

Dear Thursfield,—In reply to your letter, I beg to say that I believe your statement to be correct.

As far as I remember, you were a very unwilling witness, and refused to give an opinion on the charges of Mr. Hartshorne, but said your own would be £3:3. I conclude you were called upon to give evidence, as you frequently are, from your well known position in your profession, and the certainty of your being in court, to save the expense of a professional witness.

Yours truly, W. CORBETT.

THE INDIAN ARMY MEDICAL SERVICE.

SIR,—Although I am very unwilling to prolong controversy with a "Retired Surgeon-Major," the subject in dispute between us is so important, that I must ask for a little space for a brief rejoinder.

Your correspondent denies having given advice on the choice of a career; "he only said to aspirants for the red jacket, choose the British service." If this be not advice, I should like to know what is. This, however, is a point of no moment; I do not dispute his right to advise, provided only he bases his advice on a fair representation of facts.

In my reply to his first communication, I pointed out that the question of rank was one that could only be settled by the Horse Guards and War Office. When Sir Charles Wood withholds from Indian medical officers any privileges of this kind accorded to their brethren in the British army, it will be time enough to complain. My opponent replies, "Sir Charles Wood has given *substantive* rank to two grades; and what he has the power to do for these, he can do for all." It is strange that the "Surgeon-Major" does not see the Secretary of State's plain meaning. In former years, in the Company's service, inspectors and deputy inspectors general were merely *staff officers*, their appointments were regarded simply in this light. Sir Charles Wood now gives the same definite relative rank to officers in the above grades, as in the British service. If he will inquire at the India Office, he will find at once that this was Sir Charles Wood's meaning. In the Indian Medical Service for the future, an inspector general or a deputy inspector is in the same position as regards relative rank all over the world as in the British army. No more; no less. So that if men are not to go into the Indian Medical Service until this question of rank "is satisfactorily settled," neither should they enter the British army, for the rank of medical officers in both services is alike.

Again, the "Surgeon-Major" is in error in supposing that the furlough pay of Indian medical officers is unsettled. The last despatch, or warrant, as it is erroneously called, was merely supplemental to one that put this essential matter on a new and liberal footing. If your correspondent doubts, let him inquire at the India Office, and he will find it to be as I say it is.

With regard to medical or other funds, they are past praying for: Her Majesty's Government, not wisely, as I think, has abolished them; but when it comes to a comparison between the two services, it should be remembered that both are alike in this particular.

Once more, as to the number of prizes. Of course, every one cannot expect to be an inspector general in the Indian service. Does your correspondent know that in the British service there are only seven inspectors general for the whole army? Like many Indian medical officers, the "Surgeon-Major," I suspect, is not well informed on the subject of pensions in the British army. No British medical officer has any right to a pension at all until he has served twenty-five years on full pay. If he claims a pension at that time, he must have a certificate from a board

of medical officers, to the effect that his health unfits him from further service; if he cannot obtain this certificate, he must serve on, or retire on a lower rate of pension. And the highest rate after the longest possible service is £600 a year. Compare this with the scale of pensions graduated according to service, *not health*, in the new Indian medical scheme. When I said that an officer might retire on £800 a year, I was writing of one who had served his five years as inspector general. Here is an example. Dr. Macpherson of Madras has seen twenty-seven years service, and has served five in the grade of inspector general; and this officer may, and probably will retire on the sum I mentioned. Under the old rules a member of the medical board could retire on £700 a year, *not*, as the "Surgeon-Major" says, £900.

And now with regard to what I said as to *stoppages*. I am quite aware of the rules regarding "privilege leave," without loss of allowances; what I alluded to was another matter entirely. A surgeon, we shall suppose, lands in Calcutta; his regiment is 600 miles up country, or more. Under the old rules he could draw no staff allowance until he joined. Under the new he gets what is now termed "unemployed pay," on a liberal scale, which is available also on leave on private affairs other than *privilege leave*.

Your correspondent is right as to the error of the writer in the *Spectator*, but for that I am not responsible. I have only to say, in conclusion, that I have served more than twenty-two years in India, and that circumstances, into which I need not enter here, make it necessary for me to know pretty exactly the emoluments of medical officers of both services.

I am, etc., D. J. G.

ABSINTHISM. According to Dr. Emile Decaisne, the consumption of absinth has of late years increased to an enormous extent in France. It is made by infusing in alcohol ends of wormwood, both major and minor (*sommités d'absinthe*, from which the liquor takes its name), angelica root, *calamus aromaticus*, aniseed, dittany seeds, and common marjoram. Some distillers, however, vary the recipe, and use fennel, mint, and balm. The concentration of the degree of the alcohol is generally very high. Indigo, tincture of turmeric, juice of hyssop, and nettles, are called to aid to improve the colour and appearance of the pernicious draught. The effect of absinth is to produce a superabundant activity of the brain, a cerebral excitement which at first is agreeable. The intoxication "comes on rapidly; the head swims; and the effect produced is nearly the same as that of poisoning by a narcotic, which certainly does not occur with an equal dose of brandy. With the absinth-drinker, as with the brandy-drinker, the excitement the liquor produces diminishes daily in intensity. Each day he is obliged to augment the dose, in order to screw himself up to the right pitch." The diseases brought on by drinking brandy are produced much more rapidly by the use of absinth. One of the greatest dangers of absinth, says Dr. Decaisne, consists in its adulteration. Dr. Decaisne has observed more than 150 cases of chronic absinthism, and concludes that absinth ought to be prohibited. He has convinced himself that absinth, even of good quality and in moderate doses, sooner or later invariably produces disorders in the human economy. He considers that the extent to which it is now consumed in France demands the intervention of Government. He declares that the pale green demon has invaded all classes of society, the idler and the workman, the soldier and his officer; all professions, those who work with the brain, and those who work with the hand, swallow it with frenzied eagerness.

Medical News.

APOTHECARIES' HALL. On January 5th, 1865, the following Licentiates were admitted:—

Haslewood, Albert Octavius, Darlington, Durham
Meeres, Albert, Haddenham, Bucks
Milburn, Frederick Lefevre, Aldringham, near Saxmundham
Somerset, William Porter, Claydon, Bucks
Wilson, Henry, 393, Strand

APPOINTMENTS.

ROYAL NAVY.

ASHFORD, J. W., Esq., Assistant-Surgeon, to the *Donracl*.
DEVONSHIRE, C. J., Esq., Assistant-Surgeon, to the *Penguin*.
DOYLE, E. W., Esq., Acting Assistant-Surg., to the *Princess Royal*.
MEIKLEJOHN, John A. S., Esq., Surgeon, to the *Columbine*.
RICHARDSON, F. H., Esq., Assistant-Surgeon, to Jamaica Hospital.

VOLUNTEERS. (A.V.=Artillery Volunteers; R.V.=Rifle Volunteers):—

JACKSON, V., Esq., to be Assistant-Surgeon 4th Administrative Battalion Staffordshire R.V.
NESBITT, F., Esq., to be Assistant-Surgeon 4th Administrative Battalion Staffordshire R.V.

DR. SIEVEKING has been elected a director of the Briton Medical and General Life Association, in the place of Mr. W. Manton deceased.

UNIVERSITY COLLEGE HOSPITAL. A gift of £100 has been received from J. Hibbert, Esq., of Maidenhead.

HORSE-RACING AND CHARITY. We are not quite certain into which category of philanthropists to place Mr. Joseph Bond, who for many months has been aiming to mitigate all the woes of humanity by devoting a certain regulated proportion of the stakes in all horse-races above fifty pounds in value to the purposes of hospitals. Mr. Bond's ingenious idea has for a long time been very generally acted upon on the continent of Europe. The infamous gambling dens of the Palais Royal were compelled by the terms of their lease to set aside a portion of their ill-earned profits for the benefit of the hospitals and the poor of Paris; but the four or five hundred thousand *frances* which annually flowed into the *Bureau d'Assistance* and the coffers of the Hôtel Dieu from this polluted source did not deter the Municipality of Paris from at last abolishing a scandalous nuisance. The rouge-et-noir rooms of Aix-la-Chapelle for a long time warded off their impending doom by large contributions to charitable institutions. Homburg continues to mingle a factitious charity with the abominations of its Kursaal; and from the profits of the roulette table contrives to support all the almshouses and hospitals of his chief and only town. Mr. Bond seems to have argued that betting was like gambling, and that the Homburg system of making naughtiness assist suffering virtue might be advantageously transferred to England. Now, considering Mr. Bond as a racing philanthropist, we confess we cannot regard his hospital scheme with any special favour. There is absolutely no connection between the turf and charity. We dare say the hospitals would like the arrangement well enough; but racing men would be apt to regard the philanthropic clause as a tax, then to resent it as an imposition, and finally to denounce it as a swindle. Mr. Bond might move the hearts of the sporting fraternity were he to deliver a discourse on "Horse-racing and Hospitals" at the Spread Eagle at Epsom, the night before the Derby. But we strongly object to making that which should be in every case a voluntary and spontaneous act in any way obligatory. Charity on compulsion is no charity at all. (*Daily Telegraph*.)

THE VENEREAL DISEASES COMMISSION. Dr. Babington has been nominated a member of the Commission on Venereal Diseases, appointed by government in place of the late Dr. Kirkes.

SUICIDE OF A SURGEON. An inquest was lately held on Mr. E. Humpage, lately living at Bristol, a surgeon. The jury found "that the deceased died from the effects of a dose of prussic acid taken while in a state of insanity from affection of the brain."

THE ALKALI WORKS REGULATION ACT. The Alkali Works Regulation Act has now been in force twelve months. The object of the legislature was to compel manufacturers to condense at least 95 per cent. of the hydrochloric acid evolved in the production of soda from common salt. The operation of the present Act is strictly confined to alkali works. Sulphurous fumes from copper works are allowed to escape as before; and the most careless management of chemical works still remains without government interference. There is no difficulty in the way of complete condensation of the hydrochloric acid. The wilderness around St. Helens, however, is not likely soon to blossom as the rose. It is still what it was described by a witness before the Commission, "one scene of desolation. You may look round for a mile, and not see a tree with any foliage on whatever." The fact is, that only this one "noxious vapour" has been suppressed. Others no less deadly, but almost as easily prevented, are still allowed to escape as freely as before, and while these are at large the country round St. Helens can never be like what it was fifty years ago. The satisfactory results of the Alkali Act will no doubt encourage the legislature to proceed further in the same direction.

RETENTION OF DEAD BODIES IN HOUSES. Dr. Barnes has drawn up certain suggestions with the view of diminishing the dangers resulting from the undue retention of the bodies of the dead in inhabited houses, and has submitted them to the General Purposes Committee of the Association of Medical Officers of Health. He says that, there appear to be five principal quarters to which appeal for aid in carrying out measures for diminishing the evil may usefully be addressed:—A. The medical profession generally (through the medical press). B. The vestries, district boards, and boards of guardians (these to appeal to the public). C. The registrar-general. D. The cemetery companies and undertakers. E. The hospital authorities. He recommends as follows:—*For the Vestries.* E. 1. That a circular be prepared for submission to the vestries and district boards, setting forth the dangers arising from the existing practices relating to the dead previous to burial, and containing the following recommendations with a view to the diminution of such dangers. The circular to be sent, in the first instance, to the medical officer of health of each board, requesting him to submit it to his board. 2. That the extreme importance of providing some suitable place for the temporary deposit of dead bodies previous to interment be urged upon the vestries and district boards. That the vestries and district boards be requested to use their influence with their boards of guardians to allow the use of the parochial dead-houses for this purpose. 3. That as a sanitary measure, the vestries and district boards issue a public notice to be permanently maintained, as by painting on boards, and by printed placards, directing attention to the public danger resulting from the undue retention of the dead amongst the living, and stating that in cases of urgency the bodies of the dead may be deposited in the parochial dead-house under the security of a responsible officer, until arrangements are completed for the burial. [The construction of regulations for

the reception and care of the dead in the parochial (avoid the word "workhouse") dead-house or "mortuary" will require some consideration.] 4. That undertakers be informed that dead bodies can be received in the parochial mortuary, and be encouraged to deposit them in this place, rather than to keep them on their own premises. 5. That the undertakers and the master of the poor-house be instructed in every case of a person dying in the poor-house of scarlatina, fever, or other infectious disease, especially to surround the corpse with charcoal. 6. That the undertakers employed by the boards of guardians be instructed when sent to bury a body from the dwellings of the poor, to surround it with charcoal. 7. That the vestries and district boards be invited to consider the propriety of applying to the legislature for the enactment, in an amended Diseases Prevention and Nuisances Removal Bill, or otherwise, of clauses empowering them, as sanitary bodies, to provide mortuaries, and their medical officers to order the removal of corpses to such mortuaries, similar clauses being contained in the City Sewers Act. c. 1. That the registrar-general be requested to append a note to the forms of certificates of the cause of death supplied to medical men recommending the use of charcoal in the manner described. 2. That the public be earnestly invited by placard (?) or by a notice, to be given in every case by the registrar, when applied to by the friends of the deceased for a certificate of the cause of death, to see that the body is surrounded by charcoal as soon as placed in the shell or coffin. D. 1. That a circular be sent to the cemetery companies, requesting them to establish depositories for the dead in convenient places for the reception of bodies waiting interment in their respective cemeteries. 2. That the funeral companies and leading undertakers be invited to establish convenient depositories, such as would, for decency and care, command the confidence of the public. *Measures for the Hospitals.* E. 1. That a circular be issued (either by the Association or from the vestries) to each of the metropolitan hospitals, inviting the authorities to take measures that every dead body, before being allowed to leave their dead-houses, shall be duly surrounded with charcoal. [In support of this request, attention should be drawn to the frequent propagation of disease by the neglect of disinfection; to the fact that bodies are sometimes removed from hospitals to the house of friends or to the premises of undertakers before interment, and that the observance of this precaution would act as a great encouragement to the general adoption of similar means amongst the public.]

UNIVERSITY OF OXFORD. The second examination for the Degree of Bachelor of Medicine was held on December 2nd: examiners, Dr. Acland, Dr. Chambers, and Dr. J. W. Ogle. In *Medical and Surgical Pathology*, the questions were on the following subjects:—The microscopical appearances of encephaloid carcinoma and fibro-plastic growth; leucocythemia; the diagnosis of typhus and typhoid fever; the causes of general anasarca; the conditions under which urine contains albumen, sugar, and pus-globules; the conditions producing jaundice, and those in which it may be considered remediable; the characteristics of general paralysis of the insane; and the diseases for which it may be mistaken; the diagnosis of hæmorrhage into the spinal cord; the varieties of hernia in the abdomen, with an enumeration of the swellings which may occur in the inguinal and scrotal regions, besides hernia; and the various modes of growth in fibrous tumours of the uterus. In *Materia Medica and Pharmacy*, the candidates were asked to mention the official preparations of the *British Pharmacopœia* containing opium, and the proportions; the chief

diuretics used in England, and their doses; the "mixtures" in the *British Pharmacopæia*, and their composition; the composition of pulvis jalapæ compositus, of the pilula scillæ composita, of liquor morphinæ hydrochloratis, and of liquor strychninæ of the *British Pharmacopæia*; the medicines which impart colour to the excretions; the preparations of iron in the *British Pharmacopæia*; the use of ferri peroxidum hydratum, and the method of making it; the classes of medicines fitted for preparation by decoction or for infusion; the making of liquid extracts; the temperature at which linseed, mustard, charcoal, and yeast poultices are to be made; the principle of volumetric analysis; the French equivalents of the weights and measures employed in the *British Pharmacopæia*. In *Therapeutics*, the candidates were required to give an outline of the mode of treatment of acute rheumatic fever; the treatment of a case of pneumonia supervening upon delirium tremens, and the probable result of the treatment; the steps required by the law of England to be taken before a person of unsound mind can be put under bodily restraint; the line of treatment in a well marked case of pyæmia; the treatment of the various forms of uterine hæmorrhage, its several causes being borne in mind; the steps to be taken if a woman, previously healthy, were seized with convulsions during labour; the measures to be adopted in spasmodic stricture of the urethra; the indications for the use of, and contraindications against the use of, elaterium, digitalis, aloës, and copaiba, severally in various diseases; the poisonous doses of the official preparations of opium respectively, and the treatment of deep narcotism from that drug. In *Forensic Medicine and Hygiene*, the questions were on the symptoms by which the candidates would seek to form a diagnosis between intoxication from alcoholic drinks, and concussion of the brain; the process of testing the contents of the stomach of a person suspected of having been poisoned by arsenic; the symptoms of a poisonous dose of belladonna and of hydrocyanic acid; the symptoms of poisoning by oxalic acid, and the *post mortem* appearances; the evidence that an infant found dead had not breathed; the several ways by which a room, or a ward, may be ventilated; the impurities which have been detected in the air of sick rooms; the mode in which typhoid fever is said to be propagated; the conditions under which drinking water is usually contaminated by lead; and the names of any diseases which make butchers' meat wholly unfit for human food. Then followed a clinical examination of cases in the Radcliffe Infirmary, regarding which the candidates were required to give with care the history, diagnosis, and prognosis of the cases, and also the treatment recommended; and to add such general remarks as might occur by way of clinical comment. They were then asked to describe a specimen of urine, to describe and sketch a microscopical object, and to describe a morbid product. Then followed a translation from Morgagni, of a case of rupture of the left ventricle, regarding which the candidates were asked to relate any similar case which they might have seen or heard of; and to state the probable condition of the cardiac muscular fibres. The examination ended with a translation from the Greek of Aretæus.

BOOKS RECEIVED.

1. Lectures on Man. By Dr. Carl Vogt. Edited by James Hunt, Ph.D. Anthropological Society. London: 1864.
2. Two Months of Fever Duty in the Glasgow Royal Infirmary. By W. T. Gairdner, M.D. Glasgow: 1865.
3. The Painless Extinction of Life in Animals Designed for Human Food. By H. MacCormac, M.D. London: 1864.
4. Undine. Translated from the German by Anne Burden. Belfast: 1864.

OPERATION DAYS AT THE HOSPITALS.

MONDAY.....Metropolitan Free, 2 P.M.—St. Mark's for Fistula and other Diseases of the Rectum, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.
 TUESDAY.....Guy's, 1½ P.M.—Westminster, 2 P.M.—Royal London Ophthalmic, 11 A.M.
 WEDNESDAY...St. Mary's, 1 P.M.—Middlesex, 1 P.M.—University College, 2 P.M.—London, 2 P.M.—Royal London Ophthalmic, 11 A.M.—St. Bartholomew's, 1.30 P.M.
 THURSDAY.....St. George's, 1 P.M.—Central London Ophthalmic, 1 P.M.—Great Northern, 2 P.M.—London Surgical Home, 2 P.M.—Royal Orthopædic, 2 P.M.—Royal London Ophthalmic, 11 A.M.
 FRIDAY.....Westminster Ophthalmic, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.
 SATURDAY.....St. Thomas's, 1 P.M.—St. Bartholomew's, 1.30 P.M.—King's College, 1.30 P.M.—Charing Cross, 2 P.M.—Lock, Clinical Demonstration and Operations, 1 P.M.—Royal Free, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.

MEETINGS OF SOCIETIES DURING THE NEXT WEEK.

TUESDAY. Pathological Society of London, 5 P.M.
 THURSDAY. Harveian Society of London, 5 P.M. Dr. H. C. Stewart, "On the Diagnosis of Embolia affecting the Great Vessels of the Heart, with Cases."

TO CORRESPONDENTS.

* All letters and communications for the JOURNAL, to be addressed to the EDITOR, 37, Great Queen St., Lincoln's Inn Fields, W.C.

COMMUNICATIONS.—To prevent a not uncommon misconception, we beg to inform our correspondents that, as a rule, all communications which are not returned to their authors, are retained for publication.

CORRESPONDENTS, who wish notice to be taken of their communications, should authenticate them with their names—of course, not necessarily for publication.

LITHOTRITY.—Mr. Charles Hawkins has published in a pamphlet form his excellent article on "Lithotritry," published in the last volume of Holmes's *System of Surgery*; and has appended to it the account of a case of calculus in the bladder removed by lithotritry, in which a communication existed between the bladder and intestine, published in the first volume of the *Medico-Chirurgical Transactions*.

MR. HARTSHORNE.—A correspondent writes: "On seeing Mr. Hartshorne's letter in our JOURNAL, my first impression was, that if he had any complaint to make against a professional brother, and a member, moreover, of the same Ethical Society as himself, it was his duty in the first instance to have laid it before the Council for their adjudication; and, if reasonably dissatisfied with their decision, he might then with some show of justice have made a public appeal to his brother practitioners through the columns of the JOURNAL."

VILE PRODUCTIONS.—SIR: I have had the enclosed sent to me (a London postmark) within the last few days. Pray take some notice of the abominable production; it is bad enough to have the vile notices before one in every country newspaper, still worse to have such an infernal torpedo flung into an unsuspecting household. I am, etc. M.D. LOND.

[The legislature alone can effectually reach these villainies. This is only one of many scores of a similar cast. EDITOR.]

NON-MERCURIAL TREATMENT.—SIR: In your issue of December 24, 1864, there is an account of three cases of syphilis, under the care of Mr. Dunn, at the Farringdon Dispensary, in which the non-mercurial plan of treatment is used. In Cases I and II, I find that an ointment containing nitric oxide of mercury is prescribed; and Case III had previously taken grey powder, and had used mercurial ointment. Might I venture to ask if such is strictly within the limits of the non-mercurial treatment?

I am, etc. ED. LLOYD HARRIES FOX, M.B. Lond.

Broughton, Hants. December 26th, 1864.

COMMUNICATIONS have been received from:—Dr. HENRY MARSHALL; Dr. HARRISON; Dr. DURRANT; Dr. BARCLAY; THE HONORARY SECRETARIES OF THE HARVEIAN SOCIETY; DEPUTY INSPECTOR-GENERAL; Mr. A. H. DOLMAN; Dr. W. H. O. SANKEY; Dr. B. W. RICHARDSON; Dr. TERNBULL; Mr. LUND; Mr. WILLIAM CONEY; Mr. CURGENVEN; Mr. THURSFIELD; Dr. ALEXANDER FLEMING; Dr. G. JOHNSON; Dr. SKINNER; M.D.; Mr. RICHARD GRIFFIN; Mr. W. J. CLARKE, JUN.; and THE HON. SECRETARIES OF THE OBSTETRICAL SOCIETY OF LONDON.

ADVERTISEMENTS.

Salmon's Obstetric Binder, for

immediate use after delivery. 5s. each.

SALMON'S ELASTIC ABDOMINAL BELTS, adapted for all cases requiring support, especially for Ladies' use before and after Accouchement, from 12s. to 42s.

Elastic Stockings, from 4s. to 16s. Knee-caps, Trusses, Suspensories, Railway Conveniences, Chest Expanders, etc.

Mrs. Salmon attends upon Ladies.

HENRY R. SALMON, 32, Wigmore Street, Cavendish Square, London, W. Private Door.

TO PHYSICIANS, SURGEONS, AND DRUGGISTS.

Brown's Cantharidine Blistering

TISSUE, prepared from pure Cantharidine. An elegant preparation, vesicating in much less time than the Emp. Lyttæ P. L., easily applied and removed, and will not produce strangury or troublesome after-sores. It has received the sanction and commendation of many of the most eminent practitioners in the kingdom.—In tin cases, containing ten feet, 6s. 6d.; and small cases of five square feet, 3s. 6d. each.

BROWN'S TISSUE DRESSING.

An elegant, economical, and cleanly substitute for all ointments as a dressing for Blisters, Burns, etc., and may be called a companion to the above. In tin cases, containing twelve square feet, 1s. 6d. each.

Sole Inventor and Manufacturer, T. B. BROWN, Birmingham. Sold by all Wholesale and Retail Druggists and Medicine Agents throughout the British Empire.

For Family Arms.

CULLETON'S HERALDIC OFFICE, the established authority for furnishing Family Arms, Crests, and Pedigrees. Send name and county. Arms quartered and impaled, plain sketch, 3s. 6d.; in heraldic colours, 6s. Arms, Crest, and Motto, with heraldic description, beautifully painted in rich colours, 12s. Family Pedigrees traced from authentic records. By T. Culleton, Genealogist, 25, Cranbourn Street (corner of St. Martin's Lane).

Culleton's Heraldic Office, for Engraving

Arms on Stone, Steel, and Silver, according to the laws of Garter and Ulster King-at-Arms, by authority. Crest on Seals or Rings, 7s. 6d.; Book Plate engraved with Arms and Crest, 15s.; Crest Plate, 5s.—T. Culleton, engraver to the Queen, by authority (April 30, 1852), and Die-sinker to the Board of Trade, 25, Cranbourn Street (corner of St. Martin's Lane), W.C.

Culleton's Solid Gold Signet Rings, 18-

carat, Hall marked engraved with any Crest, 42s.; ditto, very massive, for Arms, Crest, and Motto, £3 15s. The Hall Mark is the only guarantee for pure gold.—T. Culleton, Seal Engraver, 25, Cranbourn Street (corner of St. Martin's Lane).

Culleton's Patent Lever Embossing Presses,

21s., for Stamping Paper with Crest, Arms, or Address. Any person can use them. Carriage paid.—T. Culleton, 25, Cranbourn Street (corner of St. Martin's Lane).

Culleton's Visiting Cards. Fifty, best

quality, 1s., post free. Engraving a Copper Plate in any style, 1s.; Wedding Cards, 50 each for Lady and Gentleman, 50 Embossed Envelopes, with maiden name printed inside, all complete, 13s. 6d. Carriage paid. T. Culleton, 25, Cranbourn Street (corner of St. Martin's Lane).

Culleton's Guinea Box of Stationery. No

Charge for Engraving Die with Crest or Motto, Monogram or Address (as charged by other houses), if an order be given for a ream of the best paper, and 500 best envelopes to match, all stamped free and carriage paid for 21s.—T. Culleton, Seal Engraver, 25, Cranbourn Street (corner of St. Martin's Lane).

Culleton's Plates for marking Linen prevent

the ink spreading, and never washes out. Initials, 1s. each; Name, 2s. 6d.; Set of Numbers, 2s. 6d.; Crest, 5s., with directions, post free for stamps.—T. Culleton, 25, Cranbourn Street (corner of St. Martin's Lane).

ESTABLISHED 1848.

MEDICAL TRANSFER & PROFESSIONAL AGENCY,
50, Lincoln's-inn-fields, W.C.

Mr. J. Baxter Langley, M.R.C.S.

(KING'S COLL.), begs to inform the members of the Medical Profession that he has undertaken the Medical Transfer and General Professional Agency business, formerly carried on by the late Mr. Bowmer.

Mr. Langley devotes his prompt personal attention to the negotiations entrusted to him, and treats confidentially and with care all matters relating to professional business. The strictest reserve will be practised in all the preliminary arrangements, and no expense incurred (except in special cases) unless a negotiation be completed.

The General Partnership and Commercial Agency business till recently conducted by him at his City offices, and his experience in the management of large commercial undertakings, combined with his professional acquirements, enable Mr. Langley to guarantee that all matters of business placed in his hands will be carried out without delay, and with an equitable regard to the interests of all the parties concerned.

Mr. Langley can refer to the Professors of his College, Members of Parliament, Clergy, Merchants, Bankers, and others, as a guarantee of his integrity and honour in all negotiations entrusted to him.

Full information as to terms, etc., sent free on application.

Office Hours, from 11 to 4; Saturdays from 11 to 2.

Competent Assistants provided

without delay, free of expense to the Principals. No gentlemen recommended whose antecedents have not been inquired into. Apply to Mr. Langley, 50, Lincoln's-inn-fields, W.C.

In the neighbourhood of London,

a Nucleus of good class Practice, in an increasing locality, for Sale. £50 required. Address, "S., 1,064," Mr. Langley, as above.

Within 40 miles of London—

A Middle Class Family Practice, capable of extension and improvement, for Sale. Population upwards of 25,000. Income upwards of £500. Three months introduction. The Practice has been established 17 years. Reasonable terms. Address, "S., 1,063," Mr. Langley, as above.

First-class Practice or Partner-

SHIP, in one of the very best towns in the West of England, for Transfer. Income about £1,500 a-year. Expenses small. Patients of the highest class. Good house in a pleasant locality. Address, "S., 1,060," Mr. Langley, as above.

In one of the best Towns in

STAFFORDSHIRE, there is an Opening for a Partner, in a Family Practice. Receipts, £1000 a year, capable of large increase by the cooperation of a suitable partner. The Practice has been long established, the patients belong to the upper classes. The opening is an unusually favourable one for a young unmarried practitioner of good acquirements, who might arrange at first to take a third share, and live in the house with the senior partner. Terms moderate; amount in proportion to share required. Address, "S., 1059," Mr. Langley, as above.

Partnership, with a view to early

SUCCESSION. A Gentleman, whose Practice produces upwards of £500 a-year, £170 being from Appointments, desires to make an immediate arrangement to secure the cooperation of a working partner, as he is seriously ill. The Practice is unopposed, and very favourable conditions would be made with a suitable gentleman, in case the Vendor was compelled to retire altogether. Address, "S., 1059," Mr. Langley, as above.

In a large and pleasant Town in

NOTTS, for Transfer, a good Family Practice, well established. Income upwards of £1000. The Successor must be doubly qualified, and should also hold the diploma of M.D. Terms liberal. Address "S., 1055," Mr. Langley, as above.

Medical Assistants.—Wanted

Immediately, several competent In-door and Out-door ASSISTANTS, qualified and unqualified, for Town and Country. No charge for registration, but references in all cases required. Apply to Mr. Langley, 50, Lincoln's-inn-fields, W.C.

Lectures ON ORTHOPÆDIC SURGERY.

BY

BERNARD E. BRODHURST, F.R.C.S.,

OF ST. GEORGE'S HOSPITAL, AND THE ROYAL
ORTHOPÆDIC HOSPITAL, ETC.

LECTURE XV.

ON TALIPES, OR CLUB-FOOT.

(Continued.)

Talipes Valgus occurs both as a congenital and a non-congenital deformity. As compared with talipes varus, it is a rare form of congenital deformity; but it is a very common non-congenital affection.

The *external characters* of this deformity are in some measure expressed in the name by which it is known, which signifies that the foot is twisted outwards. Thus the inner margin of the foot is depressed, while the outer is more or less raised; and the sole presents outwards. From its nomenclature, it would be supposed that this deformity was the reverse of talipes varus; and, if this is not absolutely the case, the name is sufficiently well given, for it expresses the most prominent external characteristic—namely, that the foot is inclined outwards. The general appearance of the deformity, as it is seen in the young child, is shown in the following figure.

Fig. 44.

When the child begins to walk, the great inconvenience of the deformity shows itself. Not only is much lameness produced by the shape which the foot assumes, but pressure on the ground, as in walking, becomes excessively painful. It is only necessary to see such a figure as the following, for instance, to feel sure that such must undoubtedly be the case. The weight of the body is borne on the inner margin of the foot; and pressure may induce ulceration of the integument and troublesome sloughs. This is rare, however. Occasionally, walking becomes impossible without crutches or supports of some kind.

Morbid Anatomy. The following figure (Fig. 45) represents a severe form of congenital deformity;

and yet, even where the deformity is so great, there is seldom to be found any deviation from the normal forms of the tarsal bones. The os calcis always deviates somewhat from its normal position, the tubercle calcis being drawn upwards by the tendo Achillis

Fig. 45.

and the powerful contraction of the muscles of the calf of the leg. In one case which he examined, Mr. Adams found the tuberosity of the os calcis as much elevated as it is in a severe example of congenital varus. The astragalus lies somewhat obliquely; and its head presents beneath the skin on the inner margin of the foot, and is partly uncovered by the navicular bone. The prominence which is formed by it may always be distinguished in congenital valgus. The longitudinal and transverse arches of the foot are obliterated, and even they may be reversed; so that the plantar surface shall present a convex instead of its usual concave form. The scaphoid, cuneiform, and cuboid bones, together with the metatarsal bones, are all more or less altered, not in shape, but in their positions, both absolutely and relatively as regards each other; and the foot is bent upon itself, and everted at the transverse tarsal joint. The following figure shows this better, perhaps, than either of the preceding. (Fig. 46.)

Fig. 46.

The muscles which are especially active in this deformity are the peronei and the extensor longus

digitorum; but also, in general, the muscles of the calf of the leg are retracted, and become serious obstacles in the mechanical treatment of this deformity. The strong ligaments and fasciæ in the sole of the foot are lengthened and much weakened.

Non-congenital Talipes Valgus is, in one or other of its various grades, a very common affection, occasioned for the most part by debility, but arising also from other causes, such as paralysis, spasm, inflammation, and wounds.

The *external characters* of non-congenital valgus have strong resemblances to congenital valgus, and yet there exist differences which enable the observer at once to distinguish between these varieties of deformity.

Non-congenital valgus consists of a flattened condition of the longitudinal and transverse arches of the foot, through which the sole of the foot rests with its inner margin flat on the ground. This condition is induced slowly. At first, it is present only when the weight of the body is borne on the feet, as in standing; and the natural arches are restored on removing the superincumbent weight. But at length the elasticity of the structures which enter into the formation of the sole and arches of the foot is lost, and the foot remains flat. In proportion as the arches are flattened, so is the height of the instep diminished, and the foot becomes somewhat elongated and everted; and, in consequence of these changes, the internal malleolus is brought absolutely nearer to the ground, and its prominence is increased in proportion to the eversion of the foot. These points are shown in the following figure. (Fig. 47.)

Fig. 47.

This flattening of the foot alters absolutely the positions of all the tarsal bones; but perhaps none are affected in a more important manner, or tend to destroy the use of the ankle-joint more, than the calcaneum and the astragalus. The astragalus being placed somewhat obliquely, and the anterior surface of the calcaneum being depressed, together cause a partial locking of the tibio-tarsal joint, which is further increased by the contraction of the muscles of the calf of the leg to render the tendo Achillis tense; thus to prevent painful motion at the ankle-joint. Thus, not only is elasticity lost through the destruction of the arches of the foot, but lameness is rendered still greater by the loss of motion at the ankle-joint. The arches of the foot are destroyed, compressing very painfully the soft structures of the sole in walking (see Fig. 48); and the deformity may

even increase to produce a convex surface towards the ground—the reverse of the natural arches of the foot.

One of the most severe forms of this distortion that has perhaps ever been witnessed, was lately under my care at St. George's Hospital. It was induced

Fig. 48.

as a consequence of extensive ulceration on the dorsum of the foot and by cicatrization in healing. In this instance, the arches of the foot were absolutely reversed; the foot was much everted and flexed, and its outer margin was raised; the tendo Achillis was tense; and there was scarcely perceptible motion at the ankle-joint. The following illustrations show the deformity well. (Figs. 49 and 50.)

Fig. 49.

The *Treatment of Congenital Valgus* varies somewhat according to the degree of deformity which has to be removed. Just as in varus, slight cases of deformity may be treated by mechanical means alone, and without the division of tendons. It is only justifiable, however, to recommend such a course when the deformity is so slight that the treatment may safely be left in the hands of a judicious nurse. In an ordinary case, this mechanical treatment would occupy many months, and it might probably then not be successful.

Lately, I saw a case of congenital valgus, of not a severe grade, which had been treated mechanically for several months, with very little gain except to

the surgeon himself, when he proposed to divide the tendons; for he was then convinced that the operation was necessary. The operation was performed, not however by the bandagist, and the deformity was entirely removed in six weeks.

Fig. 50.

But if, at a tender age, these efforts of bandaging are futile, how much more so must they be in congenital cases at a more advanced age. In many of these cases, the most perfectly adapted mechanism will scarcely avail to remove deformity even after the section of tendons and fasciæ. In the majority of cases, it is sufficient to divide the peronei tendons. If, however, the extensor longus digitorum muscle is retracted, its tendons should also be divided. Then, after the punctures have healed, the foot may be gently and gradually inverted and restored to its normal form, being bound to a pliable splint. In instances of severe distortion, it is frequently necessary, also, to divide the tendo Achillis after the foot has been fully inverted.

In the adult, the treatment will probably occupy as many months as it occupied weeks in the infant. A well adjusted mechanical shoe will be required to remove deformity after the tendons have been divided. The improved instruments which are now in use for the treatment of these cases are very powerful; and they require nice management, lest so much force should be exerted as to injure the soft structures.

The *Treatment of Non-Congenital Valgus* will vary according to the degree of deformity and the cause which gave rise to it. A very large majority of these cases depend on debility; and the deformity may be removed by local support, and by general tonic treatment and rest. No treatment will avail anything without rest—that is to say, rest to the overworked lower limbs.

In paralytic valgus, the deformity may generally be overcome without operation and by mechanical means only. When the affection is recent, this may always be done, and even there is then hope of partial recovery, at least, of muscular power, when attention is given to the cause of paralysis, and means are taken to excite the affected muscles. When the deformity is of long standing, the loss of power will probably remain; and, in consequence of structural shortening which will probably have taken place,

one or more tendons may require to be divided. In these cases, however, the comfort and power which are given by restoring the normal shape of the foot, and by well adjusted mechanical support, are worth anything to one who has been long crippled. Such support may probably be necessary during the remainder of life, that contraction may not again occur.

Spasmodic valgus is rare. It is a sequel of convulsive action, perhaps occasioned by teething or by some other irritating cause; and it remains, for some years perhaps, just as, in another instance, strabismus may remain, or equinus, or any other muscle or group of muscles may remain affected. Without, however, an epileptic condition or a morbidly excitable nervous condition continues, this spasmodic muscular action will probably diminish, and at length cease altogether, without division of tendons. It is necessary to attend to the exciting cause of spasmodic action, rather than to the manifestation itself. Wherever disease of the nervous centres remains, no idea of section of tendons can be entertained: but when irritation and disease have entirely passed away, and this habit (so to say) of increased muscular action is left as the sole indication of former disease, it may be justifiable to divide a tendon and thus to restore the use of a limb.

Inflammation about the foot and ankle—whether by inducing thickening and softening of ligaments and other soft structures, or by causing loss of substance and subsequent contraction—may give rise to valgus; and there is no form in which this deformity can present itself that is more obstinate or difficult to control than this arising from inflammation. A severe case is well nigh hopeless: if it be of long standing, it is intractable; and when it is recent, wounds and sloughs readily form. The only manner in which these cases can be mastered, is to encase the limb in cerate on strips of kid, and then to apply mechanical means as gently as possible.

When the ankle-joint itself has been affected, and partial ankylosis remains as a result of inflammation, the greatest benefit may be derived, after inflammation has entirely ceased, from the section of such tendons as may tend to impede motion. It is rare, however, that the tendons themselves have to be divided. For the most part, it is alone necessary to break through the adhesions after chloroform has been fully administered.

After deformity has been removed, the use of the limb may be regained by various well adapted movements, galvanism, shampooing, the hot air bath, and such other means as may be indicated by the cause and nature of the affection itself. It is necessary, in all cases of this description, that mechanical support shall be worn until the control of the limb has been gained.

LONDON FEVER HOSPITAL. Mr. Charles Squarey, the house-surgeon of the Fever Hospital, is suffering from an attack of typhus fever, which he has no doubt taken in the discharge of his onerous and dangerous duties. Mr. Squarey for many months during 1863 acted as one of the resident surgeons of the hospital, so that this is a second occasion upon which he has so courageously volunteered to do battle against the insidious attacks of fever to which the unusually numerous patients admitted into the hospital during the last year have been subjected.

LEEDS GENERAL INFIRMARY.

STATISTICAL TABLES OF THE OPERATIONS PERFORMED FROM JANUARY TO JUNE, 1864, INCLUSIVE.
Operations for Necrosis and Caries of Bone.

No.	Sex and age.	Operator.	Nature of operation.	Stay in Hospital after operation.	Result.	Remarks.
1	M. 11	Mr. Teale	Removal by gouge of carious part of os calcis.	43 days	Cured. Wound very nearly healed when discharged.	Four sinuses led to caries of the posterior part of the right os calcis. The disease had continued for four years. An incision was made down to the disease, and a hole having been made into the back part of the bone by Mr. Smith's auger, a considerable number of carious fragments were gouged out. The cavity rapidly filled up.
2	F. 19	Mr. S. Hey.	Gouging of carious cavity in inner malleolus.	55 days	Cured. Wound nearly closed.	An opening led directly into a cavity in the inner malleolus of the tibia. The diseased bone was exposed by incision, a free opening made into the cavity by Mr. Smith's auger, and the diseased bone gouged out.
3	M. 8	Mr. S. Hey	Removal of sequestrum.	15 days	Cured, with useful limb.	A loose sequestrum was protruding from the left tibia in front. When removed by forceps, it measured about three inches. The cavity was gouged.
4	F. 5	Mr. Nunneley	Removal of sequestrum.	20 days	Cured.	The left angle of the lower jaw was necrosed. Pieces of sequestrum were removed through the mouth.
5	M. 16	Mr. S. Hey	Gouging os calcis.	33 days	Cured.	Sinuses led to a carious cavity on the inner side of the os calcis. The diseased part was exposed and removed by Mr. Smith's auger and the gouge. After the operation, the wound healed well.

Removal of Innocent Tumours.

No.	Sex and age.	Operator.	Nature of operation.	Stay in Hospital after operation.	Result.	Remarks.
1	F. 30	Mr. Teale	Excision of small epulis from lower alveolus.	7 days	Recovery.	This was a fibrous growth, of the size of a filbert, springing from the periosteum of the lower alveolus on the right side. It was removed by the knife and bone-scissors, along with a superficial piece of the jaw.
2	M. 53	Mr. Teale	Excision of rodent ulcer situated on the right ala nasi.	15 days	Recovery.	About one-half the right ala nasi was destroyed by a rodent ulcer of four months' duration. The base of the ulcer was freely removed by the knife. When discharged, the wound was nearly cicatrised.
3	F. 34	Mr. Teale	Excision of bursal tumour from both patellæ.	15 days	Recovery.	Over the right patella was an almost solid bursal tumour as large as a pigeon's egg, which had commenced five years before; and over the left knee a similar growth, of the size of a walnut, of like duration. After removal, both wounds healed rapidly and well.
4	F. 6	Mr. Teale	Excision of small epulis from upper alveolus.	13 days	Recovery.	A small glandular epulis was removed by bone-scissors and gouge from the centre of the upper alveolus, in the situation of the front incisor teeth, which had previously been extracted.
5	M. 61	Mr. Teale	Removal of simple fibro-cellular polypus from right antrum.	13 days	Recovery.	Forty years before admission, polypi were removed from both nostrils; and every two years, for five or six times, the operation was repeated. No return took place until July 1863, when the right nostril again became the seat of the disease; and in the same month the upper part of the right cheek began to bulge. The nasal polypus was again removed, but the cheek continued to swell, and at the time of his admission presented two nodules—each the size of half a walnut—below the orbit. The operation was commenced as if for excision of upper jaw by two incisions—one reaching from the malar bone to the nose immediately below the orbit, and the other from the inner canthus downwards by the side of the nose and through the upper lip; the flap thus marked out was turned outwards, and a mass of ordinary polypus, which had made its way through the anterior wall of the antrum, was at once exposed. The whole was gouged away, and the flap laid down again. Union was rapid, and his recovery apparently complete.
6	F. 41	Mr. Teale	Excision of fatty tumour.	20 days	Recovery.	The tumour was pendulous, was situated over the right trochanter, and weighed about a pound.
7	F. 40	Mr. P. Teale	Excision of adenocoele from left breast.	22 days	Recovery.	The tumour was situated in the outer part of the breast, and was as large as a hen's egg.
8	F. 46	Mr. Nunneley	Excision of fatty tumour.	22 days	Recovery.	The growth was about the size of half an ordinary cocoa-nut, was situated over the epigastrium, and was of three years' growth.
9	F. 47	Mr. P. Teale	Excision of small cheloid.	Out-patient	Recovery.	This was a small cheloid growth of the skin in the summit of the left shoulder.
10	F. 40	Mr. P. Teale	Excision of small cheloid.	Out-patient	Recovery.	A small cheloid tumour situated over the upper part of sternum.
11	F. 40	Mr. P. Teale	Excision of adenoid tumour of breast.	14 days	Recovery.	An adenocoele of the left breast, about as large as a pigeon's egg.

Operations for the Cure of Aneurism, Nævus, etc.

No.	Sex and age.	Operator.	Nature of operation.	Stay in Hospital after operation.	Result.	Remarks.
1	F. 9 w.	Mr. S. Hey	Application of nitric acid to nævus.	13 days	Cure.	The nævus affected the skin of the cheek and lower eyelid. That on the cheek had been previously excised by the knife. Nitric acid was carefully applied to the disease affecting the eyelid. A slough and cicatrization followed, which resulted in cure of the disease without deformity.
2	F. 7 m.	Mr. Teale	Excision of nævus.	12 days	Cure.	The nævus was situated on the right cheek, was as large as a walnut, and involved both skin and subcutaneous cellular tissue. The whole was removed by the knife.
3	F. 10 m.	Mr. Teale	Excision of nævus.	Out-patient	Cure.	The nævus was situated on the left side of the head, and was about the size of a sixpence.
4	F. 5 m.	Mr. P. Teale	Enucleation of large parotid nævus.	5 days	Death.	The nævus was very large, and chiefly subcutaneous. It measured about an inch and a half in diameter, and occupied the lobule and inferior part of the helix of the ear and the whole parotid region. The skin was dissected off, and the growth removed by enucleation. Death was caused by convulsions. The child had been subject to laryngismus stridulus.
5	M. 26	Mr. P. Teale	Compression and ligature of femoral artery for popliteal aneurism.	60 days	Recovery.	An aneurism, about as large as an ordinary cocoa-nut, completely filled the right ham. Pain in the part about a month, but no tumour noticed until sixteen days before admission. Symptoms and signs of aneurism well marked; also very loud musical regurgitant aortic murmur. Swelling had during the last few days become more solid, and on its surface several enlarged anastomosing vessels could be felt; no treatment for six days beyond rest in bed; pulsation had then increased; aneurism decidedly larger. Signoroni's tourniquet applied over femoral artery in the groin, and was removed in an hour and a half because of pain. During following three days, pressure for a short time at intervals. Swelling continued to increase; knee-joint became somewhat distended with fluid; œdema of leg became more manifest; and pain very severe. Femoral artery was tied at the apex of Scarpa's triangle. After operation, everything went on well; pulsation ceased, and did not return; aneurism quickly solidified, and gradually lessened; œdema disappeared; pain ceased; collateral circulation rapidly established; and on discharge, only a solid tumour of the size of a small orange. The ligature was cast off on the eleventh day.
6	M. 6 m.	Mr. P. Teale	Introduction of setons for the cure of nævus.	16 days	Partial cure.	The nævus occupied the lower half of the nose and its septum, and extended through the entire thickness of the middle third of the upper lip. That on the nose only was treated on the present occasion. Setons of silk were passed through its substance in various directions, and left there until fourteen days afterwards, at which time the part of the growth so treated was quite solid. A second similar operation was performed three months later. After which, the growth seemed to have lost its navoid structure.
7	M. 5 m.	Mr. S. Hey	Excision of nævus.	Out-patient	Cure.	The nævus was about the size of a fourpenny-piece, and situated on the forehead.
8	M. 17	Mr. Nunneley	Aneurism by anastomosis treated by ligature of vessels and introduction of setons.	33 days	Partial cure.	The disease occupied the whole upper lip (which was enlarged to more than twice its normal size), and had followed immediately upon a blow by a stone when the patient was six years old. The two enlarged superior coronary arteries were tied, and through the substance of the lip three double thick silk setons were passed. Considerable suppuration having been set up along the track of the setons, they were removed at the end of twenty-six days. When seen three months later, the lip was considerably lessened, felt solid, and pulsated less strongly. The operations were repeated, and the setons left in fifteen days, with the result of still further solidifying the lip, and diminishing pulsation. This case is still under treatment.
9	M. 37	Mr. Wheelhouse	Compression and ligature of femoral artery for popliteal aneurism.	47 days	Recovery.	Right ham was completely filled by a large aneurism, which had first appeared six weeks before admission; though for two or three weeks previously to finding the swelling, the patient had acute pain in and around the right knee. Up to the commencement of the disease, he had been engaged for several weeks on a farm, in digging a hard clay soil, using the right foot constantly to press the spade. No other hours each day for thirteen days. When the aneurism had become solid, and pulsation nearly ceased, all treatment was suspended. Ten days later, pulsation slightly increased; and at its most prominent part, the skin became thin, red, and conical. Fearing lest the sac might burst, Mr. Wheelhouse tied the femoral artery at the apex of Scarpa's triangle. All threatening signs left; pulsation ceased; eight days after which he was allowed to get up. When seen lately, there was still a very large hard tumour in the ham, but no pulsation. He did not suffer pain, and there was no œdema. There was a feeling, however, of fluctuation on the outer side of the tumour in a limited space.

Excisions of Joints of Bones.

1	F. 26	Mr. Teale	Excision of os calcis.	80 days	Recovery, with useful foot.	Right heel had become the seat of disease three years before. At the time of admission, six sinuses—all leading to the os calcis, which was felt bare—surrounded the heel. Transversely across the sole opposite and down to the calcaneo-cuboid joint, the other commencing at the outer extremity of the first: and extending directly backwards along the outer border of the heel as far as the insertion of the tendo Achillis; and thus was mapped out a large flap, comprising the whole of the tissues of the heel, which was dissected up and turned inwards. As the os calcis alone was found to be in a carious condition, it was removed, whilst the other bones were left. The flap lived and united well; and at the time of her discharge the wound had nearly closed. When seen some months afterwards, the foot was quite sound; and, with the exception of a little puckering, there was no deformity. She had not then tried to walk upon it, but was ordered to do so.

Original Communications.

RETROSPECTIVE NOTES ON OUT-PATIENT PRACTICE.

By C. M. DERRANT, M.D., Physician to the East Suffolk and Ipswich Hospital.

IN reading the valuable and interesting paper by Dr. Ransome, of Bowdon, Cheshire, "On the Need of Combined Medical Observation", I was particularly struck with the following remarks.

Speaking of the literary labours of the medical profession, Dr. Ransome observes: "All the more curious and rare forms of disease are thus brought to light, and carefully studied. Eminent men connected with hospitals contribute the results of their experience in the treatment of intricate or dangerous cases, and give their opinion upon difficult questions of diagnosis or pathology. In truth, our officers fight well; but the rank and file of the profession, more trained to observe, and thoroughly capable of giving material aid, yet find no direction pointed out, in which they might also push on the advance of their science. There still remain to be gathered in many items of observation, each, by itself, apparently unworthy of record and too unimportant to advance the reputation of any one, which, when massed together, would form a most valuable store of evidence."

It is to this "rank and file", or, in other words, the busy, practical, general practitioner—he who is accustomed to deduce facts from his own experienced observations, and who is ready and anxious, in return, to receive short practical deductions from the daily observation of others—that the incalculable value of the record of "combined medical observation" must especially apply.

When we consider the enormous amount of practical lore that might be culled from the observation of a portion only of the members of our large Association, were that to be, systematically and in a few words, committed to paper, we can only regret that so much valuable matter is lost to the profession, and which would, if duly registered, prove of such inestimable assistance to the young practitioner.

Often, in my own neighbourhood, when I have asked my busy medical friends why they do not briefly jot down the result of their own every day valuable experience, have I been met with the following replies: "I have no time"; or, "Anything that I could say would be of no value"; or, "To detail a case properly would occupy more time than I can afford." Now, it is to this latter reply that I would mainly advert.

I have constantly heard it asked, "Why do not our journals contain shorter and more practical papers; inasmuch as it is impossible that the mind, harassed and over-fatigued with its daily round of toil, can appreciate or digest the more lengthy, yet more valuable, matter that is weekly put before us?"

While inculcating the advantages which I think would obtain by the record of the large experience of busy practitioners, scattered over different districts, and accumulated under different circumstances, I would by no means ignore, or in any way depreciate, the great value of the labours of those who, from possessing more time and talent, are enabled to give the result of their deeper researches towards the unravelling of the more intricate phenomena of disease.

It appears to me, however, that what we require in

addition, is a brief, but faithful, detail of facts, emanating from every grade of practitioner, and giving the results of his personal experience; more particularly in reference to the value of remedies, the effects of atmospheric changes, and the influence of locality; and, also, the importance of particular symptoms, with a view to a correct diagnosis. The collection of facts bearing upon these points may appear trivial to him who is called upon to make them; but, in the aggregate, they cannot but prove of inestimable value, as the result of concurrent labour, worked out in different localities and under varying circumstances, but each having the same grand object in view; viz., the advancement of his profession, and the good of his fellow man.

Having made these observations, I propose now to give a cursory detail of the class of cases that have presented themselves as out-patients within the last two years at our local hospital. In doing so, I shall confine myself to those that have fallen under my own care; making such brief remarks upon symptoms and treatment as the nature of the case may warrant.

The town of Ipswich stands in a valley, in the midst of a purely agricultural district. The locality, in warm weather, especially for the young and to those unacclimatised, is relaxing; and, consequently, we find disease assuming, more or less, the asthenic type. Acute diseases, as obtaining among out-patients, is very rare; but the more chronic and tedious forms present themselves in almost every variety for relief; and this is especially seen in the different forms of pulmonary and gastric disorder.

In noticing the diseases classed under the several heads, I shall consider them in reference to their frequency of occurrence.

NERVOUS SYSTEM.

1. *Cerebral Congestion.* This is a common form of complaint; and, when not arising from direct cardiac disease, it may be more frequently attributed to a deficient propelling power of the heart, and a turgid, languid condition of the venous system generally. Atmospheric influence, with the depressing effect of long continued east winds, greatly aggravate the congestive tendency.

The patient complains of "confusion", headache, and depression of spirits, giddiness, singing in the ears, muscæ and sometimes scintillations, and occasional nausea, although this seldom amounts to actual vomiting.

In the more severe cases, cupping between the shoulders has acted most favourably. Repeated blisters behind the ears; and, if the symptoms be obstinate, a seton in the nape of the neck, are useful. The bichloride of mercury is certainly useful in this affection. Ammonia, with the spirit of nitrous ether and tincture of colchicum; and acting steadily upon the bowels with neutral salts in occasional combination with the compound decoction of aloes should be employed.

The urine should be always carefully tested, both for albumen, oxalates, and excess of uric acid.

2. *Neuralgia.* The forms which this affection has presented during the two years have been Facial Neuralgia; Hemisrania; and Sciatica.

Facial neuralgia, when not depending upon decayed teeth or intracranial disease, may, in general, be traced to one of two exciting causes: 1, a general deficiency of nerve-tone, the result sometimes of malaria; and 2, which among all classes is a very common excitant—viz., a deranged condition of the digestive organs. In the treatment of the first variety, quinine, with or without cod-liver oil, will often effect a speedy cure; but I have, as a rule, found drachm doses of the sesquioxide of iron of the *London Pharmacopœia* more to be relied on.

Regulation of the bowels and attention to diet are, of course, very important auxiliaries.

In the treatment of the second, or gastric variety of facial neuralgia, the duration of the complaint is, I believe, often much prolonged by the too early exhibition of tonics, especially quinine. I have so frequently seen the pain, which had been agonising, subside so unmistakably upon the withdrawal of the quinine, and the substitution of an antacid digestive mixture, that I have no misgivings in jotting down this hint as one to be borne in mind. An useful formula is the following (*Lond. Phar.*):

℞ Potassæ bicarbonatis ʒiss; potassæ nitratis ʒss; tincturæ hyoscyami, spiritus ammoniæ aromat., ā ʒij; ætheris chlorici ʒj; misturæ camph. ad ʒviij. M.

One sixth part to be taken three times a day.

With this, I give compound rhubarb pill at night; regulating the diet, and directing sherry (with water) to be substituted for malt liquor.

The case of hemicrania was a very severe one, resisting for a long time all remedies. It yielded at last, however, to arsenic and cod-liver oil.

The sciatica cases were also severe in character, and somewhat obstinate. In them, I certainly saw great benefit accrue from the purgative formula of (I believe) Mr. Hancock, of Charing Cross Hospital.

℞ Olei tiglii mʒ; pilulæ colocynth. comp. gr. viij; extract hyoscyami, pilulæ hydrargyri, a gr. iv. M. Make four pills.

Two of these pills are to be given every second or third night, so as to ensure free purgation. This plan of treatment is certainly valuable. Of the direct tonics, provided the stomach be in a condition to receive them, the most efficacious will be found to be the sesquioxide of iron, in drachm doses, with cod-liver oil. I have seen benefit also from the extract of stramonium, in doses of half a grain, increased to one grain, every four hours. Guaiacum sometimes does good; but very frequently it fails. If a syphilitic taint be suspected, the iodide of potassium, with the bichloride of mercury, will be the proper remedies. Large blisters along the course of the nerve often afford much, and permanent, relief; and I have seen the hypodermic injection of a solution of morphia relieve the pain almost instantaneously. The cases giving rise to these notes having been purely functional, I do not here include such as depend upon the pressure of a tumour or a portion of necrosed bone. In forming a diagnosis and prognosis, however, this should not be lost sight of.

3. *Chorea*. The disease next in frequency is chorea. The cases treated as out-patients have not been severe; as the only two aggravated instances were advised to become in-patients, and were admitted as such.

One case only deserves a passing remark, inasmuch as the disease was confined to the muscles of the face and neck, the extremities being unaffected. In this patient, the eyes blinked continually, and the mouth, when opened, was closed with a sudden snapping motion. The head also, at the height of the attack was twitched continually towards either shoulder.

In the treatment of a case of chorea as an out-patient, the great obstacle lies in the difficulty of ensuring a diet sufficiently nutritious, with the additional stimulus of wine. These are remedial adjuncts of such importance, that it is thought by some practitioners that, with a nutritious diet, with wine, medicine, if necessary at all, plays but a very secondary part in the treatment. I have been so well satisfied with the result obtained from arsenic, that I have entirely depended upon Fowler's solution in the treatment, provided merely that the digestive

organs be not disordered, nor the bowels much confined. Occasionally a blister to the nape of the neck will be found of signal service.

4. *Epilepsy*. The cases of epilepsy that have presented in the last two years among our out-patients have been fewer in number than have obtained in previous years. Two of these cases have been functional only, depending upon the period of puberty in both sexes.

In the treatment, if the attack be slight, I have been satisfied with the application of a blister to the nape of the neck. If, on the contrary, the disease be of a severe character, and the fits of frequent occurrence, I believe that no remedy acts with such good prospect of success as a seton at the same spot.

Of medicines given internally, I think that I have seen decided benefit follow the use of the bromide of potassium, in doses of five grains, increased, if necessary, to ten grains, three times a day. With this may be combined the ammoniated tincture of valerian. Steel, zinc, and arsenic, in the milder cases, are also valuable remedies. The beneficial effect of nitrate of silver has, I think, been much overrated. It must be borne in mind, however, that, in uncomplicated epilepsy, every new remedy for a time appears to do good.

The diet should be nutritious, with wine rather than malt liquor; and all over-fatigue, with mental excitement, strictly prohibited.

[To be continued.]

ILLUSTRATIONS OF THE DIFFERENT FORMS OF INSANITY.

By W. H. O. SANKEY, M.D.Lond., Proprietor of Sandywell Park Private Asylum; Lecturer on Mental Disease in University College, London; late Medical Superintendent of the Female Department, Hanwell Asylum.

THE course of these papers having been unavoidably interrupted, it becomes necessary to recapitulate the argument which the illustrations were intended to support. In the first papers, Melancholy was described; first, in its most simple form; next, with intellectual disturbance; then, with prominent motor symptoms—that is, in some cases with restless activity of motion, in others with a fixed and semicataleptic inactivity. After that, cases of Mania were given; and it was shown that, as a rule, all cases of acute mania commence with a melancholic stage—that the states of melancholy and mania run imperceptibly together, so that there is no evidence of any pathological difference between these different forms of insanity.

That a stage of melancholy ushers in a very large proportion of all cases of insanity is beyond question. It is the commencement as well as the chief portion of those attacks, to which the name of Melancholia is given; and we have seen that it also ushers in typical cases of mania. That every variety of mental disease has a primary melancholic stage has been doubted and denied. The question is an important one on many accounts; and therefore I have analysed all the new cases that came under my observation during the year 1863 at Hanwell, excepting the cases of general paralysis, epilepsy, and idiocy. I find that there were 198 admissions; and of these 32 belonged to some form of mania. The history of the disease was complete, however, in only 18 of these 32; and there was a distinct and well marked premonitory stage of melancholy in 13, and none in 5 only.

These five cases, without a melancholic stage pre-

coding the evidences of mania, resembled each other in many other points. 1. None of them were primary attacks of insanity. Hence we may draw this inference, which is corroborated by all my experience, that all primary attacks of mania (proper) commence by melancholy; and the converse—viz., that where an outbreak of maniacal violence takes place in an individual without a previous stage of melancholia, such individual has been insane before. 2. These five exceptional cases commenced suddenly. 3. They exhibited great violence for a short period. 4. All recovered; and on recovery all denied having been ill, and dwelt much on the injustice of their detention or incarceration. 5. It is curious—but whether it is an accidental coincidence or not I am uncertain—that three out of the five (and these were all females) stripped themselves naked when first taken.

These cases certainly have characters of sufficient constancy and distinctness to enable us to predicate their future progress; I am not convinced, however, that they constitute in themselves a separate form of disease, or a distinct species.

I know of nothing which marks their character—for example, in the first onset, or in the primary attack. I am not aware of any diagnostic mark which would enable one who witnessed the primary attack to prognosticate that the patient would be liable to repeated secondary attacks of the disease. Nor does my experience enable me to say whether the primary attack is invariably accompanied or not accompanied by melancholic symptoms. This is a point which remains for future inquiry.

If we admit this form of case as distinct, it is nearly the only one out of the multitude of variations which have received distinctive appellations to which I would yield the same distinction.

In different authors, one meets with an almost innumerable variety of forms of insanity, on which separate names have been bestowed. The confusion thus introduced into the subject becomes perplexing in the extreme. Guislain thus commences his ninth chapter: “Vingt-trois formes de manie, sans compter plusieurs formes composées non indiquées, voilà, me direz-vous peut-être, un bagage symptomatologique passablement lourd pour la mémoire.” (P. 203.) Before proceeding with the illustrations of distinct forms, it becomes necessary here to explain of what these so-called varieties consist. From a careful examination of all these variously named kinds of mania, I think it will be found that they belong to one of the three following classes.

1. Certain so-called forms will be found to consist of cases in which one particular symptom has been perhaps rather more prominent than the rest; as, for example, cases named kleptomania, erotomania, nymphomania, oinomania, homicidal, suicidal mania, etc.

2. Another large section of these varieties are named from some presumed cause of attack, such as puerperal mania, hysterical mania, phthisical mania, mania a potu, none of which have very distinctive characters, according to my experience.

3. Varieties have been formed out of what really are only stages in the progress of insanity. The cases hitherto narrated have all belonged to the acute stage of the disease. The morbid processes, in entering upon the chronic stage, undergo certain modifications in their downward progress. The disease may subside gradually, or it may alternate between activity and inactivity; and it may ultimately cease altogether, but leave the mind in one case enfeebled only, in another nearly annihilated. Out of these progressive stages, more kinds of insanity have been formed.

1. In the worst condition, the patient is demented—imbecility, dementia.

2. In another set of cases, the morbid process appears to terminate, but leaves the mind permanently changed in some peculiar function; as a particular delusion remains, an alteration of disposition, or an eccentricity in habits, etc. Most English writers would call this a state of chronic mania. In France, it constitutes what they call monomania; and some writers have coined names for almost every sort of eccentricity of conduct or behaviour met with. “There is a mania,” writes Guislain, “which I call *manie astucieuse, malicieuse*, which resembles this foregoing (*manie raisonnée*), but which presents phenomena of marked character. The patient is guided by a spirit of intrigue; he is a cheat, a sharper, an intriguer,” etc.

3. The downward progress in certain cases is not uniformly progressive. The patient, on the whole, declines towards dementia; but periods of activity—flickerings of the morbid process—occur. Thus the chronic mania may be subject to occasional outbreaks of violence—to a recurrence of the acute symptoms generally; and these attacks take place at completely irregular or at more or less regular intervals. We have the following modes in which this may take place.

1. The patient is subject to occasional outbreaks of violence and excitement; but a constant and progressive increase of imbecility goes on.

2. The patient's condition alternates between a state of general depression and one of great excitement. (This form is called *folie circulaire* by French writers.)

3. The patient has repeated attacks, of two or three months' duration every year, for many years consecutively; not entirely recovering sanity in the interval, but free from depression. These cases are what have already been alluded to as recurrent mania.

In the next paper, a few observations on these variations of the symptoms will be considered.

NOTE ON LARYNGOSCOPY.

By GEORGE JOHNSON, M.D., Professor of Medicine in King's College.

It is common to meet with persons who, having had no experience in the use of the laryngoscope, are sceptical as to the possibility of examining the larynx without difficulty, and, in particular, without occasioning considerable annoyance to the subject of the examination. In illustration of the facility with which, in the great majority of cases, the larynx may be inspected, I beg to narrate the following occurrence.

A few days since, after lecturing to my class at King's College on the Use of the Laryngoscope, I announced to them my intention of first showing them my own larynx, by the simple process which I have described in my published lectures, and then I requested that twelve of my pupils would submit to a laryngoscopic examination, with a view to ascertain in what proportion of cases the larynx could be inspected without difficulty.

Accordingly, twelve gentlemen presented themselves; and the result was, that in eleven cases I at once got a complete view of the larynx by a single introduction of the mirror; while in the twelfth case a large and rather nervous tongue somewhat interfered with the examination, and, after three or four attempts, I got only an incomplete view of the larynx.

The whole process of demonstrating my own larynx, and inspecting the larynx of twelve members of my

class, occupied exactly a quarter of an hour. I believe that not one of these gentlemen had ever before been subjected to a laryngoscopic examination. The ease with which the inspection was borne by the subjects of it was not, therefore, the result of habit on their part.

I thought that this mode of proceeding would be an effectual means of showing my pupils that a laryngoscopic examination may usually be made quickly and with ease; and I think that the publication of the result may influence some sceptics who may chance to read the account. To guard myself against a possible imputation of having made an unwarrantable "assumption", requiring to be exposed and corrected in a second edition of *Medical Errors*, I beg to state that I by no means infer from this experiment that an inspection of the larynx may always be made with equal ease in the same proportion of cases.

Reviews and Notices.

ACUPRESSURE: A New Method of Arresting Surgical Hæmorrhage and of Accelerating the Healing of Wounds. By JAMES Y. SIMPSON, M.D., F.R.S.E., Professor of Medicine and Midwifery in the University of Edinburgh, etc. With Illustrations. Pp. 580. Edinburgh: 1864.

A LITTLE more than five years ago, Dr. SIMPSON described to the Royal Society of Edinburgh a plan for the suppression of hæmorrhage by the temporary compression of arteries by means of metal. This method of treatment, to which he gave the name of *acupressure*, has excited much interest among surgeons, and its reception has been watched throughout by the proposer himself, who now, after a silence of years, comes forth with his matured opinions, first in two lectures in the *Medical Times and Gazette*, and then in the expansion of them in the present work.

After a chapter on the Importance of Surgical Hæmorrhage and Surgical Hæmostatics, the author speaks of the Impediments to the Primary Union of Wounds. In the course of his remarks, he traces the readiness of union in vesico-vaginal fistula, ruptured perinæum, and hare-lip, to the absence of arterial ligatures; and, *vice versa*, he holds that, when surgical wounds fail to unite by primary union, it is because ligatures have been employed.

"It is, in short, the absence or the presence of these ligatures tied around the ends of the bleeding arteries, that makes the marked and distinctive difference between wounds likely to heal and wounds not likely to heal by the first intention. But then arises the next question,—Why do the ligatures interfere with the primary adhesion of wounds?"

"Arterial ligatures prevent the primary union of the lips of wounds in two ways—(1.) By acting as extraneous and irritating bodies, and hence as miniature setons; and (2.) By their necessarily producing strangulation and sloughing of every tied artery at the part of deligation." (P. 22.)

He then proceeds to object to ligatures, that they act as foreign and irritating bodies, and that they strangle and slough the artery at the point tied.

Again, Dr. Simpson still more strongly expresses his abhorrence of the arterial ligature, by comparing its use to the placing of minute morsels of dead flesh into the raw cavities or on the sides of surgical wounds.

"For thus, in every wound, surgeons (1) artificially produce and make as many small masses of strangulated, dead, and sloughing tissue, and have (2) as many small irritating seton-threads attached to these masses, as there are vessels tied. Further, they (3) retain these small sloughs, and the long threads which are anchored to them, for five, ten, or more days, in the depths and sides of the wound, whose surfaces they wish to cohere throughout. (4.) Each separate arterial slough inevitably sets up around it an eliminative process of ulceration and suppuration, and every ligature-thread inevitably also excites suppurative irritation along its track. Is it a great marvel then that primary union so seldom occurs in wounds so managed? Would it not, be a greater marvel, if union by the first intention followed oftener under such adverse circumstances?" (Pp. 45-46.)

In the sixth chapter are described Acupressure-Needles, and the means of applying them.

"*First Method of Application* This was the mode which I generally adopted in most of the first acupressure operations. It consists in passing a long needle twice through the flaps or sides of a wound, so as to cross over and compress the mouth of the bleeding artery or its tube, just in the same way as, in fastening a flower in the lapelle of our coat, we cross over and compress the stalk of it with the pin which fixes it, and with this view pass the pin twice through the lapelle. The only portion of the needle which is left exposed internally on the fresh surface of the wound is the small middle portion of it, which bridges over and compresses the arterial tube at its bleeding mouth, or a line or two or more on the cardiac side of it. And if it were a matter of any moment, this part need not always be left bare; for the needle could be often passed a few lines higher up between the vessel and the cut surface, and without emerging on that surface. More or less of both extremities of the needle, viz., its head and point, are exposed externally on the cutaneous surface of the side or flap of the wound. When passing the needle in this method, the surgeon usually places the point of his left forefinger or of his thumb upon the mouth of the bleeding vessel, and with his right hand he introduces the needle from the cutaneous surface, and passes it right through the whole thickness of the flap till its point projects for a couple of lines or so from the surface of the wound, a little to the right side of the tube of the vessel. Then, by forcibly inclining the head of the needle towards his right, he brings the projecting portion of its point firmly down upon the site of the vessel, and, after seeing that it thus quite shuts the artery, he makes it re-enter the flap as near as possible to the left side of the vessel, and pushes on the needle through the flesh till its point comes out again at the cutaneous surface. In this mode we use the cutaneous walls and component substance of the flap as a resisting medium, against which we compress and close the arterial tube. But in some wounds a neighbouring bone or other firm unyielding texture forms the best and readiest point of resistance against which to pin and compress the artery by the acupressure needle. In such cases, the end of the finger at the bleeding point is sometimes necessary to assist the needle in duly pressing it down upon or against the open vessel. In both these modifications of acupressure a thick flap, or a vessel situated deeply, requires a proportionally longer needle; and the amount of pressure upon the artery is easily regulated and increased, when required, by the acuteness of the angle which the needle makes in its passage over the arterial tube. The degree of compression required to shut an artery by acupressure is generally by no means great, especially if care be taken to pass the needle as near as

possible to the arterial tube, and without a layer or layers of elastic tissue intervening between them. This needle can be withdrawn at will, at any hour or time, by pulling at the head of it; which, I have said, is placed externally.

"There are some objections to using such long needles in acupressure when they can be avoided. They are liable to be passed so as to compress the included tissues too strongly; they compress, however slightly, an unnecessary extent of tissue; and, being partly external, they are liable to prove unwieldy and incommodious in putting on dressings, etc., to the wound, provided we do use such applications to it.

"In the method of acupressure which I have described, the long needles are introduced from the cutaneous surface, and their extremities left out *externally*. In the two other methods—the second and third—common sewing needles are used. They are introduced on the raw surface of the wound, and are situated thus altogether *internally*, or between the lips of the wound.

"*Second Method of Application.* A common short sewing needle, threaded with a short piece of iron-wire for the purpose of afterwards retracting and removing it, is dipped down into the soft textures a little to one side of the vessel, then raised up and bridged over the artery, and then finally dipped down again, and thrust into the soft tissues on the other side of the vessel. In bridging over the vessel, care must be taken to press the end of the needle down upon the mouth or tube of the bleeding artery with force sufficient to shut the arterial tube and arrest the hæmorrhage. The end of the finger pushed against the side of the projecting portion of the needle is often required thus to compress and close the vessel adequately, before the tip of it is sent onwards and fixed in the tissues beyond.

"*Third Method of Application.* This method is the one which will probably be most frequently followed. It consists in compressing the vessel between the threaded sewing needle and a duplicature of passive iron thread. Here, as in the method last related, the cutaneous surface is left intact; but the needle is passed *below*, instead of over or above, the artery. The point of the needle is entered a few lines to one side of the vessel, then passed under or below it, and afterwards pushed on, so that the point again emerges a few lines beyond the vessel. The noose or duplicature of wire is next thrown over the point of the needle; then, after being carried across the mouth or site of the vessel, and passed around the eye-end of the needle, it is pulled sufficiently tight to close the vessel; and lastly, it is fixed by making it turn by a half-twist or twist around the stem of the needle. A slight half-twist usually fixes a rigid wire-thread quite perfectly. If the operator prefers, he may keep the two threads of the noose open after they bridge across the artery, and *tie* them below or behind the eye-end of the needle, in the form of a common single or double knot. A common silk thread may be used in the same way. But the tie with any kind of thread takes much longer time than the twist with metallic thread, and certainly is not more efficient. When in either case—whether the twist or tie has been adopted—the operator wishes to remove this simple acupressure apparatus after a period of, say five, twenty, thirty, or more hours, all he has to do in order to withdraw the needle is to pull it out, by dragging at the twisted wire with which it is threaded. The noose of wire-thread is thus at once loosened and liberated, and can be withdrawn. To distinguish easily between the wire-thread passed through the eye of the needle and the duplicature of wire, it is always convenient to mark the former by

having it plaited or twisted, or a knot for the same purpose can be tied on the end of it." (Pp. 53-61.)

As to the time during which the needles should remain applied, further investigation, Dr. Simpson says, is required; but the period varies with the size of the artery, and is comparatively short, ranging from fifty to twenty or thirty and even two hours. The early removal of the needles is contraindicated by the presence of sickness and vomiting, and by pulsation in the artery up to the edge of the wound. In these cases, it is better to err by leaving the needles longer than is actually required, than to remove them too soon, and thus give opportunity for hæmorrhage to occur.

The eighth chapter contains Dr. Simpson's opinions on the Local Requisites for the Primary Union of Wounds. He advocates the use of metallic sutures; and, beyond these, the use of no other dressing whatever. Vesico-vaginal wounds, he believes, heal readily just because we cannot meddle with them and load them with all kinds of applications.

"Even a dressing of charpie and cold water to a recent wound is, perhaps, more hurtful than useful. It busily unmakes what nature is busily making—a crust along the edges of the closed wound. If the lips of it threaten to become red and irritated or inflamed, then we may apply to them cold water, or still better, cold air. I have found that occasional streams of cold air directed upon the wound or its vicinity from a pair of bellows prove both most beneficial locally, in keeping down morbid heat and irritation, and are most grateful to the feelings of the patient. When the surface of the wound is thus left uncovered, we have an opportunity of at once ascertaining the accession of redness or swelling in any part of it, and of relaxing or snipping any particular suture-thread that may be offering to produce traction or irritation. We can do this without putting the patients to the annoyance and pain of forcibly lifting or raising the dressings from the site of the recent and tender wound—entangled, as these dressings are always apt to be, with the ends of the ligature-threads, and with dried discharges gluing them to the newly cut surface. This absence of all coverings further frees their thoughts from the dread of the renewal and changing of the dressings themselves from time to time—a source of terror of which some patients, as M. Velpeau correctly observes, are almost as afraid as they are of the operation itself. The abandonment of all dressings whatever saves the patient, I repeat, alike from any sufferings and from any fears attached to the removal of them." (Pp. 117-118.)

In the ninth chapter, Dr. Simpson gives a Retrospective Notice of the Primary Local Dressing of Wounds, relating the well known tale of the alarm of Ambroise Paré at his supply of hot oil being exhausted, and his astonishment at finding that the wounded to whom he had applied a more simple dressing were in much the best condition. The author also notices the great changes which have taken place in the treatment of amputation-wounds during the last century in this country, and specially mentions "two of the most able and enlightened provincial surgeons of England"—Mr. Teale of Leeds and Dr. Humphry of Cambridge—as having warmly testified to the superiority of the practice of closing wounds with appropriate sutures, and, beyond this, using no applications.

Some objections against acupressure are now considered. First, is it more difficult than deligation?

Deligation itself, says Dr. Simpson, was once a difficult process in comparison with cauterisation; but now it has become simplified and much more easy. In like manner, "other and simpler means of applying the acupressure-needle than any which I have proposed will very probably be suggested by others." Even at present, however, most surgeons who have tried acupressure, according to the author, have found it as easy as ligature.

Is secondary hæmorrhage more liable to occur with acupressure or with deligation? Not with acupressure, says Dr. Simpson; because, as numerous surgeons write, secondary hæmorrhage depends in the large majority of cases on local causes—ulceration and sloughing; and these, unavoidable after ligature, do not occur when acupressure is used.

"It is when one or other, or both, of these processes proceed to a morbid excess and depth, that secondary hæmorrhage from the opened arterial tube follows. In acupressure, on the other hand, there is no ulceration or sloughing whatsoever of the arterial tube; its cavity becomes obliterated after merely laying its internal surfaces in contact by the pressure of the needle. And hence, secondary hæmorrhage as the result of its two common causes—viz., ulceration and sloughing—should be almost or altogether unknown when acupressure is resorted to." (P. 158.)

Acupressure has been followed by secondary hæmorrhage in two cases; one which occurred in the practice of Mr. Page of Carlisle, where, in amputation of the thigh, the needle was withdrawn in twenty-four hours—probably too soon; and another related by Mr. Crompton, where the formation of a plug in the artery was probably delayed by constitutional causes.

In the fifteenth chapter, Dr. Simpson examines and replies to further objections against acupressure, urged by several of our most eminent surgeons. It was stated by Professor Miller (when Dr. Simpson first brought forward the subject) that it would be difficult to avoid including the vein, and probably also the nerve. To this Dr. Simpson now answers, that acupressure has now been used in many operations without any evil consequences, such as were referred to by Mr. Miller, being induced.

The next statement referred to is that of Mr. Erichsen, who admits that acupressure is "unquestionably safe as well as convenient" for small arteries, but urges that the safety of its application to large arteries remains to be shown. Dr. Simpson replies:

"Already, however, acupressure has been repeatedly employed in stopping hæmorrhage from the largest vessels ever opened in wounds, and that as readily, and as successfully, as from the smallest bleeding arteries. It has been used repeatedly in all the larger amputations. I know of upwards of a dozen cases of amputation of the thigh in which the femoral and all the other arteries of the stump were simply, easily, and successfully secured by acupressure." (Pp. 252-253.)

Another objection is one started by Dr. Neudörfer of Prague, that acupressure can be employed in amputation-wounds only. Dr. Simpson thinks that Dr. Neudörfer can only have seen an imperfect notice of the process, and has hence misunderstood it.

To the objection that a great number of needles may be sometimes required, for the same reason that

a large number of ligatures is demanded, Dr. Simpson replies, that the application of a great number of ligatures is the worse evil of the two. If twenty or more needles were ever requisite, "their use would be followed by no such unfortunate local lesions as the ligatures inevitably produce." He hopes, however, that at some time "one acupressure-needle may perform the function of many ligature-threads", by being applied half an inch or an inch or more above the proposed line of the wound.

Another objection, urged by Mr. Spence, is the frequency of necrosis of the stump after amputation; in consequence of which, too early closure of the wound is not advisable. Dr. Simpson thinks that Mr. Spence overrates the frequency of the occurrence of necrosis.

Mr. Fergusson has expressed an opinion that the tracks of the ligature are useful as vents for pus; and that acupressure may heal wounds too rapidly, and lead the patient to use the limb too soon. Dr. Simpson replies as follows.

"I incline to believe that one great and undoubted source of the suppurations in the interior of wounds is the very presence of the ligatures and of the sloughs and irritation which they produce; and if primary adhesions were far more directly and distinctly aimed at, the formation of any considerable amount of pus would be a far more rare occurrence. In short, it is better, I am inclined to argue, to avoid having foreign bodies, as ligatures, left in the wound, and capable of producing pus, in order, as far as possible, to avoid the formation of pus, rather than lead the pus off by these foreign bodies after it is once formed. By their presence they tend to create the pus as well as evacuate it; but in surgery, as in other practical sciences, the principle of prevention is recognised as infinitely superior to the principle of cure." (P. 263.)

"If the mere speed with which a wound was completely healed were any objection to the method by which that speed was accomplished, it would be a strange paradox in professional ethics. It would be an argument, at all events, that no patient could appreciate or approve of; for it would be difficult, I opine, to persuade him that his wounds should heal slowly under a chronic application of local disturbances, dressings, and discharges, rather than heal swiftly and kindly without any long continuation of pain, or vexation, or trouble whatever. The cure of a surgical wound, as much as the infliction of it, ought always surely to be accomplished, as Celsus writes it, '*tuto*;' but also as surely, wherever it is practicable, '*cito et jucunde*.'" (Pp. 264-265.)

Dr. Simpson then makes elaborate replies to some objections raised by Mr. Syme, who has stated that the ligature is not hurtful but useful in the healing of wounds; that torsion is a sufficient substitute for ligature; and that acupressure is only very limited in its action.

The sixteenth chapter contains notices of cases in which acupressure was employed successfully after ligature had failed or could not be applied.

In the seventeenth chapter, the author describes the arrest of arterial circulation by *Filo-pressure*, or compression by means of thread. The process is an old one, having been noticed by Marianus Sanctus in 1543. Dr. Simpson speaks of the suggestions made by Ferri, Paré, Guillemeau, Dionis, Antoine Louis, Lowe, Wiseman, O'Halloran, etc.; and observes:

"In the preceding retrospect we have found a series of stages of advance in the use and application of the

thread-compress—(1.) Santi applied the compress, tying the knot upon the unprotected skin; (2.) Ferri introduced the use of the bolster or cushion to tie threads upon; (3.) These authors used a thread-compress in common incised wounds, but Paré applied it to amputation wounds; (4.) Up to the time of Dionis the thread was introduced by the use of one long needle, which was passed twice in order to surround the vessel—namely, first from without inwards, and then from within outwards; but Dionis expedited the process by using two needles—applying one to each end of the thread, and passing both from the internal surface of the wound to the cutaneous surface of the flap.

“When studying in 1859 the effects of the circular ligature of vessels now commonly used by surgeons, and considering the means by which it was possible to avoid strangulating and sloughing the tied point of the artery, I had repeatedly occasion to look at the action and effects of the thread-compress as described by Paré, Dionis, and others. But I was led to believe that it had been found objectionable in practice from its having fallen into entire disuse, and I spoke only of acupressure in my first communication on this subject to the Royal Society of Edinburgh in December 1859. Within a few weeks after that communication was published, Mr. Hilliard, an ingenious instrument maker of Glasgow—evidently unaware of all previous writings in the matter—sent me a model and explanation of the thread-compress by which the plan of Dionis—as consisting of the simultaneous use of two needles—was exactly followed—being modified only by the substitution of a thread of iron-wire instead of a thread of hemp or silk. The mere material, of course, of which the thread is made may modify the safety of the operation, but it does not alter the character of the operation itself. Some months afterwards, Mr. Dix of Hull, to whom Mr. Hilliard had also sent his model and proposal, put the plan in practice in three cases of amputation of the finger, foot, and thigh, in a case of removal of the testicle, and in another of removal of the mamma; and, in January 1863, he read before the Medico-Chirurgical Society of London, a very ingenious and able paper on the subject, which has been published in the *Edinburgh Medical Journal* for September 1864.” (Pp. 333-336.)

The thread-compress has also been used by Langenbeck, and recently by Neudörfer, who appears to have independently devised precisely the same procedure as that of Mr. Dix.

In succeeding chapters, Dr. Simpson comments on Surgical Fever and its causes, and its greater liability to occur after ligature than after acupressure; and describes various applications of acupressure. Among them, he suggests the use of acupressure to aneurism, and to the ovarian pedicle in ovariectomy. There is also an appendix of much interesting matter.

Dr. Simpson is a man to whom nothing seems to come amiss. Known throughout the civilised world as an obstetrician of the first rank, and as the discoverer of the anæsthetic properties of chloroform, he extends his inquiries not only into other departments of his profession—surgery especially—but even beyond. He has a name as a learned antiquarian. Very much of what we know of the medical service of the Roman armies is due to him; and we have seen some elaborate antiquarian—non-professional—essays, his productions. In this book, too, the spirit of research into old things appears; with the effect of showing what is due to the old surgeons. We will give a few interesting extracts, which may at least

remind our readers of what our forefathers used to think good surgery. Let us take first a description of an old plan of removing the breast.

“Very many of the old and mediæval surgeons, without recommending the rush of blood following each new individual gash of the knife to be arrested by a new application of the red-hot cautery-irons, effected first the complete excision of the diseased organ, and then subsequently applied their canteries, caustics, or other hæmostatics, to the extensive resulting bleeding surface, till the hæmorrhage was stanch and restrained.

“The diseased mamma, under this plan of treatment, was entirely sliced off by one or two huge and rapid incisions through its base. Ere the simple grasp of the hand was mainly trusted to, various ingeniously merciless devices were employed to hold the diseased mass steady and outstretched whilst the stroke for this swift and rough process of amputation was inflicted. For this purpose, one of the oldest methods followed consisted, as represented in the plates of Scultetus and Heister, in transfixing the breast with two threads or cords introduced crosswise to each other; a plan described and praised also by Nuck. The diseased part was pulled outwards by traction upon these cords, and then the wholesale extirpation of the entire mamma—gland, skin, and all—was effected by cutting behind the cords or through the base of the tumour. To lift and hold out the breast, Solingen and Bidlow transfixed it with a large strong fork, the prongs of which were seven or eight inches in length. Bidlow, in smaller cancers, employed for the same object a flattened sharp-pointed instrument, which Heister correctly compares to a small sword, effecting with it the transfixion and elevation of the mass. For the same purpose Helvetius contrived great pincers, the sharpened beaks of which were ruthlessly dug into the sides of the mammary mass to hook and hold it up; and this instrument of Helvetius was long in fashion and much employed and lauded by European surgeons. Tabor, Hartmann, and Vylhoorn, used for the purpose a special instrument or machine, which was intended for the double function of both fixing and slicing off the breast. It consisted of a jointed circlet of iron made so as to close and tighten upon the basis of the mamma that was to be removed; and then subsequently a knife, of the shape of a sickle or half-circle, by a strong and swift motion of the handle shaved off the whole diseased mass.” (Pp. 220-223.)

Here, again, is the treatment of stumps, as described not a century ago by Mr. Bromfeild, surgeon to St. George's Hospital, and to the Queen.

“He recommends some twelve or more different series of applications to be laid upon it at its primary dressing; namely, 1, dry lint on the bone; 2, a circular piece of old holland to lie within the skin of the stump, or on the cut muscles; 3, dry lint applied on the outside of this piece of linen to fill up the cavities in the stump; 4, a little flour on this bit of cloth; or on, 5th, another superimposed layer of lint, which may also be assisted in its compression by applying—6, a soft bolster of tow on the lint; 7, small pledgets of digestive ointment spread on lint, and applied to the edges of the stump; 8, a large general pledget of digestive ointment, or lint; 9, a compress of tow; 10, straps of leather and cloth spread with adhesive plaster, and crossed over the end of the stump like the rays of a star at its centre, and kept in their places by passing—11, a slip of sticking-plaster, spread on leather, round the whole stump, so as to prevent any of the points getting loose; 12, the usual amputation cap of Fabricius Hildanus drawn over

the stump so as to envelope it, and secured by—13, a roller wound over it from the end of the stump loosely upwards, with strings sewed to the cap, and fastened round the body." (Pp. 126-128.)

Such were the old abuses, which modern light has dispelled; and Dr. Simpson, seeing still further need of improvement, raises his voice against the persistence in treatment which he believes to be injurious. As a rational reformer, however, he proposes a substitute for that which he denounces; and this substitute he defends with energy and ability against all comers. This must be borne in mind in reading Dr. Simpson's work, that he writes as a partisan—for one system, and against another; and hence, while we accept the book as the expression of his honest and carefully matured opinion, we must make all allowance for the parental affection which Dr. Simpson must naturally be expected to feel towards his own offspring. The profession is now in possession of what Dr. Simpson has to say on acupressure; he has laid his plan before surgeons; and it is for them to test it fairly, and to adopt, modify, or reject it. We would suggest a careful inquiry into the relative merits of the needle and the ligature. Our hospital surgeons throughout the country, and the Royal Medical and Chirurgical Society, might well take the subject up, and endeavour to determine by experiments *in corpore vili*, as well as in operations on man, whether acupressure really fulfils all that has been said of it by its proposer. Whatever be the result, the gratitude of the profession will be equally due to Dr. Simpson for his attempt to introduce an important improvement into the practice of surgery.

PRACTICAL DIETARY FOR FAMILIES, SCHOOLS, AND THE LABOURING CLASSES. By EDWARD SMITH, M.D., LL.B., F.R.S., etc. Pp. 265. London: 1864.

THE popular laudations of Bantingism, Turkish baths, hydropathic wet sheet and water-drenching establishments, and some other like "perfect cures", are, when reduced to their simplest expression, the thanksgiving of gluttony. People eat and drink more than their belly and its members can dispose of; and thereupon, in the due course of things, naturally and properly fall sick—"out of sorts". They can neither eat nor drink with their former degree of contentment, and are angry with the stomach because it is rebellious at being oppressed with work. But eating and drinking are, with the sort of persons we are speaking of, a great business—one of the most important. To be deprived of the privilege and power of "dining" would be fatal to their happiness—would, in fact, be to them a loss of one of the most essential purposes or objects of existence. When, therefore, the *gourmet* has arrived at such a pass; if he cannot dine with satisfaction; if he become painfully obese; if his liver enlarge, and his legs swell; if his breathing be short; if gout attack his joints excruciatingly; and if other of the luxurious evils attendant upon "good living" fall upon him,—he naturally looks around for relief from his woes; and he requires a peculiar relief. It must be of a kind which shall allow him quickly to return to his happiness—give him back his stomach. Let his doctor, for example, recommend to him the virtue of abstinence as his rational cure, and very certainly he will

never trouble that doctor for advice again. But let his doctor purge him well—Abernethy him with blue pill and black draught—for a few days; disgorge his liver of bile; eliminate lithates, etc., with his urine; and give him a clean tongue and mouth—in fact, an appetite to start afresh with; and he will suit his patient, and have him again. But purging at last becomes irksome, and, what is more, ceases in the end to have its usual effects; and then the *gourmet* has to cast about for further help, but of the same sort—viz., that which shall enable him *revenir à ses moutons*—to go back to his table with a satisfactory stomach. And, consequently, there spring up for his services Herr Preissnitz and his plenaqueous brethren. Under their direction, our *gourmet* will, for the promissory note of a future stomach given him, put a check on his appetite; live for weeks on bread, and beef, and water; breathe fresh mountain-air; take good walking exercise—in fact, eat and drink like a reasonable creature. All this restraint he freely and hopefully undergoes for the time; and then returns to the city, lauds the water-cure to the skies, and abuses the doctors!

The Turkish Bath is another refuge for the glutton. By exciting an excessive action of the skin, this pleasant and luxurious remedy enables him, at all events for a time, to counteract the material evils of gluttony. Instead of blue pill, he takes a sweating. What a capital thing! It makes one light as a bird. What an appetite it gives one! But even the Turkish Bath is not an immortal remedy for gluttony; its virtues, like that of all unnatural operations, must come to an end. An over-stimulated skin cannot be flogged into extra action beyond a certain point. And so our poor *gourmet* is again thrown on his beam-ends.

Thanks to the shade of Daniel Lambert, then comes panting to his aid the immortal Banting—last in the field of diet-teachers, and yet the most esteemed! "Listen to me," says he. "I neither purge you, nor sweat you, nor ask you to drink water and eat dry mutton, nor swelter in cold sheets, nor live in the outer regions of civilisation; but I will let you have capital eating and drinking, and, in truth, make your indulgence of your stomach your very means of cure. A fine and elegant, but carefully selected *cuisine*, shall be your remedy." Need we say that the men of fat and feeding fall down and worship and believe in Banting and his golden calving for the appetite?

Then there is another sort of human beings, and they also suffer through their stomachs; and, unfortunately, they are a much larger class than the one we have been speaking of. They suffer, not through a surplus, but from a deficit, of food; or suffer from an ill-chosen regimen; and it is with this class that Dr. SMITH has to deal. His work, he says, "is intended to be a guide to heads of families and schools in their efforts to properly nourish themselves and those committed to their care; and also to clergymen and philanthropists who take an interest in the welfare of our labouring population."

That such a book is wanted, every medical man knows well. The mischief done, the seeds of disease laid, through ignorance in proper feeding, is very great in schools, and especially in female schools. The bad management of infants is also a well known fact.

In the first part of the work, Dr. Smith treats of the Elements of Food required by the Body, and the Qualities of Foods. In the second part, the Dietary of Families, of Schools, of the Labouring Classes, is detailed at length. The last two chapters, upon the Dietary of the Labouring Classes, are of particular value. They show how the labourer may turn his money to the best advantage—how he may extract from his hard-earned wages the greatest amount of nutritive materials.

Though written mainly for non-professional readers, the book has an exact and philosophic style; and certainly no person in the kingdom is more entitled to write upon the subject of diet than Dr. Smith is. We will venture to prophesy that the book will find as great favour within as outside the profession; and for the reason, that it contains a very large amount of information which the medical man requires to know, and gives the information in a concise and philosophic form.

Progress of Medical Science.

MEDICINE.

POISONING BY THE ENDERMIC USE OF ATROPINE. Dr. H. Ploss of Leipsic relates the following case. A man, aged 33, had an affection of the larynx, which Dr. Ploss regarded as being of a syphilitic nature. Another physician, however, being called in consultation, decided that the case was one of simple laryngitis, and ordered a blister to be applied round the neck, to be dressed on the following day with an ointment composed of 15 parts of sulphate of atropine to 700 of lard. Dr. Ploss expressed his fears as to the effects of this; but his remonstrances were not attended to. Some minutes after the application of the ointment, the patient suddenly sprang from his seat, in a state of indescribable anguish; he ran about the room, crying out that he was suffocated, that everything appeared black before his eyes, and that he felt as if he were being strangled. He violently tore off the dressing; and threw himself on his couch, his eyes fixed and his face fiery red. Dysphagia and dyspnoea increased more and more; clonic convulsions of the limbs set in, resembling those of chorea; the breathing became very frequent; the pulse rose to 140 or 150; the patient could not utter a word. An attempt was made to bleed him; but this could not be done on account of the constant convulsive movements. It was equally impossible to introduce anything by the mouth or by the rectum. The breathing soon became interrupted, the pulse thready, and the patient died, scarcely two hours after the application of the ointment. (*Zeitschr. für Med., Chir., und Geburtsh.*; and *Gaz. Méd. de Paris*, 22 Octobre, 1864.)

ETHER AS AN ANTHELMINTIC. M. Lortet, in a paper read before the Société des Sciences Médicales at Lyons, proposes to destroy tapeworms by anaesthesia. He was, he says, one day assisting the late M. Bertolus in an experiment on a dog; when, the animal having been asphyxiated by the ether vapour, a mass of tanie rolled together were found in the lower part of the rectum. On being placed in water, at about 104° Fahr., they revived and swam about. This experiment has been several times repeated by M. Lortet, always with the same result; and he has, therefore, been induced to use ether as an anthelmintic in man. He has given it in five cases; and

in all the tænia has been passed without pain, entire or nearly so, and always with the cephalic end uninjured. The dose of ether is sixty grammes (about two ounces), in capsules or mixed with syrup, followed in two hours by an ounce of castor-oil. (*Gaz. Méd. de Lyon*, 1 Janvier, 1865.)

TARTARISED ANTIMONY IN URÆMIA. Dr. Lange of Königsberg recommends the use of tartar emetic in uræmia, especially that following acute exanthematous diseases. For adults, thirty centigrammes are dissolved in 150 grammes of water, and a teaspoonful is given every quarter or half-hour. This treatment appears to have been successful in three cases out of five. One was a weakly child, who had considerable anasarca and ascites, the result of acute nephritis; another was a strong woman, aged 23, who was suddenly seized, during scarlatina, with convulsions, coma, and other symptoms of uræmic poisoning. (*Presse Méd. Belge*; and *Bull. Génér. de Thér.*, 30 Dec., 1864.)

TRAUMATIC TETANUS TREATED BY OPIUM, BELLADONNA, AND CHLOROFORM: RECOVERY. A strong young man was admitted into the hospital at Poitiers, with a deep contused wound of the left hand produced by a pistol charged with powder and wadding only. The wound was almost healed on the sixth day, when the patient was seized (November 26) with trismus. Rest was ordered, and syrup of belladonna was given every two hours. On November 29, the trismus had not increased, but there was some stiffness of the dorsal and abdominal muscles. Anaesthesia was produced by chloroform twice on this day; and three times on the following. There was still much rigidity of the muscles of the trunk, and also constriction of the pharynx and consequent dysphagia. On December 2, chloroform was again given three times. On each occasion on which anaesthesia was produced, it was followed by abundant sweating, and the pulse fell from 70 or 80 to 45, and even 40. On December 3, the jaws were almost free. An opium pill was given every two or three hours, and the chloroform was continued. On the 9th, the patient had a febrile paroxysm in the evening, and eight grains of sulphate of quinine were given. The rigidity of the abdominal muscles did not completely cease until the 28th December, the treatment already described having been continued throughout. (*Journ. de Méd. de Poitiers*, and *Bull. Génér. de Thér.*, 30 Decembre, 1864.) In this case, as the reporter in the *Bulletin* remarks, it is difficult to say to which of the remedies employed the recovery was due. The occasional assumption by tetanus of a chronic form, and the consequent greater probability of the patient's recovery, must also not be forgotten.

LEAD-COLIC TREATED BY SULPHUR. M. Guibout of the Hospital Saint Louis, had recently two cases of lead-colic, in which he administered the usual remedies without success. He then gave them sulphur in daily doses of sixteen grammes, to be taken in honey or water. Both patients recovered. M. Guibout promised to make further experiments, and lay the result before the Academy of Medicine. (*Bull. Génér. de Thér.*, 15 Decembre, 1864.)

PATHOLOGICAL COMPLICATIONS OF CHRONIC RHEUMATISM. According to M. Cornil, chronic rheumatism, as well as acute, may be complicated with disease of internal organs. He sums up a long memoir as follows:—1. Diseases of the heart, especially acute or chronic pericarditis, may be met with in cases of chronic articular rheumatism; and, if their occurrence has not hitherto been generally recognised, it is be-

cause of the difficulty of diagnosing them during life. 2. Diseases of the urinary organs—cystitis, pyelonephritis, and consequent atrophy of the parenchyma of the kidneys—are frequent enough in the course of this disease. 3. In some cases, there may be chronic albuminous nephritis. 4. In almost all cases, at an advanced period of the disease, there is dyspepsia, characterised by want of appetite, vomiting, and diarrhoea. 5. There is produced a peculiar cachexia which favours the production of gangrenous eschars and extensive suppuration, with loss of skin. (*Gazette Méd. de Paris*, No. 39, 1864.)

SYPHILITIC PULMONARY DISEASE TREATED BY IODIDE OF POTASSIUM. To the observations which have been made in recent years on the syphilitic affections of internal organs, Dr. Aynard adds the following. A man aged 27 had in 1861 a chancre on the penis, which was slow in healing and was accompanied by a bubo in the left groin, which ulcerated after a long time. The patient then had abundant discharge from the inguinal region, a copious pustular eruption on the lower limbs and on the scalp; the uvula was destroyed, the tonsils were injured, and the right testicle, having enlarged and suppurated, was obliged to be removed by the *écraseur*. He was also seized with frequent cough and hæmoptysis. Dr. Aynard, on seeing him, found that he had an icteric tint, extreme emaciation, profuse night-sweats, diarrhoea, constant cough, and hæmoptysis. There was a hollow sound on percussion beneath the right clavicle, and strongly marked dullness of the entire posterior and upper part of the left lung: on auscultation there were heard distinct cavernous respiration on the right side and large mucous râles in the left. There were also squamous patches on the hands, ulcerative inflammation about the roots of several nails, and commencing œdema of the feet. Iodide of potassium was given in doses of 15 grammes daily, and a tonic regimen, with quinine and nitrate of silver as external applications were ordered. The patient's state was much improved in the course of a month; and he ultimately made, according to Dr. Aynard, a perfect recovery. (*Journ. de Méd. de Bordeaux*, and *Bull. Génér. de Thé.*, 30 Nov., 1864.)

TREATMENT OF SCABIES. Dr. Metzl recommends the application of phosphuretted oil. This is made by boiling, in a vessel closed by membrane, two drachms of phosphorus in a pint of olive oil, and decanting when cold, so as to separate the undissolved phosphorus. (*Journ. de Méd. de Bruxelles*, and *Gaz. Méd. de Lyon*, 16 Nov., 1864.)

THE USE OF PHENIC ACID IN MEDICINE. M. Déclat, in a memoir read before the Academy of Sciences, dwelt principally upon the action of phenic acid as a local application to sloughing wounds, on which the action of the acid appears to be most remarkable. He also mentioned a case of epithelial cancer of the tongue, in which it appeared to be effecting a perfect cure. As an injection in some affections of the bladder and the genito-urinary organs, it also seemed to produce most beneficial effects. In obstinate eczema and other skin-diseases, a lotion of the acid appeared to be most useful; while, as a general and local disinfectant, it seemed unequalled. Lastly, he mentioned two cases of croup, in which the effects were most striking.

STAVESACRE OINTMENT IN SKIN-DISEASES. At a recent meeting of the Pharmaceutical Society, a paper was read by Mr. Balmanno Squire, on a New Form of Ointment of Stavesacre, and its Application in certain Skin-Diseases. Mr. Squire believed that

prurigo senilis was the consequence of the presence of the common louse, *pediculus corporis*; and that the best thing for getting rid of the parasite and curing the disorder was an ointment of stavesacre. But stavesacre-seeds contain a good deal of oil, and are difficult to powder; and ointment made from the crushed seeds is an inconvenient and inelegant preparation. Mr. Squire had found, however, that the oil expressed from the seeds contains all the active properties; and when mixed with lard and a little white wax, to give consistence, it makes an excellent and useful ointment. A preparation nearly as effective, but not so white, can be made by digesting the crushed seeds in hot lard for some hours, and then straining. This ointment, though not so good as the former, is very useful for itch.

We beg to remind the members of the Association that the annual subscription is now due. Payment of the same can be made either to the Honorary Secretaries of Branches; or to the General Secretary, T. Watkin Williams, Esq., 13, Newhall Street, Birmingham.

British Medical Journal.

SATURDAY, JANUARY 21ST, 1865.

OUR PROFESSIONAL BRETHERN.

THE case of Pryce v. Bowen will become a very important precedent. Never, perhaps, has the voice of the profession been more unanimous in the condemnation of the inconsiderate giving of that kind of medical evidence in law courts, which unjustly injures, or tends to the injuring of, a medical brother. Mr. Lund's explanation will, we fear, hardly satisfy his readers; and he will not be surprised if it do not, inasmuch as he himself confesses a regret that he "touched the case at all." Sincerely do we trust, that this incident will be a warning in the future to any medical man who may be tempted, either by a love of notoriety or a glittering fee, to enter the witness-box against a medical brother, unless the cause be one in which justice and honourable sentiment require his presence there. Far be it from us to preach the doctrine, that a medical man is never to appear in a law court to condemn the doings of a professional brother. There may be occasions when it would be a dishonour not to give evidence against him. What we judge as unpardonable is the conduct of those who, without sufficient knowledge of the facts, or upon a non-professional *ex parte* statement of facts, lend their voice and what influence they possess to the condemnation of the practice of a medical brother. Such conduct is utterly without excuse; for its consequences may be, and are, actually a serious calamity to a professional man, may ruin his reputation, and always heavily tax his purse—and all this, even when it may

be proved in the court that he has done his duty honestly and well, and as a man of science should do it.

Let there be no mistake about the matter. Whoever enters the witness-box as a medical expert, to give evidence against the practice of a medical brother, accepts the responsibility of the prosecution. Without his evidence and countenance, the action could never be brought into a court of law at all. Unless a medical man can be found to back the complaint, the complaint must drop to pieces in the lawyers' hands long before it comes into court. On the prosecuting medical man's head, therefore, must, in the court of professional opinion, rest any injury wrongfully done thereby to a professional brother; and most properly does the profession call such a man before its bar to answer for his conduct.

We may be asked, But how is a medical man to know when he ought to appear in court and condemn a medical brother's practice, and when he should abstain? We answer, that there can be little difficulty in finding a fitting answer to the question, if the man be only disposed to find it. If he seek a solution of the question (as a matter of conscience and duty on his part), he will never seek in vain. And if he owe a duty to his conscience in that way, to protect the interests of the sick, let him remember, also, the duty which is required of him by his conscience towards his professional brother. Let him remember how hard it is to judge fairly of another man's practice or conduct of a particular case, of his treatment of a case; and how impossible it is to do so honestly on the mere strength of non-professional evidence. Let him settle this also with his conscience, that, if he accept a retaining fee, he thereby drags his brother into a law court, gives his countenance to the accusation, and so, indirectly or by implication, admits its truth.

We will venture to affirm, that there never will be the slightest difficulty, wherever there is the will and the wish, in knowing when a medical man should abstain from witnessing against a professional brother's conduct, and when he should honestly enter the box and publicly denounce it. The mere consent on the part of a medical witness to appear in the case supposed against a professional brother, even though his evidence when given be not injurious to him, is, for the reasons here stated, perfectly unjustifiable. All the lawyer wants is the name of a respectable medical man as a witness. Without that name he could not get up his case; with the name he can bring the action into court. And what satisfaction is it, that the medical witness should say, when the trial is over, "Oh! I said nothing against you. My evidence was given on the assumption of certain hypotheses, which have been now shown to be untrue. My evidence has done you no harm."

What retribution is this apology, at the hands of him who has been the means of dragging an honourable and honest practitioner of medicine into a court of law; for having subjected him to the whispers of malevolent tongues; for having thrown suspicion on his capacity or his character; for all the mental anxiety which he has suffered; and for the heavy pecuniary expense with which he has been saddled? The profession has now, through the bold out-spoken proceedings of the medical men of Liverpool, declared that it will accept of no such apology; and it has done well. Whoever accepts the position of prosecuting surgeon in such a case, must accept also the indignation of his professional brethren.

THE DOCTOR A SCAPEGOAT.

THE judgment of the Poor-law authorities on the case of Timothy Daly, whose death was supposed to have been hastened by neglect or bad treatment while he was in the hospital of the Holborn Union workhouse, has not yet been given; nor are we altogether bound to accept that judgment, whatever it may be, when given. As far as we can judge from the case as it stands, this is just another of the instances in which the doctor is made a scapegoat when a too striking example of the hardships—we may say, in some cases, of the cruelties—of the Poor-law system, comes before the public. The Poor-law guardians pay their medical officers shamefully, and they know they do so; and they also know that no work—we mean regular business—ever is or can be done properly, which is not properly paid for.

Now here is the case of a gentleman who has undertaken to do work of a most serious and arduous kind, for remuneration which every one must know to be perfectly inadequate to the amount of work done. The Poor-law guardians of the Holborn Union must be as well aware of this as we are. We find that the salary of Mr. Norton is £100 *per annum*; and that out of it he finds drugs, which cost him, he says, about £20 a year. He has, on an average, 120 patients on his books in the house; and of these, about forty require daily attendance. Consequently, Mr. Norton attends daily forty patients, at the rate of about 4s. 6d. a visit; that is, the guardians pay him about one penny per patient for each visit. For twelve daily visits to Timothy Daly, he would, therefore, have received little more than one shilling!

One of the daily papers has, we are very glad to see, taken this plain matter of fact view of the case, and has thrown upon the shoulders of the system any defect which may have existed in its administration in this particular instance.

"In that one adjective, 'slovenly', lies the whole gist of this Tragedy of Error. From beginning to end the new Poor-law has been worked in a slovenly manner. The demon of slovenliness has sat brooding, like a ghoul on a sepulchre, over every union workhouse in the country. The workhouse pauper is

looked upon as something between a criminal and an object of sympathy, but more of the first than the last. The dietary scale for adult and juvenile paupers was drawn up by the most conspicuous political economists in England. It is low in quantity, but it is sufficient to support nature. In the treatment of the destitute, the sick, and the infirm, this same and most accursed system of slovenliness is to the full as apparent. The infirmaries and sick wards are throughout slovenly. They have no medical status; they are not schools of science, like the hospitals. The doctor is underpaid and overworked; the nurses are ignorant. What are termed 'hospital comforts'—wines, beef-tea, jellies, and the like—are administered either when they are not required, or when they are too late. Far different is it in our hospitals, where the meanest and raggedest are tended and cared for by the wisest and best physicians and surgeons of whom England can boast, and are treated as though they were princes of the blood."

It is painful to think that in this case, again, the first person who threw a stone at Mr. Norton, and exposed him (as we believe, without any just or sufficient cause) to all this painful scrutiny, and to the most cruel and unjust condemnation (before hearing) of a part of the press, was a medical man. It is painful, again, to have watched through this inquiry the arts of the advocate practised against his medical brother by a member of the profession. It is painful also to notice that, in a case manifestly so greatly complicated, medical brethren should have been found who were not willing, apparently, to give their unfortunate brother the benefit of any doubt. If the evidence be correctly reported, some of the medical facts, which were honestly capable of a very different construction, were to our mind most unfairly stretched against Mr. Norton. Let the history of Timothy Daly be briefly considered.

On the 29th of October he was admitted, suffering from acute rheumatic fever, to the Holborn Union. He was in such a weakly state that he had to be helped up the stairs by men, to be placed in the sickward. In this workhouse infirmary he remained more than six weeks; and on December 14th was taken to Union Court, where he lay, tended by a very kind landlady, and assisted by his wife, until the 22nd, when he was removed to St. Bartholomew's Hospital, where he died on December 23rd.

The case supposed against Mr. Norton is, that the man died from bed-sores; and that the bed-sores were the result of his neglect. Happily, however, Dr. Goodfellow, to his very great credit, stepped in here, and proved, we trust to the satisfaction of the Poor-law Commissioners, that in some such cases—and this was manifestly just one of the sort—bed-sores will happen even when the highest art and all appliances are engaged in the attempt to prevent them. Most properly, also, did Dr. Goodfellow lay stress on facts which had been too lightly estimated, not to say unfairly passed over, by others, as aiding causes of death. He referred to the signs of acute pleurisy and cardiac affection.

"When I first read an account of the case of Timothy Daly, I could not avoid coming to the conclusion that some remarks as to the impossibility of bed-sores occurring in the course of acute rheumatism with heart complications, if well and carefully nursed, were unfair to the medical officer of the Holborn Union; that, although unacquainted with that gentleman, I offered to give evidence which would tend to show that even with as good nursing as hospitals usually afford and constant medical supervision bed-sores of a very formidable character will exceptionally, though very rarely, occur. I meant to have adduced two cases that occurred in my own practice at the Middlesex Hospital during the last ten years, in which deep sloughing bed-sores had formed. The subjects of the disease were about the same age as Daly; the rheumatic attack was unusually severe and it was complicated with cardiac disease (pericarditis) and pleuropneumonia. It seemed to me also from a careful reading of the evidence and of the *post mortem* report of Dr. Andrews that the poor man's improvement could not have been so great as was reported after his leaving the infirmary, for in the first place he bore the removal from the workhouse to his lodgings without material suffering, while that from the latter to St. Bartholomew's Hospital in Dr. Andrew's opinion hastened, if did it not immediately cause, his death. In the second place, it appears plain from the *post mortem* report that the pleurisy was of recent date, and without doubt came on after his removal from the workhouse."

Dr. Goodfellow's views of the case seem just and reasonable, and clearly exculpate Mr. Norton from blame in this particular case. To suppose or pretend that patients in workhouses have all the care and attention and comforts that patients in ordinary hospitals have, is to make a gratuitous pretension, which everybody knows to be untrue. If there be a failure, let the workhouse system be called to account. To cast a stone at the medical officer is simply to make a scapegoat of him. At least, his medical brethren should not be the first to cast a stone at him.

The Times, since the above lines were written, entirely endorses our opinion, and has done the *amende* to Mr. Norton by confessing that the blame cannot be placed upon any individual.

"It will, we think, be seen from this review of the case that the matter cannot be fairly settled by laying the blame upon any individuals alone. The evidence leaves an irresistible impression, that though everything may be done fairly well for a workhouse, yet the whole system is scamped in every corner and by every one who has to do with it. Mr. Norton, for example, has on his books an average number of 120 patients, forty of whom require daily attendances; and for this amount of work he is paid by the guardians £100 a year, and out of this sum has to find his own drugs, which amount to £20 a year. No doubt when a man undertakes an office of his own consent, even upon such terms, he is bound to discharge it as thoroughly as if he were amply remunerated; but, as a mere matter of human nature, the guardians must know perfectly well that, if they want the medical duties of the workhouse to be thoroughly performed, they must offer a higher salary. Theoretically the doctor may order as much as he likes, but practically he knows he must keep within limits. Mr. Norton, for instance, says that the guardians have privately inquired of him how he ac-

counted for so much wine being used in the infirmary. Add to this the unpaid nurses and the beds barely long enough, and we have a picture of an administration the main and constant object of which is to spend as little as possible. This it was that was so disastrous in the present case. The patient was in a state in which he required generous and liberal treatment, and he received only a cheap and measured one. Such an instance, and the system which makes it possible, are a disgrace to the administration of our Poor Law; and the Poor-law Board will, we trust, set its face against all similar abuse of the duties of guardians."

THE Council of the Royal College of Surgeons has again refused to do an act of simple justice to the great body of its Fellows. It has been urged a second time by the British Medical Association to take the requisite steps in order to enable all the Fellows of the College—country as well as town—to have a voice in the election of Councillors. At the present moment, the election is virtually in the hands of the London Fellows. Why should it be so? Have not the country Fellows as great an interest in the welfare of the College as the London Fellows? Are they not quite as likely to vote (freed from party feelings and personal likes and dislikes) for the most worthy men? Not to give the country Fellows a vote—for to refuse them the power of voting by papers, is virtually to deprive them of the power—is a declaration that the Fellows are unworthy of, or incapable of, properly exercising the privilege of electing Councillors. Or, we must assume that the Council will not give them the privilege, because of the expenses which would be involved in obtaining the required alteration of the Charter. But has the College come to the pass, that with an enormous income of thousands a year it is unwilling to expend a hundred in doing a great act of justice? We may, at all events, prophesy, that though the Council refuse to do it now, it cannot much longer prudently resist the performance of so plain a duty. The following is the answer returned to the Secretary of our Association by the Council.

Royal College of Surgeons of England, 13th January, 1865.

SIR,—The President has laid before the Council of this College your letter to him of the 19th of September last, together with its accompanying memorial of the 15th of September last, from the President and members of the British Medical Association, again bringing before the notice of the Council of this College "the general dissatisfaction" of the Fellows and members of the College at the mode of electing the Council, and requesting "that the Council will be pleased to obtain a new or supplemental Charter, in order to render it lawful for the election of Councillors to be conducted by means of voting-papers, which may be filled up by non-resident electors, after some such plan as that prescribed for the Universities of Oxford and Cambridge, in their election of members of Parliament."

I am desired to acquaint you, in reply, that the Council of this College, having taken the same into consideration, sees no reason to alter its opinion

upon the subject, as communicated to you on the 24th of November, 1863.

I am, sir, your obedient servant,

EDM. BELFOUR, Secretary.

To T. Watkin Williams, Esq., General Secretary,
British Medical Association.

WE are glad to hear, in the interests of humanity, that Bethlehem Asylum may possibly even yet be removed into the country. It is surely impossible to offer one single solid reason for its retention in the metropolis. But the reasons why it should be placed in the country are too obvious to need any detailing. The only suggestion of a valid kind made for its retention where it is, is that it offers a receptacle always at hand to receive the insane. But this has been answered by the proposal, that a reception-house, or a ward attached to some public institution, should be established in London to receive patients, to be subsequently transmitted into the (proposed) country asylum. Summarily, the advantages of a country residence for lunatics are: diminution of expenses of keep; pure air, which promotes mental as well as bodily health; country walks, quietude, cheerful prospects, and garden occupations—healthful country recreations—benefit disordered minds. In Brussels, there is attached to St. John's Hospital an *annex*, with a small enclosure, where insane patients are received and temporarily treated before they are drafted off to Gheel or some public asylum. And just the same *annex* might be established in London to receive patients for Bethlehem. The manifest wisdom of removing asylums from crowded cities into the country has been practically admitted by most of the capitals of Europe. If Bethlehem do not migrate, London will have to blush that it is the only capital in Europe which retains its public asylums immured in smoke, surrounded by buildings, amidst a dense population; in fact, which treats and keeps its lunatics much as it treats and keeps its prisoners. By removal to the country, a flood of healthy light would be thrown upon this splendid asylum and its very large revenues. And we doubt not, amongst other discoveries made thereby, it would soon be found that its monetary capacity of relieving suffering would be very greatly increased.

DR. T. H. BARKER of Bedford has given, in a paper read before the Social Science Association at York, some very useful hints on the subject of Town and Village Kitchens for Sick Poor Cookery.

"It has often been my lot" (he says) "to regret the bad and inefficient cookery of the poor, in the agricultural district in which I live. In health, their cooking processes are by far too restricted; but in sickness, their ignorance of cookery is truly lamentable. It is difficult to get the commonest articles of diet for the sick-room—such as oatmeal gruel—properly prepared. The plan now suggested is the establishment in towns and villages of well appointed kitchens, under the direction of medical men, for the

supply of suitable food to the sick poor, and to poor lying-in women. These kitchens could be established in connection with: 1. The hospital, the infirmary, or the dispensary, in towns, or with the village hospital, where such already exists; or with—2. Some existing school, institution, or—3. As separate and distinct institutions in towns or villages, on a scale dependent upon the income."

Dr. Barker then details the way of carrying out these kitchens; and lays down rules for their management.

"Steps" (he adds) "have lately been taken to establish two kitchens (in town and village) of the kind now suggested. On another occasion, I may, perhaps, give an account of their management, etc. In the meantime I shall be most happy to give all the information in my power to any one desirous of establishing such an institution."

No one can praise too highly the establishing of kitchens in connexion with dispensaries and hospitals, and for this plain reason, that proper food is, in a great many out-door patients, of much more importance than mere drugs; that drugs, without such food, are often quite unavailing for the cure.

In a pamphlet entitled *The Painless Extinction of Life in Animals Designed for Human Food*, Dr. MacCormac recommends the use of carbonic acid as the means of destroying the animals. He would have them killed just as dogs are in the Grotto del Cane. Afterwards they might be let blood; but this he objects to on account of the loss of food entailed thereby. It does not appear that he has experimentally tested his proposal.

At the annual meeting of the Parisian Surgical Society, the *éloge* of Mr. Guthrie was pronounced by the Secretary, M. Legouest. M. Legouest related the life of Mr. Guthrie, followed him through the campaigns of Spain and Portugal from 1807 to 1813, and represented him as assisting the wounded at Waterloo. His eulogy appears to have excited the jealousy of the critic, who thus speaks of the discourse.

"He showed us Mr. Guthrie in private life, in private practice, rich, honoured, and esteemed; he spoke of him as an army surgeon in the field, as a civil practitioner, as professor, as operator, and as the author of remarkable works. And yet, who was there, of those listening to M. Legouest, who could boast that he knew the English surgeon as writer, as operator, as professor, as military surgeon, or as private practitioner?"

POISONOUS HERBAGE. Specimens have been brought to Sydney of the poisonous bush that has proved so destructive to sheep passing through the desert to the north. Messrs. Devlin and Simpson lost no less than 2,200 sheep from eating this bush. Mr. Devlin describes it as a pretty shrub, about four feet high, with a bright scarlet pea blossom. The botanical name is *Gastrolobium grandiflorum*, and it was first discovered by Stuart in Arnheim's Land.

Association Intelligence.

BRANCH MEETING TO BE HELD.

NAME OF BRANCH.	PLACE OF MEETING.	DATE.
BATH AND BRISTOL. [Ordinary.]	Victoria Rooms, Clifton.	Wednesday, Jan. 25, 7.15 P.M.

MEDICAL PROVIDENT FUND.

THE following contributions have been made towards the Guarantee Fund.

	£.	s.	d.
Amount already announced	576	16	0
<i>London and Middlesex:</i>			
Dr. G. T. Gream	21	0	0
Cæsar H. Hawkins, Esq., F.R.S.	10	10	0
<i>Cumberland:</i>			
Dr. S. Lockie (Carlisle)	1	1	0
<i>Essex:</i>			
Henry Laver, Esq. (Colchester)	1	0	0
<i>Hampshire:</i>			
John Covey, Esq. (Alresford)	5	5	0

Further contributions will be announced.

Gentlemen desirous of contributing to the Guarantee Fund, will oblige by forwarding their names and the amount of their donations, either to the Chairman (Dr. Richardson, 12, Hinde Street, Manchester Square, W.); or to the Secretary (Dr. Henry, 15, George Street, Portman Square, W.)

B. W. RICHARDSON, M.D., *Chairman*.

ALEXANDER HENRY, M.D., *Secretary*.

London, 19th January, 1865.

WEST SOMERSET BRANCH: QUARTERLY MEETING.

A QUARTERLY meeting was held at Clarke's Castle Hotel, Taunton, on Wednesday, January 11th, at 7 P.M.; HENRY ALFORD, Esq., in the Chair.

Letters from the President, Dr. Kinglake, and from several other members, expressing their regret at being unable to attend, from illness and other causes, were read.

New Member. A. G. Cox, Esq., of Crewkerne, was elected a member of the Association and of the Branch.

Medical Provident Fund. A letter was read from Dr. Henry; and, after some discussion, it was resolved, that the subject of electing a Director to the Provident Relief Fund, be proposed to the annual meeting.

Communications. The following communications were read:—

1. The effect of Iodine in retarding the Growth of the Fœtus, and its application in Cases of Deformed Pelvis. By Hugh Norris, Esq. This paper elicited an interesting discussion. Mr. Norris was requested to send his paper for publication in the JOURNAL.

2. Mr. S. Farrant gave the result of his experience of the use of Tincture of Digitalis in Delirium Tremens. He had found that when given in three-drachm doses (P.B.), very speedy and marked beneficial effects followed. If the tincture was good, the patient was often tranquillised almost immediately, and fell asleep in an hour or two; if not, a second and third dose were administered at intervals of five or six hours, until sleep was induced: and this successful result never failed to happen; and he never observed any depressing or injurious effects follow.

BIRMINGHAM AND MIDLAND COUNTIES BRANCH: GENERAL MEETING.

A GENERAL meeting of this Branch was held at the Old Library, Birmingham, on Thursday, January 12; FURNEAUX JORDAN, Esq., in the Chair.

Paper. The following paper was read:—

On Holt's Treatment of Stricture of the Urethra, illustrated by several successful cases. By J. S. Wilders, Esq.

Reports of Societies.

OBSTETRICAL SOCIETY OF LONDON.

WEDNESDAY, DECEMBER 7TH, 1864.

HENRY OLDHAM, M.D., President, in the Chair.

PROFESSOR Pajot, Professor Hecker, and Dr. Marion Sims, were elected Foreign Honorary Fellows; and two ordinary Fellows were elected.

Specimens. Mr. GAYTON presented to the Society a pair of forceps with a spring-racket attached to the handles, as made at his suggestion, and employed by himself on many occasions without a still-birth.

Dr. BARNES exhibited a piliferous cyst of the ovary.

Mr. BAKER BROWN showed a large fibroid tumour and uterus, the latter containing a large mass of fibroid growth to which the ovaries were adherent, and enlarged by cystic disease. It was proposed to remove only the large mass. Upon opening the abdomen the tumour was found to be pendulous, attached to the uterus by a very small pedicle. This was divided by the *écraseur*, but profuse bleeding ensued; and it was then considered advisable to remove the whole uterus and ovaries in one. This was done, the cervix uteri being transfixed by two ligatures an inch and a half from the os, and each broad ligament being pierced with a needle and tied with strong twine. After the removal of the mass it was found that the ligature of one of the broad ligaments had slipped, and that bleeding was going on. It was taken up with the vulsellum, and a second ligature applied. The external wound being closed, the patient went on very well for ten hours, when, suddenly vomiting, she became faint, and shortly afterwards died. It was found at the *post mortem* examination that bleeding had taken place from a portion of the broad ligament which had not been included in the second ligature. Mr. Brown remarked that in any future case he should tie the broad ligament with a double instead of a single ligature, to prevent the possibility of slipping.

Dr. GRAILY HEWITT exhibited Dr. Marion Sims's modification of Chassaignac's *écraseur*, which did not arrive in time for the last meeting.

On *Puerperal Embolism*. By W. F. WADE, M.D. (Birmingham.) The author reviewed the history of the disease, which he took as a real evidence of the progress of medicine. He entered into a description of its nature and varieties, and gave a sketch of Virchow's doctrine and of his experiments upon the production of emboli. He then described a case which had occurred in his practice, in a woman suffering from phlegmasia dolens, who was suddenly, during exertion, seized with severe dyspnoea three weeks after her delivery. The pulse was feeble; skin cold and clammy. This state continued, but became each day more severe, for a fortnight, when she died. As was prognosticated, a large clot was found in the pulmonary artery, extending from the third or fourth ramification.

Dr. GREENHALGH stated that cases of fatal embolism after parturition were rare. He had met with but one case in his own practice. It occurred in a very healthy young lady, who had been confined of her first child. She had had a perfectly normal labour, not followed by hæmorrhage or any untoward circumstance beyond some acceleration of the pulse on the third day after delivery. She was suddenly seized during the evening of the sixth day after her confinement with severe dyspnoea, acute agony in the cardiac region, and intense mental excitement, speedily followed by alarming prostration and death in less than three hours. No *post mortem* was made.

Dr. BALLARD asked if there had been any febrile disturbance in Dr. Greenhalgh's case.

Dr. BARNES observed that the history of this case and of others in which embolism followed upon phlegmasia dolens had an important bearing upon treatment. Thus it was usual, after the subsidence of the acute symptoms of phlegmasia dolens, to rub the affected limb with the view of promoting absorption and supplying passive exercise to the muscles and other tissues. It might be that this friction would favour the detachment of a clot from the femoral vein, which being thrown into the circulation would constitute "embolism." This danger should be borne in mind. He thought the connection between a febrile state and clotting or thrombosis, suggested by the question of Dr. Ballard, was very frequent. He believed in most cases of phlegmasia dolens there was a pre-existent abnormal state of the blood which predisposed to coagulation. He (Dr. Barnes) had gathered up in his memoir on Thrombosis and Embolia, published in the Society's *Transactions*, vol. iv, most of the information at the time extant upon the subject. Since then, however, our information had been considerably enlarged by the publication of new cases.

THE BEST MODE OF DELIVERING THE FETAL HEAD AFTER PERFORATION.

BY J. ERANTON HICKS, M.D., F.R.S.

In introducing the subject of this paper, the author said that, notwithstanding the employment of premature labour and version, cases would occur in which it was either necessary or desirable to perforate. He pointed out that the subject had of late years not received the attention it deserved. He alluded to the disputes which arose upon Dr. Osborn's case of E. Sherwood, when that physician asserted he could draw a child's head through a brim having an inch and a half antero-posterior diameter, by tilting the base of the skull sideways, and concluded that Cæsarean section might be done away with. The disputes which followed were so acrimonious that the valuable points elicited by Drs. Hull, Hamilton, and Burns were, to a certain extent, lost sight of, at least as far as they were calculated to give any rule in practice. Dr. Burns in particular deduced from his experiments that, the calvarium of the fetal head being removed, the base of the skull could be drawn down easier face foremost than in any other direction. With this the author's experiments entirely agreed. And he pointed out further the advantage of the chin pointing anteriorly during the descent. He further instituted a comparison between the opposing diameters when the face is made to present and the other modes of drawing down the base of the skull. He then proceeded to answer the inquiry: if in cases of extreme lessening of the antero-posterior diameter, it is best to cause the face to present; and if, after simple perforation, it is best to continue vertex presentation, at what degree of reduction of the size of the head do the two presentations cause equal obstruction? This he answered by the results of experiments, which

might be thus concisely stated. That, as is acknowledged by all, vertex presentation in natural labour is the best; and that after perforation and evacuation of the brain up to the extent of one-fourth, this rule holds good; yet if the evacuation of the brain and collapse of the calvarium by this means, or by more or less fracturing the bones, be carried to a greater degree, we find that the facial presentation affords the easiest mode of delivery, provided that the mentobregmatic falls beneath the bizygomatic diameter. And further, that if we remove the whole calvarium, leaving merely the base, and then induce face presentation, taking care that the chin, as it descends, points anteriorly, we diminish to the smallest possible amount, short of wholly breaking it up, the opposition of the head, leaving only from one to one and a half inch in depth to oppose the conjugate diameter of the brim, and from three to four inches at the outside to oppose the transverse. The author, as practical deductions from these facts, recommended that in cases where simple perforation failed, to allow the descent of the head in cases of obstruction,—say above three inches antero-posterior diameter,—to break up purposely and carefully the bones of the calvarium, and remove at least a portion, preserving the scalp as protection to the edges, and then to induce face presentation. That when the diameter was under three inches, then to remove all the calvarium and then to induce face presentation, taking care to bring the chin forwards, if not already in that direction. Dr. Hicks then pointed out the facility of doing this with a small blunt hook, which could be readily and without chance of injury passed up to the orbit. The chin he had found had a tendency to point anteriorly upon being drawn down. He then entered upon some useful details, and compared this mode of craniotomy with the cephalotribe. He remarked that by this means, in deciding upon whether craniotomy or Casarean section should be performed, the head was not so much to be considered as the size of the body, in cases of brim obstruction.

The paper was illustrated by eight cases of craniotomy, six of which were required for contraction of the conjugate, and two for obstructions in cavity. In all the induction of face presentation was attended by instant and complete passage through the obstacle. In some of the cases the shoulder and pelvis of fœtus gave more difficulty than the head. The paper was accompanied by details of the experiments.

Dr. GREENHALGH considered that the author had done much service to the profession by bringing the subject forward in such a scientific and practical manner. He drew attention to the dangers attending cases of extreme deformity of the brim, remarking that there was a wide difference between extraction and safe extraction, especially (as is often the case) where the passages are swollen and inflamed. He called to mind the occasional difficulty of entering the skull with the perforator, and quoted a case where this was almost impossible. He thought, from a case which he had seen at Vienna, that he should use Braun's cephalotribe in a future difficulty. He had, in a case where the whole vault of the calvarium had been entirely removed before he arrived, delivered by fixing three crotchets outside of the presenting part.

SPECTRUM ANALYSIS. No less than four new elementary bodies have already been discovered by means of spectrum analysis: cesium and rubidium, by Bunsen; thallium, by Mr. Crookes; and indium, by Reich and Richter of Freiberg; whilst the foundations of solar chemistry, laid by Kirchoff, have been rendered more secure by the observations of Cooke in America; Donati in Italy; and Miller and Huggins in England.

Correspondence.

PRYCE v. BOWEN.

SIR,—Mr. Lund, finding that he has brought upon himself the censure of the medical press, and the just indignation of the whole profession, now comes forward and regrets the consequences which have arisen from his having given an opinion on the case in question, and trusts that the profession will withhold their final judgment until he has made a story for himself.

The first question which naturally suggests itself is, What was Mr. Lund's object in placing himself in the witness-box? Perhaps Mr. Lund will answer this question. He never attended the plaintiff. Had he done so, his conduct would have been excusable, as he could not have helped giving evidence if subpoenaed; but, as he himself tells us in a letter to you published in the *JOURNAL* of January 7th, he was called to give an opinion in respect of the treatment of the case during the first nine days after the accident, which opinion he founded on the written declaration of the plaintiff, knowing he was sought as a medical expert to give such an opinion as would support the evidence for the prosecution, and so assist in damaging the reputation of a professional brother, and mulct him in damages.

Without going into the difference of opinion given by the different surgeons at the trial, in which Mr. Lund appears to differ from the majority of practitioners, with, perhaps, the exception of Evan Thomas, jun., M.R.C.S., the bone-setter's son,—I must ask, Is Mr. Lund a man of such world-wide reputation that he should consider himself fit to call in question the treatment pursued in the case? I will now just state what the medical press and *Directory* give of the claims both of Dr. Bowen and Mr. Lund to public confidence.

Dr. Bowen was in the Crimea, where he had more opportunities of seeing surgery than most surgeons in civil practice. He afterwards settled at Chester, was surgeon to the Infirmary, and, on succeeding Dr. Dixon at Birkenhead, became surgeon to the Borough Hospital; and so highly does it appear he was thought of in the medical school where he was educated, that Mr. South, the senior surgeon and professor of surgery in the medical school in question, came all the way from London to give evidence in his favour.

Who, then, is Mr. Lund? The *Medical Directory* represents him as a teacher at the Manchester Medical School, and surgeon to the Dispensary attached to the Royal Infirmary; but *not* surgeon to the Manchester Infirmary, as stated in the reports of the trial. Is he, therefore, so much Dr. Bowen's professional superior, that he can call his treatment in question?

Liverpool was canvassed without success; and we must all congratulate Manchester that none of her great names were found in the witness-box of the Liverpool Assize Court in an action for malpraxis against a professional brother.

This, sir, is a question for the whole profession to stand up against. If it were not for the fact that a man of some professional standing had been found to support the evidence of Evan Thomas, the case never would have been brought into court. We all stand on the brink of a precipice. None of us can tell who will be the next, unless medical men resolve to be true to their profession and true to themselves, and strongly deprecate such proceeding in any case in future.

Dr. Bowen, I have been informed, has been put to great expense, although he gained a verdict; and, I fear, as his opponent is only a journeyman cabinet-maker, it is scarcely likely he will even get the taxed costs. It is, therefore, to be hoped that the profession will not let Dr. Bowen be the loser. Dr. Scholfield, of 14, Hamilton Square, Birkenhead, has been appointed to receive subscriptions on Dr. Bowen's behalf. I am, etc., M.D.

Birkenhead, January 11th, 1865.

SIR,—The profession again rejoices in the satisfactory termination of a recent trial, which has already been so fully and so fairly dealt with in your impression of last week.

One point of importance to consider is, the origin of these trials. Do they entirely arise from the evil influence of the local bone-setters? or do our professional brethren occasionally help to give rise to them? I fear the latter is but too frequently the case. How often do dissatisfied patients consult a second "doctor", to ascertain if their bone be set right; and, although this second doctor may refrain from expressing any actually prejudicial remarks, yet he may, by a surprised look, an unsatisfactory "humph", virtually leave the discontented patient even still more dissatisfied. The patient forthwith hurries off to the bone-setter; and, as a matter of course, is informed that everything his doctor has done for him has been wrong; that the bone was either not set right, or not set at all. Such was doubtless the origin of Dr. Bowen's case.

The results of trials against professional gentlemen have of late years been exceedingly satisfactory, and the recent case of Pryce v. Bowen particularly so. Yet, while we congratulate Dr. Bowen upon the happy issue of his trial, which must necessarily have involved him pecuniarily in a considerable sum, and occasioned him no little anxiety of mind, we feel bound, on the other hand, to censure his professional brother, without whose support the case could never have been brought into court.

True it is, that out of evil often comes good. The practitioner, in the honest and straightforward exercise of his calling, will now feel more than ever secure from these scandalous persecutions, knowing that his professional brethren will glad rally round and support him in time of need.

I am, etc., X. Y. Z.

Liverpool, January 2nd, 1865.

SIR,—If there is any lesson more important than another to be gained by the case of Pryce v. Bowen, it is this, that every member of the profession is bound by every honourable feeling, first of all to protect his brother practitioner from the ignorant and the designing, and to be extremely jealous of siding in any legal action against him without knowing all the facts on both sides, whether personally acquainted or not with the defendant. In such a case, when a young, amiable, and skilful practitioner's reputation is at stake, a man universally loved and respected by his surrounding brethren, which latter would rather have excised their own tongues than have borne witness against him—in such a case, there ought to be no room for an error of judgment. I hold that in such a case the prosecuting surgeon is, as you say, "without excuse". Let me suggest that the best reparation which Mr. Lund can make for the error which he now regrets he made is to send his fee towards the expenses of Dr. Bowen. I am, etc.,

A LIVERPOOL GENTLEMAN AND M.D.

MEDICAL ERRORS.

LETTER FROM A. W. BARCLAY, M.D.

SIR,—I am sorry to find that in the letter addressed to myself by Dr. George Johnson, published in the BRITISH MEDICAL JOURNAL of the 14th inst., he accuses me of having been unjust in my criticism, of having attempted to dispose of his proposition "by a sneer", and of being "surprisingly inaccurate" in my statements—three grave charges, which ought not to be made without due cause, and of which I can honestly say that, if guilty at all, my conscience acquits me of any intentional offence. I trust you will permit me to show, in as few words as possible, that I too consider "an accurate statement of facts at least as important as a logical argument;" fully believing that I shall clear myself in the judgment of those who are unprejudiced in the matter, and prove that Dr. Johnson has mistaken the drift of my argument.

He objects to the phrase, "one or two remarkable recoveries," because there were twelve recoveries in all. Were they *all* remarkable? I think not. My own experience of cholera would have led me to expect several of the cases detailed to recover without any treatment at all.

He next objects to my statement, that the theory was not properly tested by experiment before it was brought publicly forward. In my humble belief, the number fifteen was far too small for such a purpose; and, as a question of fact, no attempt at experiment in a logical sense was made. I can find none throughout the volume which Dr. Johnson has been so kind as to send me. His argument, whether as regards the fifteen cases first published, or the whole number subsequently treated, is simply of the *post hoc ergo propter hoc* kind. I do not think I have, even by implication, asserted that the assumption was based on the fifteen cases; but on a mistaken analogy with mineral and vegetable poisons. It is possible that there may be proof that the plans of Dr. Stevens or Dr. Ayre "have been attended with the largest amount of success;" it is also possible that such plans may be "essentially eliminative in their tendency;" and I am quite prepared to accept Dr. Johnson's statement, that these views prompted his conclusions. But he must permit me to remind him that they are both assumptions, on which he proceeds to build a third hypothesis, and then asks the profession to accept twelve recoveries out of fifteen cases as a sufficient testing by experiment.

Dr. Johnson thinks he has detected me in a "medical error", because I have used the expression, "the thickened condition of the blood following on the abstraction of serum." I am quite ready to admit that the phrase carries a wider significance than I intended. I merely meant, that the blood is deficient in water; and that the passing away of the watery part was one change out of many which altered its condition and rendered it unfit to maintain life. This "fact" of increased specific gravity from loss of water has not yet been "refuted", as far as I am aware.

Dr. Johnson goes on to say that I doubt or deny the existence of a morbid poison as the essential cause of cholera. Whence he has gathered this information I cannot divine, because I have boldly asserted it, in opposition to the atmospheric and other theories, on the faith of Dr. Baly's logical induction on the subject. But I hold that this poison, this something from without, when taken into the system, sets up a series of changes in various organs, by which it is multiplied and multipliable to an almost unlimited extent; that so long as these

changes are going on, no elimination can take place; and that, when they cease, it ceases to be a poison, and can no longer excite them. We cannot eliminate the changing tissues, and so the diseases arising from such causes stand in a wholly different category from mercurial tremor and lead-palsy, where we naturally try to eliminate the poison. The conclusion seems to me inevitable, that, if the poison of cholera ought to be eliminated, so ought the poison of small-pox. And I cannot at all admit that the morbid secretions in the digestive canal—the “internal cesspool”, as I think he elsewhere calls it—should be substituted for what Dr. Johnson and I alike mean when we talk of the “morbid poison” by which an attack of cholera or small-pox is induced. To empty the intestinal canal is not to “eliminate the poison”. But I will go one step further, and say that, supposing it to be very desirable to remove these morbid secretions, there is not one proof offered in the *Treatise on Epidemic Diarrhœa and Cholera* that castor-oil had any such influence until the natural process of recovery had begun, when the oil also began to take effect. Indeed, the problem of its action is one which physiology is not as yet able to solve; but the large quantity administered in these cases lends countenance to the hypothesis that, like calomel, castor-oil was not absorbed in the collapse of cholera; and that, without previous absorption, neither remedy can act as a purgative.

It is not my intention now to enter into any discussion of the value of the castor-oil treatment in cholera. Seldom has the verdict of the profession been more unanimous or more speedily arrived at than when it agreed that castor-oil could not cure the disease. Its influence for good or harm is as yet perhaps undetermined, and Dr. Johnson may in some future publication be able to prove experimentally what is its action in such cases. The result, whatever it may be, will not in the least affect the validity of my argument, and I fear that it must have been very imperfectly stated when one of such eminence in the profession has failed to perceive its meaning. My object in the Lumenian Lectures was to call the attention of the profession to the want of logical reasoning in most of our own writings. I felt that it was vain for us to attempt to oppose quackery when the arguments which pass muster among ourselves are so faulty. It seems no more than common sense and common prudence to demand, that before a remedy is pronounced to be capable of curing a disorder, some evidence of the relation of cause and effect should be adduced. Logical writers have laid down rules by which we may judge whether the evidence presented proves a “law of causation” or merely indicates an accidental sequence or coincidence. I have endeavoured to show that when the number of instances is small, the evidence must be distinct and the law definite; that it is very unsafe to propound an hypothesis except when based on a broad accumulation of facts; and that when no law can be suggested and we are driven to the alternative of statistics to establish the point, the number of cases required is enormous.

From this point of view it is quite immaterial whether castor-oil be the best, and brandy and opium the worst remedies in cholera, as asserted by Dr. Johnson, or *vice versa*. The fifteen cases mentioned in his first letter on the subject gave no logical support to the theory, and were only calculated to mislead the public, because there happened to be twelve recoveries among them. In the larger enumeration of fifty-four cases set out at length in the volume, there are none that can be pointed out as in any way suited to test the theory experimentally. And as a contribution to the statistics of cholera, the whole num-

ber of 150 cases treated with castor-oil, collected by the Board of Health, is just as insufficient to prove that is valueless, as Dr. Johnson's cases are to prove that its action is on the whole beneficial. On these points, no one who has studied inductive reasoning can arrive at any other conclusion. It is quite possible that in alluding to the theory I may have expressed myself too strongly, because my own conviction went further than a mere condemnation of the mode of reasoning—a conviction strengthened, if not derived, from the report of Drs. Paris, Babington, Tweedie, and Baly, who “found, on an examination of Dr. Johnson's cases, that eleven of them were cases of cholera in a state of collapse, of which six were fatal. Five other cases of cholera did not pass into a state of complete collapse—these terminated in recovery.”

I am, etc.,

A. W. BARCLAY.

Bruton Street, Jan. 18th, 1865.

Medical News.

ROYAL COLLEGE OF SURGEONS OF ENGLAND. The following members of the College, having been elected Fellows at previous meetings of the Council, were admitted as such on January 12th.

Blathwayte, William, Louth, Lincolnshire: diploma of membership dated September 27th, 1852

Kilner, John, Bury St. Edmunds: April 12th, 1843

Nance, James, Eccleshall: October 16th, 1840

Sterry, Henry, J.P., Paragon, Southwark: January 2nd, 1854

Wolfe, Abraham, Gower Street: December 16th, 1859

APOTHECARIES' HALL. On January 12th, 1865, the following Licentiates were admitted:—

Clements, George, Middlesex Hospital

Eccles, George Henry, Felix Terrace, Islington

Miller, Reuben Zacchæus, Richmond, Surrey

Williams, John Hughes, Holyhead

As an Assistant:—

Haddock, Job, Bridge Street, Runcorn, Cheshire

APPOINTMENTS.

*JONES, C. Handfield, M.B., F.R.S., elected Physician to St. Mary's Hospital, in the room of Dr. Chambers.

*WELLS, Soelberg, Esq., appointed Ophthalmic Surgeon of King's College Hospital.

ARMY.

BARRY, Staff-Assistant-Surgeon T. S., to be Assistant-Surgeon Royal Artillery, *vice* G. A. Grant.

ROYAL NAVY.

ASHFORD, J. W., Esq., Assistant-Surgeon, to the *Donegal*.

BREND, Alfred, Esq., Assistant-Surg. (additional), to the *Euryalus*.

DEVONSHIRE, C. J., Esq., Assistant-Surgeon, to the *Penguin*.

DOYLE, E. W., Esq., Acting Assistant-Surg., to the *Princess Royal*.

DUNWOODIE, John, Esq., Surgeon (additional), to the *Euryalus*.

MAIR, George, Esq., Assistant-Surgeon (additional), to the *Fiscard*.

O'FLAHERTY, Thomas A., Esq., Assistant-Surgeon, to the *Lamirail*.

PATTELO, William, M.D., Assistant-Surgeon (additional), to the *Euryalus*.

RICHARDSON, F. H., Esq., Assistant-Surgeon, to Plymouth Hospital.

SISSENS, W. H., Esq., Assistant-Surgeon, to the *Britannia*.

WRIGHT, Frederick L. W., Esq., Assistant-Surgeon (additional), to the *Euryalus*.

DEATHS.

BROWN, William H., Esq., Surgeon, of Lee, Kent, aged 55, on January 15.

COLEY, On January 2nd, at Paddington, aged 64, Rachel, widow of H. F. Coley, M.D.

FENTEN, On January 8th, at Eyam Terrace, Eyam, Derbyshire, aged 21, Wm. Hattersley, second son of *Thomas Fentem, Esq.

FOGARTY, Frederick W., M.D., at Marychurch, Devon, on Jan. 15.

TOHBY, On January 15th, in Upper Porchester Street, Jane Frances, widow of Richard Tohby, M.D., Surgeon R.N.

WALKER, On January 18th, at Woburn, aged 22, Frances Harriet, eldest daughter of the late E. D. Walker, M.D., of Teignmouth.

WILLIAMSON, Henry G., M.D., of Holmes Chapel, at Nantwich, aged 25, on January 1st.

Mr. KIERNAN is, we regret to hear, suffering from an attack of paralysis.

A DEATH FROM CHLOROFORM occurred on November 1st, 1865, in the Devon and Exeter Hospital.

ROYAL COLLEGE OF SURGEONS. Mr. Partridge is this year designated as the deliverer of the Hunterian Oration.

GRANT MEDICAL COLLEGE, BOMBAY. The Chair of Anatomy and Physiology in the Grant College of Bombay is now vacant.

COST OF LUNATIC PATIENTS. In the Sussex County Lunatic Asylum, the weekly cost of the patients per head per week is 9s. 9d.

BEQUEST. The late Jacob Stiebel, Esq., of Pembroke Terrace, Bayswater, has bequeathed to University College Hospital £5,000.

BLACKBURN HOSPITAL. The Blackburn Infirmary was opened on the 2nd inst. as a general hospital, a regular staff of medical men having been appointed. It had previously served as an infirmary of the Blackburn Relief Committee.

TESTIMONIAL TO DR. GIBBONS. A handsome goblet and snuff-box have been presented to Dr. Gibbons, medical officer of the Wolverhampton Workhouse, by his fellow officers, as "a mark of their high esteem."

ROYAL COLLEGE OF SURGEONS. Professor Huxley, F.R.S., will deliver twenty-four lectures on the Mammalia in continuation of his former course, commencing on Monday, February 6th, to be followed by Professor Fergusson.

DR. BROWN-SÉQUARD. We notice by the *Boston Medical and Surgical Journal* that this distinguished gentleman will be prevented by ill-health from delivering his course of lectures contemplated in connection with the course of the Boston Medical College this winter.

DEATHS FROM ACCIDENT. During the past week in London 65 persons lost their lives by accidents, 33 died from fractures or contusions (of this number 6 were killed by vehicles in the street), 11 infants and one adult were suffocated, and 13 deaths ensued from burns or scalds. A female, aged 30 years, died from taking cyanide of potassium by mistake for medicine.

A NEW REMEDY. The sting of a wasp or a bee is, we are told by a Frenchman, a very valuable remedy; and *apisination* has a marvellous virtue in cases of marsh-fever, yellow fever, headaches, nervous gastralgia, cholera, and the plague. Gasparin, we are told, cured himself of muscular rheumatism and a bronchitis by the sting of a wasp. The remedy truly is not an agreeable one, but perhaps not much more disagreeable than a blister, and not so disagreeable as a moxa. (*Chem. News.*)

STRUCTURE OF NERVES. M. Roudanovsky has lately made some interesting discoveries on the structure of nerves. He cuts very thin slices after subjecting the nerves to congelation; and with these he has been enabled to determine that the primitive elements of nerves are tubes having a pentagonal or hexagonal configuration. The walls of these tubes are formed of a conjunctive tissue, which in a bundle forms a true reticulum. As to the constitution, he says that every nerve has a substratum of brain-matter, and also of the spinal marrow, and probably of the ganglionic matter also. The grey matter, he says, is the fundamental nervous substance, and plays the principal part in the functions. Energetic poisons, like strychnia and nicotine, affect the nervous cellules; while other poisons, such as opium, chloroform, and perhaps alcohol, modify the myeline.

LONDON MEDICAL SOCIETIES. Dr. Peacock has succeeded Mr. Hewitt as President of the Pathological Society; and Dr. Murchison becomes Secretary vice Dr. Bristowe. At the Obstetrical Society, Dr. Barnes is elected President in the place of Dr. Oldham; and Dr. Graily Hewitt, on retiring from the Secretary's chair, becomes Treasurer. Dr. Meadows fills Dr. Hewitt's place. Mr. Longmore succeeds Mr. Adams as President of the Harveian Society.

SANITARY IMPROVEMENTS IN LIVERPOOL. The grand jury at the Liverpool Quarter Sessions made a presentment, upon information furnished by Dr. Trench, the Liverpool medical officer, condemning twenty-nine lots of property in the borough, as unhealthy and unfit for human habitation. The presentment recommended either their entire demolition or their complete alteration. This is the first important proceeding under the Liverpool Sanitary Amendment Act, passed last Session.

OXFORD, THE MURDERER. Outside is a small group of gardeners labouring with the minute labour of love upon a patch of ground committed to their care; and, again, you come upon a few painters, with Edward Oxford, now a fat, elderly man, at their head, all busy, and Oxford himself carefully graining a door in beautiful style. Oxford has now perfectly recovered his sanity, and is the most orderly, most useful, and most trusted of all the inmates of Broadmoor. A small pecuniary reward is given to those who labour well as an inducement to others to do likewise, and this money they are allowed to spend in any harmless way they please. Out of his small earnings Oxford has between £50 and £60 carefully saved. (*Times.*)

MAGNESIUM LIGHT. A burning magnesium-wire of the thickness of 0.297 millimetre, evolves as much light as seventy-four stearine candles, five to the pound. If this light lasted one minute, 0.987 metre of wire, weighing 0.120 gramme, would be burnt. In order to produce a light equal to seventy-four candles burning for ten hours, whereby about twenty pounds of stearine are consumed, 72.2 grammes (2½ ounces) of magnesium would be required. The wire is now to be had at the low rate of threepence per foot; and half an inch of the wire evolves, on burning, light enough to transfer a positive image to a dry collodion plate; whilst, by the combustion of ten grains, a perfect photographic portrait may be taken, so that for photographic purposes alone the magnesium light will prove most important. (*Phar. Jour.*)

MEDICAL SERVICE IN THE UNITED STATES ARMY. The President of the Royal College of Surgeons of Ireland has received the inclosed letter:—"Nashville, Tenn., U.S.A., 16th Oct., 1864. To the President of the Royal College of Surgeons, Ireland. Sir,—As there are generally a large number of talented, educated, and adventurous young gentlemen in the medical profession in Ireland seeking for profitable employment in their profession, the writer sends the inclosed scrap of correspondence from the *Cincinnati and Ohio Commercial* of October 14th. Besides those required for Ohio, the new regiments of coloured troops are in need of surgeons, all paid by the United States Government regularly, and higher salaries than in the British service. It is, besides, a good school for young practitioners. Hospital stewards or medical cadets are also needed. No medical gentlemen are more thought of or respected here in the service than regular Irish surgeons, as they are generally, without exception, educated gentlemen.—Respectfully yours, J. A. Lynch, Captain and Assist. Quartermaster, U.S.A." [We have just read a letter from a gentleman (an American) who held a high

position as medical officer in the Federal army. His account of the service was far from a flattering one. He had been forced to retire from the service on account of the lowness of the pay, which, under the depreciated currency, was insufficient to keep his family. His health was also greatly damaged by the incessant fatigues to which he had been subjected in the discharge of his duty. EDITOR.]

HEALTH OF SCOTLAND. The Registrar-General reports the deaths in the eight principal towns of Scotland in the month of December (2,411) to be the average number; but 31 per cent. of them have to be recorded as due to the zymotic (epidemic and contagious) class of diseases. Typhus fever caused more than 10 per cent. of the whole mortality; in Paisley 12.5 per cent., and in Greenock as much as 20 per cent. This has been the most severe epidemic of typhus fever which has existed in Scotland for many years. 91 deaths were attributable to violent causes, 16 of them to the upsetting of a Clyde ferry-boat. The births in the month (3,139) were above the average, and the marriages (884) reached by far the highest number registered for the month during the ten years of registration. The mean temperature of the month was rather above the average; the rainfall, the smallest the Registrar-General has recorded in December, the mean of the eight towns being 3.42 inches, which is 1.05 inch below the average. The greatest depth of rain was as Greenock—5.47 inches.

INSANE PAUPERS. The annual return of insane paupers in England and Wales at the beginning of the year has been issued. The return is made up to January 1st, 1864, and includes all but a few parishes rendering no account. The total number of paupers in receipt of relief on that day was little over a million—a considerable decrease (of above 130,000) as compared with January 1st, 1863; but the number of insane paupers had increased, and amounted to 37,576, of whom 27,590 were lunatics and 9,986 idiots. Thus, the pauperism ascribable to insanity, which was 3.17 per cent. of the whole pauperism on January 1st, 1863, was as much as 3.7 per cent on January 1st, 1864. In every 100 insane paupers 44 were males and 56 females. The distribution of pauper insanity appears to be very unequal. Thus, at the date of this return, London had among its 103,468 paupers as many as 5,859 insane; the south-western counties had among their larger total of 108,628 paupers only 3,705 insane. So, also, in the eastern counties among their 80,771 paupers there were but 2,456 insane, and in Wales also only 2,432 out of a total of 79,841; but stepping across the Welsh border into the west-midland counties (including Stafford, Warwick, Worcester, and Gloucester) we have 4,887 insane, double the last two numbers, among the not so greatly increased total of 104,894 paupers. Of the 37,576 insane paupers the number in county or borough lunatic asylums had risen to 20,257; the number in workhouses was still as large as 9,608.

PRESENTATION FROM THE QUEEN TO DR. CASS. On New Year's Day Dr. Cass, of Cowes, received through the hands of Sir Charles B. Phipps a massive and magnificent silver inkstand, "as a memorial from the Queen of her Majesty's appreciation of his skill and attention during the many years he attended in his professional capacity at Osborne." Dr. Cass, who has long been held in very high esteem at Cowes, had been the medical attendant upon the Royal family and household at Osborne for nearly twenty years; but, finding of late that his sight had become so seriously impaired as to threaten absolute blindness, he felt constrained, though still in the prime and vigour of his life, to resign his appointment at Osborne, and to withdraw altogether from the profession in which

he had established a high and well-earned reputation. This circumstance has been a matter of universal regret throughout the whole of the wide district over which Dr. Cass's practice extended; but amongst the many expressions of sympathy which have reached him from all quarters none have been so warm, and none, of course, so deeply gratifying as those which have been conveyed to him from the Queen. "Her Majesty," says Sir Charles Phipps, in the letter which accompanied the costly memorial, "hears with great regret that she shall no longer be able to avail herself of your valuable medical services; and the Queen still more laments the sad cause which has thus forced you to abandon your profession at an age when your usefulness should be greatest." Again, Sir Charles Phipps says, "I am directed to express her Majesty's sincere sympathy for the affliction which has obliged you to discontinue your valuable services." These are queenly words, and well calculated to convey to Dr. Cass the highest solace he can possibly receive under the calamity which has fallen as a fatal blight upon his professional career, and marred the fairest hopes and promise of an honourable and laborious life.

THE QUEEN'S COLLEGE, BIRMINGHAM. At the quarterly meeting of the professors held on the 10th inst., Professor Postgate said that he and Dr. Hinds had had an interview with the Earl of Lichfield. His lordship stated that he had learnt from the Charity Commissioners that the affairs of the college were in the hands of the Attorney-General, and would soon be in the Court of Chancery, and that that Court would come to some practical settlement of the college difficulties. His lordship spoke very hopefully of the prospects of the college. It was suggested to him that pending the settlement of the affairs of the college, some scheme should be adopted for carrying on the college—that that wing of the college ought to be made productive, and that for this purpose the Theological Department ought to be brought down from the Crescent to the college. His Lordship said he had made efforts in this direction with Chancellor Law, but had not yet been successful. Dr. Suckling said the public ought to be informed that there was a fair number of students, and that the work of the college was going on in a successful and promising manner. He also said the professors now worked harmoniously with each other, and with the Dean of the Faculty.

ODONTOLOGICAL SOCIETY. The annual meeting of this society was held on the 9th inst., Edwin Saunders, Esq. (President), in the chair. Contributions to the museum were announced from Messrs. Hepburn, Lord, and Statham. Mr. Hulme mentioned a case in which a lady had three front teeth attacked by tartar; they could be readily removed and replaced. The curious point was that, although that state continued about seven years, the presence of the teeth had preserved the gum from being absorbed. The President then read the balance-sheet and the report of the Audit Committee. It shewed an excess of expenditure over the receipts of £7:4:1 for the past year. The total balance in the hands of the Treasurer was £539:4:6. The report of the Library Committee shewed an addition of 102 volumes during the past year. Fourteen non-resident, four resident, and one corresponding member had been elected, making a total of 302 members. The following officers were then elected to serve during the present year. *President*, T. A. Rogers, Esq. *Vice-Presidents* (resident), W. A. N. Cattlin, Esq.; W. Inrie, Esq.; W. Perkins, Esq.; G. A. Ibbertson, Esq.; and James Parkinson, Esq.; (non-resident), W. K. Bridgman, Esq. (Norwich); S. Tibbs, Esq. (Cheltenham); Dr. Roberts (Edinburgh);

J. R. H. Moore, Esq. (Dublin). *Treasurer*, Arnold Rogers, Esq. *Librarian*, J. B. Fletcher, Esq. *Honorary Secretaries*, A. Coleman, Esq.; C. Vasey, Esq.; and T. Underwood, Esq. *Councillors* (resident), T. Sheffield, Esq.; C. Fox, Esq.; H. T. Kempton, Esq.; R. T. Hulme, Esq.; G. Owen, Esq.; A. Hill, Esq.; S. Cartwright, Esq.; E. J. Winterbottom, Esq.; J. Saunders, Esq.; F. Weiss, Esq.; and N. Stevenson, Esq. (non-resident), C. D. Rogers, Esq. (Newbury); S. L. Rymer, Esq. (Croydon); E. P. Parkinson, Esq. (Brighton); W. Hunt, Esq. (Yeovil); T. A. Baker, Esq. (Dublin); and T. R. English, Esq. (Birmingham). The retiring President gave his address, glancing at the events of the past year, and paying a warm tribute of respect to the late Samuel Cartwright, their first president. A vote of thanks to the President was proposed by Mr. Rymer and carried by acclamation. Votes of thanks were also proposed to the treasurer, secretaries, librarian, and curator of the museum. The society then adjourned.

THE MEDICAL ACT. The Scottish Branch of the General Council of Medical Education and Registration, at a meeting on the 13th instant, resolved that any Act for amending the Medical Act should be restricted to carrying out the following objects:—1. "To confer on the Medical Council definite powers to issue to the various licensing bodies regulations on the subjects of preliminary and professional education and examination. 2. To amend Clause XL, so as to render it more efficient than it has hitherto been to distinguish between qualified and unqualified practitioners, and to prevent unqualified practitioners from assuming medical titles to which they have no right." To carry out the first or these objects, the Branch Council recommend—"That it shall be lawful for the General Medical Council to issue to licensing bodies such regulations respecting preliminary and professional education and examination as may appear to the Council fitted to secure requisite knowledge and skill. That all regulations passed by a majority of two-thirds of the General Council shall be obligatory on all universities, colleges, and other bodies enumerated in Schedule (A) to the Medical Act. That it shall be lawful for the General Council to intimate to any of the said bodies not conforming to such regulations; that, in the event of the said body not conforming within six months after such intimation, the qualification granted by such body, after the lapse of the said period of six months, shall not be registered. That any body to which such direction shall have been given may appeal to the Privy Council, who shall have power to disallow the direction of the Medical Council. That it shall be lawful for the General Council to restore any right to registration which may have been suspended by them." In order to carry out the second of these objects, the Branch Council recommend a clause to the effect—"It shall not be lawful for any person, unless registered, to take or use the title of Physician, Doctor of Medicine, Licentiate in Medicine or Surgery, Master in Surgery, Bachelor of Medicine, Doctor, Surgeon, Medical Practitioner, or General Practitioner or Surgeon-Apothecary, or Licentiate or Practitioner in Midwifery, or Professor of Medicine, or Professor of Surgery, or any other medical or surgical title; and every person so offending shall, upon conviction, pay a sum not exceeding twenty pounds. The Scottish Branch Council having considered Clause XXXI of the Medical Act, are of opinion that what is objectionable in it would be obviated were the combination and co-operation of the licensing bodies, as provided for by Clause XIX, encouraged or even made obligatory, so that facilities may be given to medical students for acquiring the complete or double qualification without having to

pass repeated examinations on the same subjects; the Branch Council also consider that it is highly expedient that a Bill for amending the Medical Acts should be submitted to the Home Secretary within two months from the present time, so that it may be introduced into Parliament, and passed into a law during the ensuing session." The Registrar laid on the table the registers of medical students, and intimated that from the number of blanks, it was impossible to frame an accurate register of medical students. The Branch Council resolve to report this to the General Medical Council, as an illustration of the necessity for enabling the Council to issue regulations of a compulsory character.

DEATHS IN LONDON IN THE LAST QUARTER OF 1864. In the thirteen weeks that ended December 31st, 19,636 deaths were registered in London. In the corresponding quarters of 1860-62, the numbers of deaths were respectively, 15,197, 15,866, 17,717, and 18,857. The increase in the mortality is chiefly found in the local class, 8535 persons having died from the diseases included under that head; in the same period of 1863, 7639 deaths occurred from the same causes, and in 1861 only 6300. Zymotic diseases in the aggregate were not so fatal as in the corresponding quarters of the two preceding years, the numbers in the three quarters being 5055, 5016, and 4847. The most fatal disease in the list is scarlatina, which caused 1095 deaths. 1064 persons have died from typhus, which shows a large increase in the deaths for the years 1860-63, amounting to 311, 624, 796, and 881. Small-pox was fatal in 120 cases, 81 of which were in young persons. Measles in the last quarter of 1861 carried off 171 persons; in the like period of 1862, 900 fell victims to it, and in the quarter which has just terminated it destroyed 638 lives. Hooping-cough proved fatal to 438 children; in the corresponding quarter of 1863 429 deaths were caused by this disease. Erysipelas and metria show an increase. From the former disease 151, and from the latter 82 deaths were registered. In the quarter which ended January 2nd, 1864, 3470 persons died from pulmonary diseases; in the quarter just ended 4467 persons died from the same causes. 2387 persons died from bronchitis, the numbers who died in the like periods of 1860-63 being 1630, 1553, 1760, and 1831. Pneumonia destroyed 1555 lives; the numbers who died in the periods with which the comparison is made were 1250, 979, 1065, and 1193. 1985 deaths occurred from phthisis. In the same quarters of 1860-63 the numbers who fell victims to the disease were 1785, 1840, 1899, and 2066. From diseases of the brain and nervous system 1927 persons died; 119 from cephalitis, 426 from apoplexy, 376 from paralysis, 22 from insanity, 91 from epilepsy, and 678 from convulsions. Diseases of the heart and blood-vessels occasioned 947 deaths. 572 persons lost their lives by accidents, 230 deaths were occasioned by fractures and contusions, 97 by burns or scalds, 47 by drowning, and 127 by suffocation; of these latter, 115 were young persons, 25 cases of murder or manslaughter, and 64 cases of suicide were registered.

Abstract of a Clinical Lecture

ON

FEVER AND BRONCHITIS AS EARLY SIGNS OF PHTHISIS.

Delivered at the Birmingham General Hospital.

BY

JAMES RUSSELL, M.D.,

ONE OF THE PHYSICIANS OF THE HOSPITAL.

GENTLEMEN,—I have already stated to you that tubercle is a foreign body, a formation foreign to the natural condition of the lungs, inserted into the spongy tissue of those organs. I have also stated to you that it has special preference for a particular part of the lungs; viz., the apex.

Now, upon these two circumstances is based our interpretation of the physical signs of the first stage of phthisis. Viewed by themselves, these signs consist simply in evidence of a certain amount of consolidation of the pulmonary tissue, united frequently, but not necessarily, with signs of irritation or inflammation of that tissue; but they derive their peculiar significance from two collateral circumstances—namely, their local development, and the part of the lungs they affect. When present in that part of the lung which is known to be the chosen *habitat* of tubercle, and when confined to that part alone, comparatively slight evidence of either of the above named conditions acquires a degree of importance which would be denied to precisely the same sign in another part of the chest, even though existing there with a much greater degree of severity.

Confining our attention for the present to the evidence afforded by irritation of the pulmonary tissue, I observe that the irritation of tubercle is capable of producing all forms of inflammation connected with the lungs. Pleurisy is a general attendant upon phthisis, especially in its further stages; pneumonia less frequently, though, in the early stage of the disease, there can be no doubt that some degree of local pneumonia frequently exists, and that this is one of the causes of the consolidation to which I have already adverted. It is only in this manner that we are able to explain the very marked variation which the early signs of consolidation in phthisis will often undergo within a short period of time.

But by far the most important, because the most common and most significant, form of pulmonary inflammation, which attends the deposit of tubercle, is bronchitis. Now, the bronchitis of early phthisis possesses two special characteristics which distinguish it from the ordinary forms of the disease, and render its presence a most important diagnostic mark. First, it is mild, often so mild that, under any other circumstances, it would attract little of our attention; the kind of breathing which belongs to it is often spoken of as being merely rough or creaking, or accompanied with some degree of crepitation. And I may here remark that, in examining the chest for phthisis, as indeed in all other cases, it is important for you to observe the rule of separating in your mind the breath-sounds from those sounds which are adventitious—*e.g.*, the crepitation and

other signs of bronchitis: you will thus compare correctly the breathing, as modified by the consolidation, with the added sound which indicates the bronchitis.

The second characteristic of tubercular bronchitis is its persistence, and its being localised in a particular part of one or both lungs. Local bronchitis is always a most suspicious sign, because it indicates local irritation. The ordinary causes of bronchitis, such as cold and poisons in the blood, affect both lungs alike, and the whole of both lungs; hence, when we find bronchitis confined to a limited portion of a lung, we are led to suspect the presence of some source of irritation seated in that spot; and, of all possible causes of irritation, tubercle will be the one most likely to be present.

You must, however, observe that bronchitis is by no means a necessary attendant of tubercle in the lungs; and that, consequently, its absence is no positive evidence against the presence of that disease. The presence or absence of bronchitis in phthisis is often dependent upon accident, upon exposure to cold, hard living, bad diet, etc.; often it depends upon peculiar sensitiveness in the nervous constitution. But there is one circumstance which may be cited as operating more powerfully than any other in determining the occurrence of bronchitis in phthisis: I mean the degree of rapidity with which the tubercle is deposited. The more rapidly the deposit takes place, the greater is the probability that bronchitis will be present; and precisely the same remark applies to the fever of phthisis.

Now I wish to remark, that it results from what I have said, that there is nothing peculiar nor special in the bronchitis of phthisis, *regarded as bronchitis*, to distinguish it from any other form of the disease. The bronchitis itself is the same, under whatever circumstances it is developed; but in phthisis it derives its significance solely from associated circumstances. Strip it of these adjuncts, and you lose all means of distinguishing its peculiar cause, save by certain characters of the expectoration, to which I do not wish to refer at present. Nor is tubercular bronchitis at all peculiar in this respect. The truth is, that our diagnosis, in most forms of disease, is founded upon a few leading signs much less frequently than a casual recollection of the mental operation employed would lead us to suppose: such signs may have attracted the principal share of our attention, and we may have been led by them to form a very just suspicion as to the nature of the case with which we have to deal. But it will often appear that we have really employed the process of comparison to a much greater extent than we might have imagined. It is only when the means of instituting such a comparison are taken from us, that we learn how much we really depend upon them for assistance.

This is precisely what occasionally happens in phthisis. In certain cases, tubercles are deposited very rapidly, and at the same time very generally, being disseminated in small isolated granules throughout the entire of each lung. As a consequence of the rapidity of their development, bronchitis is set up; and because the deposit of tubercles is general, the bronchitis is general also. Moreover, as there is no aggregation of tubercles in any particular spot, none of the evidences of consolidation are presented. Here, then, the adjuncts to the bronchitis are want-

ing; and the case presents only the characters of one of general bronchitis. It is only as the disease goes on without showing any disposition to abate, and as other symptoms of a constitutional and local character are superadded, that you are enabled to assure yourself with certainty of the true nature of the case. I may, however, observe, that the difficulty in diagnosis affects chiefly adults, since persistent general bronchitis occurring in children is of itself strong evidence in favour of the presence of tubercles in the lungs.

The following example will illustrate the extent to which a case such as I have described may be deprived of the indicative circumstances so necessary for its diagnosis.

It occurred in the person of a young lady whom I attended with a surgeon in this town. Her age was 9. She was the last surviving member of her family, all her sisters having been cut off by consumption. Her health had been excellent up to the day of her fatal illness, which commenced as an ordinary attack of continued fever, entirely without any chest-complication. At the end of a fortnight, she seemed to improve, and her fever subsided; but it returned in two days afterwards with increased severity, and now was attended by evidence of irritation within the lungs, afforded by the presence of crepitation throughout the chest. It was at this time that I first saw the patient, and the remainder of her illness comprised only the short term of nineteen days. Her symptoms were those of high feverish reaction, without delirium of importance until the close of the case. Perspiration was present at times during the day, and sometimes was profuse; at night, the skin was dry and hot. The pulse at first was 120; respirations 60; but each afterwards rose to 180 and 70 respectively. General crepitation continued throughout the chest; but there was neither local dulness nor prolonged expiration; yet there was very little cough; and, as she swallowed her expectoration, it was probably in small quantity. As the disease progressed, the lips became livid, hæmoptysis occurred, and delirium set in. I was not able to obtain an examination of the body; but, as the case developed itself, no doubt could be entertained that the bronchitis, which was the only disease present to our observation, depended upon a special cause affecting the entire lungs, and that such cause consisted in a general formation of tubercle.

I may just add, that Dr. Evans, who saw the patient with us, mentioned to me a very similar case which had occurred to himself, in which also phthisis ran an acute course without any cough at all, although the physical signs of bronchitis were present throughout.

In the cases of which I now speak, the tubercles are deposited rapidly; and the progress of the case is usually rapid in proportion, though rarely so rapid as in the instance I have just detailed. Hence these cases are termed acute phthisis; and, as I shall mention to you immediately, other difficulties may arise in the diagnosis than that of distinguishing the case from one of pure bronchitis.

Precisely the same remarks which I have now made in relation to the bronchitis of phthisis apply also to the fever which accompanies the deposit of tubercle. As is the case with bronchitis, the liability to fever may depend on extraneous circumstances; but most generally it depends on the degree of rapidity with which the tubercles are formed. Hence the serious significance of a feverish attack in one

suspected to be disposed to phthisis. The history of many consumptive patients is made up of a succession of apparently trivial attacks of fever—attacks which, in another individual, would hardly be thought worthy of special care.

After such an attack, you will commonly find your patient's health occupying permanently a lower level; and you may be assured that the constitutional reaction has been the outward evidence of an addition having been made to the disease already present in the lungs.

But it is a very important circumstance, that, like bronchitis, there is nothing in the fever of tuberculosis which of itself distinguishes it as belonging to that disease; its connexion is determined by collateral circumstances. The remark I made in respect to bronchitis, that we use comparison in forming our diagnosis far more largely than we perhaps imagine, is especially true of fever; and, as fever is so common an occurrence, and attends so many different maladies, the possession of means for instituting such comparison is of still greater importance than it is in the instance of bronchitis. We are sometimes left with the fever as our only guide, and are then forcibly reminded of our need of further help.

I attended a little boy, aged 6, with one of the most experienced surgeons of this town. His illness lasted for eight weeks; my attendance comprised the last week only. His sole symptom was persistent feverish reaction, though with scarcely any delirium; the one single symptom of a local character was constant rapidity of breathing. The child's chest was searched over and over again, both by my colleague and by myself, for any indication of disease; but, to the very last, percussion was normal; not even a wheeze could be discovered; and there was entire absence both of cough and of expectoration. Death was rather sudden—I suspect, from fainting. On examination, both lungs were positively filled with tubercles.

Not long afterwards, a second case, precisely similar as regards the entire absence of every symptom referable to the lungs, came under my care, also in consultation; yet the lungs were occupied by tubercles in every part. Here, however, there was inflammatory softening of the central parts of the brain; and symptoms of cerebral disease were prominent. Close attention was, however, bestowed upon the condition of the chest, for the purposes of diagnosis.

These instances exemplify another form of acute phthisis, in which, from the absence explanatory indications, the fever at the outset of the disease is apt to be mistaken for typhoid fever.

But, after all, it is not of very frequent occurrence, that we are unable to diagnose the fever attendant upon the deposit of tubercle in the substance of the lungs, thanks to the assistance we mostly derive from the employment of auscultation and percussion. There is, however, another organ in which tubercles are liable to be produced, at least at an early period of life, and sometimes also in adult age, to which we have no means of applying physical examination. The cerebral membranes are often the seat of tubercle in childhood, and give rise to a most fatal affection. But the affection is also of a most insidious character. In the early stage of the disease, no characteristic symptoms of cerebral disorder develop themselves; the fever which attends the formation of

the tubercles is alone present. Here there are no physical signs to aid us; and the diagnosis of the disease, previous to the setting in of decided cerebral symptoms, is confessedly a matter of great difficulty. "A few years ago," says Dr. Wilks, "I collected a large number of cases of this affection in children, and in none of them was a correct diagnosis made during the first few days of illness, the case being styled one of fever or stomach-disturbance; and this error of diagnosis, or rather want of appreciation of the real nature of the case, is the rule." Dr. Wilks, however, draws attention to one distinctive characteristic, which may serve to arouse a suspicion as to the true cause of the fever; and I am sure that his observation will be found correct. He notices the irritability of the patient in the fever of acute cerebral disease, which contrasts in a most marked manner with the torpor of the fever-patient. When the disorders "are at their height," he observes, "and the patient is extremely ill, the fact is often very striking: the one with the inflammation of the brain being distressed by the slightest movement; it is irksome for him to be spoken to; he coils himself up in bed; is peevish, and wishes only to be left alone . . . whereas a patient with fever generally suffers nothing, and he evinces no trouble or alarm when touched."

Were we but able to apply to the brain the same method of physical examination we employ in cases of disease of the lungs, no doubt the proportion of doubtful cases of this disease would be reduced to the smaller proportion observed in the instance of pulmonary tubercle.

SALE OF A MEDICAL COLLEGE. The medical college property of Castleton, Vermont, whence two thousand young doctors have been sent, has been sold, and will be known as a medical college no longer.

DONATION TO BELFAST HOSPITAL. A gentleman, who desires that his name might not be published, has handed to the Treasurer of the Belfast Hospital the sum of £2000, to be expended as Drs. W. MacCormac, Pirrie, and Murney, with the Treasurer, might think best. It has been decided to erect a wing.

EARLY BAPTISM. An inquiry was recently held respecting the deaths of two children—a boy and a girl. Mrs. Knight was delivered of three children, the two deceased and another girl. They were fine children, but there was no doctor or midwife present, and the boy died almost immediately. At ten o'clock the same morning Mrs. Knight sent the two surviving children to a Roman Catholic chapel. The witness added, "We wrapped the two girls up, and when we got to the chapel the clergyman came to her and unwrapped the child she carried, and said, 'Oh, it is gone!'" It was dying or dead. The other child was christened. It was a cold day. Dr. J. S. Belcher said that the three children were healthy, considering that they were a triple birth. The deceased girl died from exposure to the cold. The boy died from want of artificial respiration being resorted to,—in fact, from want of skilled attendance at birth. The jury returned a verdict "That the deceased female child was found dying and did die in a Roman Catholic chapel from the mortal effects of exposure through being taken out so soon after birth, and that the deceased boy died from exhaustion from the absence of skilled assistance at birth." The proceedings then terminated.

Original Communications.

ON THE PHYSICS OF DISEASE, AND THE PHYSICAL PATHOLOGY OF THE BLOOD.

By BENJAMIN W. RICHARDSON, M.A., M.D., Senior
Physician to the Royal Infirmary for Diseases
of the Chest.

CHAPTER II (continued).

*Conditions of Oxygen that Modify Combination with
Blood. Oxygen as affected by Electricity. Active
Oxygen:—Ozone.*

WHEN oxygen gas is exposed to various electrical states, it assumes, I had almost said new forms, it is so singularly changed in respect to its capacity for combination. On one side, it may be made almost as irrespirable as chlorine; and on the other side, it may be reduced to the nearly negative condition of nitrous oxide. In the common air, it exists in a medium between extreme activity and negation, as a general rule; but the rule has its exceptions, and upon these exceptions much depends having relation to disease. There are times when active oxygen is present in the air, for given periods—"the ozone periods" of Moffat. There are times when, in rooms at all events, the oxygen is to an extent negative, in so far as the oxidation of blood is concerned.

I am not certain that the use of the terms, *active*, *neutral*, and *negative*, as applied to oxygen under various conditions of electricity, are really correct or good terms; because, in truth, heat also makes oxygen negative, neutral, or active, as electricity does. Oxygen reduced to very low temperature is, as we have already seen, negative in reference to the support of life; oxygen at ordinary temperatures sustains life best; and oxygen at elevated temperatures causes an over-active animal combustion. But custom has willed it, and I suppose custom must have its way, that the terms active, neutral, and negative, shall be made to apply to oxygen as existing only under differing electric states.

That oxygen should be influenced by electric force as well as by calorific force, is not difficult to understand, if it be remembered that, in fact, the two forces are one. When electrical discharge occurs in oxygen, it puts the molecules of the gas into active motion, and their affinity for other bodies with which they are brought into collision is increased. As, by the lightning flash, great waves of the atmospheric sea are put into motion, and thunder is the result, so, in the more minute divisions of that atmospheric sea, in the molecular divisions, whenever there is electrical discharge, great waves are put into active motion, the effect of which is exhibited—the conditions being supplied—in the more active combinations that occur between oxygen and oxidisable matter.

To prove that the two forces—heat and electricity—are the same in respect to oxygen, I may state that oxygen, heated to a temperature of 480° Fahr., ceases to be influenced by electrical discharges. To use the term common in experiment, oxygen cannot then be ozonised; this simply means that, after a time, the motion imparted by the heat is itself so great that the effect of the electrical discharge becomes unimportant. In the opposite scale, oxygen reduced to a very low temperature is not less inert

because it is present as negative oxygen; which means that, when inertia and condensation are produced by extreme abstraction of heat, the reduction of the electrical motion is not of moment.

It is well to bear in mind these analogies of action between the forces of heat and electricity; but with this remembrance it is also well to hold in distinct recollection the actual influence of electricity on oxygen, both in the simple state and as it is diluted in atmospheric air. To this part of our labours we will at once proceed.

To begin with active oxygen or ozone, we may produce it by several processes: *a*, by the manner in which we make oxygen, or rather evolve it, from bodies with which it had before been in combination;

b, by the slow decomposition of water, whereby the oxygen is set free; *c*, by the exposure of phosphorus to air in the presence of water; *d*, by electrical discharge.

For practical purposes, the production of ozone is best carried out by electricity. In the experiments which are about to be related, a large frictional machine was usually employed in cases where the quantity of ozone required was small, and an apparatus invented by Siemens in cases where the quantities required were large. With the ordinary electrical machine, all readers are familiar; but as few are acquainted with Siemens's ozonometer, I have had a drawing made of it, as it is seen in operation ready for a physiological experiment.

In this apparatus, the electric discharge is obtained by means of a large induction coil. The coil, as represented in the diagram (B), is a Ruhmkorff's, having four miles of wire, and being worked by three cells of a Grove's battery (A). A spark of two inches, which answers every purpose, is thus easily obtained. The ozonometer (C) consists of two conical glass tubes, the outer one having a bore of three inches at the widest part, and the inner one a bore of two inches. The inner tube is covered on its outer surface with tinfoil, and the outer tube is covered in the same way. The whole represents an elongated Leyden jar. When in action, one pole leading from the induction coil is attached, by means of a platinum wire, to the tinfoil on the outer surface of the inner tube of the ozonometer, and the other pole is attached, by the same means, to the tinfoil on the outer surface of the external tube. When electrical discharges are made, the sparks pass from the outer tinfoil through the glass to the tinfoil of the inner tube. Air, or oxygen, being now passed between the two tubes, becomes ozonised, so long as the coil is in action, and the ozonised air can be collected at the small extremity of the ozonometer. The air can either be driven through the ozonometer with bellows, or drawn through with an aspirator. In the diagram, a large gas-holder (E) acts as an aspirator.

By means of this apparatus, ozone can be applied either by being collected in suitable vessels, or by being used in a current through a chamber. The method of using it in current for experiments on animals was first introduced by Dr. T. Wood. In the diagram, the apparatus is shewn as fitted up either for a current or for collection. The chamber (D) may be so arranged, while holding the animal, as to receive a stream of ozonised air, which enters by two openings at the side near the bottom, and escapes at the top by the tube (F), where it may be collected for analysis. Or the chamber may be adapted so as to receive from time to time certain measured quantities of ozone: for this purpose a plan, invented by myself, is used: a graduated cylinder (G), which can be filled with ozonised air, fits into a tube in the chamber; the cylinder is supplied with a well fitting piston, and the ozone, by the depression of the piston, is driven into the chamber as may be required.

In experimenting with ozone, it is necessary for the operator to proceed with caution, so as to protect himself from the danger of long inhalation of ozonised air. When ozone is being produced by means of Siemens's ozonometer, it is next to impossible to prevent diffusion of active oxygen through the apartment, and in a very short time the effects are manifested on the body. The inhalation of ozonised air, even

when I can scarcely detect its presence by the odour, produces in me, after a time, intense headache and pulsation. If I breathe it a few times from the ozonometer, it creates irritation of the lining membrane of the nasal cavity, and distinct injection and soreness of the throat.

One other little matter of fact in respect to the carrying on of experiments should be carefully noted. It is useless to attempt to carry the ozonised air through India-rubber tubing of any kind, or through gutta percha, for both these forms of tubing are destroyed by ozone as they would be by heat. The ozone should therefore be passed through glass tubes, and the connections, which ought to be as short as possible, must be made by quills cemented in with sealing-wax varnish. This excellent contrivance for joints is by Dr. Wood.

In considering the action of ozone on animals, I commence with the simplest experimental position, viz., the influence of electric discharges on pure oxygen which an animal is made to breathe; and if the reader will not weary in following the narrative, I will lead him to as perfect a knowledge as I can of all the facts. Up to the present time no systematic inquiry has been carried out on this subject; but records of numerous experiments, mostly reported second-hand, are scattered abroad. I shall not dwell on these experiments, but shall detail my own simply and solely, placing them forward in such manner that any one may with ease repeat them, and reject or confirm them.

On pure oxygen at a temperature of 55°-60° Fahr. faint electrical discharges, creating ozone in quantities just sufficient to be appreciated by the sense of smell, give such motion to the oxygen as enables it to support life, after the same manner as an elevation of temperature. I took two large mice, and placed one each in a chamber containing oxygen at 55°. The chambers were of the same size, and the oxygen was from one source. When the animals were in their respective chambers, the chamber containing one of them was so placed that sparks from a pointed rod of a frictional electric machine could be discharged into the gas. The chamber containing the second animal was placed in the same temperature, but was not connected with the machine. At the end of two hours, the animal in the simple oxygen was comatose and was breathing with difficulty, while the other animal, breathing the ozonised oxygen, was moving about and breathing rapidly but freely. Two hours later, the animal in simple oxygen was dead, and half an hour later it was rigid from rigor mortis: at this time the animal in the chamber into which the sparks were passing was sleepy but living, and so it continued to live for an hour more, when, on removal from the jar, it speedily recovered.

In another experiment, an animal in an oxygen chamber at 55° was placed in communication with an electrical machine, so that the air could be ozonised. At the same time, a similar animal of the same weight was placed in an oxygen chamber of equal size, and was removed to a temperature of 70°-75°. The animal in the ozonised air lived on for nine hours, until, in truth, I was tired of working the electrical machine; the animal, merely exposed to a temperature of 70°-75°, was then also alive. The animals, on being removed from their chambers and brought into the air, were semi-comatose: they both readily recovered after removal.

We may thus consider that heat and electrical force exert an analogous action upon oxygen; but, in watching the last-named experiment, I was wonderfully struck with the power I possessed over the oxygen by the electrical spark: I held as it were the life of the animal in my hands, and by the rotations of

the electric wheel could quicken or reduce the respirations at pleasure. If I surcharged the gas, discharging the sparks rapidly, the animal began to breathe with immense haste; if I held back the motion for a long time, then the animal fell into a low comatose state, and would soon have died, had not motion been imparted again to the molecules of oxygen.

I performed another experiment by placing two animals (mice) of the same weight in chambers of equal size. One chamber was charged with oxygen in the form of ozonised oxygen, the jar being saturated with ozone: the other chamber was charged with simple neutral oxygen, and both animals were placed in a temperature of 60°. The animal in the ozone commenced at once to breathe very quickly, became comatose in an hour and twenty minutes, and died in two hours and forty minutes. The animal in simple oxygen also became comatose in an hour and twenty minutes, but it continued to live for four hours and forty-two minutes.

In this experiment we witness the effect of ozone as applied by the animal at once. The heat in this experiment was sustained throughout uniformly, and the animal that was subjected only to the motion produced by the heat lived long; but the animal that was at first subjected also to the motion added by electricity lived at first too rapidly, and the added motion, not being sustained, it died more speedily.

Next week I shall continue the record of these researches on ozone; but, before I conclude now, I would point out a fact which appears to my mind of much moment. This is, that animals are not all equally affected by oxygen. As I shall show, carnivorous animals are soon made to feel the effects of ozonised air; it induces in them so-called inflammatory states, and kills with comparatively quick action. But herbivora, such as rabbits, will live in it for long periods with little injury. It is as though those animals which live altogether on the vegetable world, and which prepare food so derived for the carnivora, do not, in active oxygen, oxidise so readily as the carnivora. I will not dogmatise on this point, but submit the evidence. If the evidence is satisfactory, it will stand without dogma, and will throw a flood of light over a region heretofore unexplored. It will show why diseases communicated from the carnivora to the herbivora change in form; why variola, for instance, in man, is vaccinia in the cow; and why some diseases are only communicable amongst special classes of animal life. For if disease be, as I have said, nothing than the phenomena of perverted motion; and if, in differing classes of animals, there be a special oxidation or generation of motion natural to them,—then must the phenomena of disease differ according to the class of animal through which it is presented.

CASE OF OCCLUDED VAGINA: RETAINED MENSES: OPERATION: CURE.

By W. J. TUBBS, M.R.C.S. Eng., Upwell, Cambridgeshire.

SARAH H., aged 16, residing at Outwell, had always enjoyed good health, with the exception of the usual diseases incidental to childhood. Her mother stated that, when the patient was two years old, she suffered from pain in micturating, and had a copious discharge from the vulva; that she brought the child to me, and had some black wash, and was ordered to poultice the parts. In the course of a week or two, the child was quite well.

About the middle of May last, the patient walked to Emsworth, a distance of four miles, and, as she

was returning, ran behind a cart for a distance of about a mile and a half. Within five hours of her return home, she complained to her mother of great pain in the right side of the lower part of the body. She continued to have pain at intervals for the next two days, after which I was requested to see her. I found, on my arrival, that there was pain on pressure in the right iliac region; pulse 80; no heat of skin; bowels constipated. She was ordered to have a saline anodyne draught every four hours, and to have a belladonna liniment rubbed over the abdomen. Next day, I found all the symptoms better; and, after remaining in bed a couple of days, she returned to her place, where she continued but a short time, owing to a return of the pain compelling her to leave off work.

She returned home about the end of the next month. I was again called in; and, on June 28th, discovered a circumscribed tumour just above Poupert's ligament. Her symptoms since I last saw her had become more urgent. She complained of "gnawing pain" in the bones of the back, hips, and thighs. She had no sickness at first, but had been very sick every day lately, most commonly when she was lying down. The bowels acted with great forcing, sometimes as often as five or six times a day; but without much effect. She had pain in the mammae on the 27th for the first time. The tumour did not move with change of posture. I recommended her to see Dr. Lowe of Lynn, whose report of the case I append.

"Examination by palpation discovers a small, firm, immovable tumour in the right iliac region, dull on percussion, semi-fluctuating. By vagina, the hymen is found imperforate, very rigid, bulging; fluctuation is very distinct on pressure being made alternately on the abdomen and hymen. Retention of the menses was diagnosed, and an operation for their evacuation by division of the hymen recommended."

On her return, I proposed to operate at once, to which she assented. On June 30th, I called upon Dr. Gache, who was on a visit to one of my patients in Upwell; and requested his assistance. We returned immediately; and, having placed the patient in the lithotomy position, I passed a full-sized trocar through the tense bluish-white membrane which was bulging between the labia; Dr. Gache at the same time making pressure on the tumour. We were gratified at seeing a chocolate-coloured grumous fluid issue from the cannula, to the amount of three pints. After thoroughly washing out the vagina with warm water, we left her, she feeling greatly relieved.

July 1st, 10 A.M. She had had a good night: no pain; pulse 76; free discharge through the wound, of the same colour and consistency as at first. A great quantity had also passed during the night.

July 2nd. She was going on well. The discharge was less in amount, and thinner.

July 3rd. There was no pain. She looked pale, and had a rapid feeble pulse. She was ordered to have half an ounce of brandy every four hours in arrowroot, and the following mixture.

℞ Quinae sulphat. gr. viij; acid. sulphur. dilut. ʒ j; magnesiae sulphatis ʒss; tincture hyoscyami ʒij; aquae ʒviij. Misce. Fiat mistura.

An ounce to be taken every four hours.

July 4th. She had had no pain, and felt much better. The bowels had acted freely. The discharge was now like thin blood. She was ordered to keep a pledget of lint as usual in the wound, and to remove it, if it gave pain; and to continue the quinine mixture.

July 5th. She was going on well.

July 8th. On visiting her to-day, I found her so well that I allowed her to sit up.

She has now been under my observation six months since she was operated on. Occasionally, there has been a purulent discharge from the vagina, for which she has used a tannin and alum lotion. She returned to service shortly after the operation; and, within a fortnight of doing so, menstruated freely for the first time. The catamenia continued for three or four days, rather profusely at first; and have returned at regular intervals since. She wrote to her mother the other day, saying she was quite well.

RETROSPECTIVE NOTES ON OUT-PATIENT PRACTICE.

By C. M. DURRANT, M.D., Physician to the East Suffolk and Ipswich Hospital.

[Continued from page 61.]

5. *Hypochondriasis*. Hypochondriasis is a disorder of by no means infrequent occurrence among our agricultural population. The treatment, which should consist chiefly of moral measures, must otherwise be influenced by the nature of the case. To laugh unsympathisingly at a hypochondriac insures, in all probability, two results; viz., the confirmation of his nervous ideas, and the loss to the practitioner of his patient. In one case, the existence of oxalates was detected in the urine; and the nervous depression succumbed speedily to the nitro-muriatic acid, with small doses of opium. This should teach us not to overlook the condition of the urine.

6. *Hysteria*. This Protean affection is, of course, to be found every where. Moral treatment, with the encouraging prospect of a happy termination, will often alone effect a cure. Invaluable as are tonics in many cases, nevertheless, if they are prematurely given (which I have often seen), at the expense of the digestive organs, much harm, and a certain prolongation of the complaint, will ensue.

Hysterie aphonia has occurred in a few cases. A blister to the nape, and quinine, with a firm, cheerful assurance that the voice will be regained, will be found to do good. If this fail, galvanic electricity, applied to the inferior laryngeal nerve and crico-thyroid muscle, has been recommended; but of this I have no experience.

7. *Paralysis*. Two cases of hysterical paralysis have presented. In the one, the loss of motion was confined to one arm; the other was incomplete hemiplegia. Both cases did well under tonics; but in one the addition of a blister to the nape, and the use of galvanism, were had recourse to.

The other cases were of a more severe character, and depended, apparently, upon commencing cerebral disease. These derived considerable benefit, however, from the carbonate of ammonia, with bichloride of mercury, and counterirritation to the nape of the neck.

8. *Spinal Congestion*. Two cases, which I have thus denominated, applied as out-patients. In both, the early symptoms were similar: slight pain over the lower dorsal vertebrae, not increased by pressure or by percussion; numbness and tingling in the lower extremities; imperfect power of progression; difficulty of micturition, alternating in one case with incontinence; and great torpidity of bowel.

The slighter case was treated as an out-patient, by a blister applied to the spine, and ergot of rye, with belladonna internally, and afterwards iodide of potassium. This case recovered.

The second was not so fortunate. He was admitted as an in-patient, and for a time improved

much under a similar plan of treatment, so that he could walk very fairly. He had, however, a relapse, the cord itself becoming probably implicated; and, although I have lost sight of him, I fear that he has become more or less permanently paraplegic. The lining membrane of the bladder in this latter case, as felt by the sound, was greatly hypertrophied and thickly corrugated.

9. *Convulsions.* Two cases stand upon the list under the name of fits and convulsions. These occurred in children, and in both instances depended upon cerebro-spinal excitement, originating in intestinal irritation. Calomel and scammony, with saline medicine, in each case effected a cure. In one, a small blister to the nape was had recourse to in addition.

RESPIRATORY SYSTEM.

1. *Phthisis.* In considering phthisis as it obtains among the out-patients of any hospital in the kingdom, we shall not err, I fear, in placing it, in point of frequency of occurrence, in the first rank of diseases incidental to the respiratory organs. Starting upon the pathological fact, that phthisis, or rather tuberculosis generally, depends upon depraved nutrition; and that this condition is brought about by various exciting causes, such as cold, insufficient food (especially if it be also of bad quality), imperfect ventilation, and too little bodily exercise,—we may consider that a decided step has been gained if we are able, by judicious management, to stave off the threatened diseased nutrition, or to check at its earliest onset its insidious but no less certain consequences.

Of the various exciting causes just mentioned, I believe that none act more certainly in producing a predisposition to the deposit of tubercle, than deficient ventilation and insufficient out-door bodily exercise. These several causes acting so simultaneously and so constantly upon the daily habitual life of our poor, we cannot be surprised at the melancholy pictures of tuberculous disease to which our attention as medical men is so painfully and frequently drawn.

Acute phthisis is not a common disease among the applicants of our hospital. In the last two years, I have not had one case presenting for relief. Of the chronic forms, however, we have every variety, and every stage of the malady. As a rule, hæmoptysis occurs much more frequently among the male than among the female patients. We have had two cases in which, in addition to the general symptoms of incipient phthisis (excepting only hæmoptysis), direct physical evidence has also existed at the apex of one lung. Under treatment, this has all cleared away, showing that condensation of an apex, apparently tubercular, may exist as the result merely of a local inflammatory attack. This is important in reference to diagnosis. The very earliest detection of the depressed condition of the system threatening phthisis, in which the digestive organs play a prominent part, and in which the general and physical disturbance referable to the lungs is not detected without much and careful scrutiny, is the duty of every practitioner. Unfortunately, among our poor, the disease is too frequently established before they apply for relief; and, from the circumstances of their life, the carrying out any well directed hygienic measures is next to impossible. We are driven, therefore, to fall back upon medicine as our principal resource.

The treatment of the disease, after placing the patient in as favourable a position as possible for obtaining an improved nutrition, may be summed up very shortly.

As a counterirritant, I prefer blisters to any other forms. These should be small; and their repeated re-

application is better, I think, than keeping up a long continued depressing local discharge. In administering medicines internally, one idea must be prominently carried out; viz., the endeavour to improve deteriorated nutrition. If the functions of the stomach be faulty, the first aim should be their correction; as steel and other tonics can but do harm, if the digestive powers resist their assimilation.

Cod-liver oil is unquestionably a most valuable remedy, although there are still some practitioners who doubt its efficacy.

Iron, iodide of potassium, and in some cases quinine, with the mineral acids, are our best tonics.

Morphia at night, and, if necessary, small doses during the day, should not be omitted, if the cough be troublesome.

If night-sweats be profuse, I have found no remedy, on the whole, so efficacious as the oxide of zinc, in doses of four or five grains at bedtime; and sponging the chest with acetic acid largely diluted.

There is a spurious form of phthisis which is not uncommon, more particularly among our male patients who are advanced beyond middle life. This is depending upon a cacoplastic deposit, not tubercle, and not strictly organised lymph. It produces many of the phenomena of bronchial phthisis; but the patient lingers on, improvement alternating with relapse; and the case lasts very much longer than an ordinary one of unmixed phthisis.

2. *Chronic Bronchitis.* I have had no case of acute bronchitis apply as an out-patient during the past two years. This may be explained, I imagine, by the fact that, if the attack be severe, the patient is necessarily confined, under medical care, to his own bed; and if the disease be comparatively slight, it is regarded simply as a "bad cold and cough", and no medical assistance is sought. Chronic bronchitis does, however, obtain; but perhaps not so frequently as in the north of England and Scotland.

In the treatment of the ordinary form of chronic bronchitis, the inhalation of steam soothes and affords much comfort. Blisters to the chest, or turpentine, and internally, ammonia, with chloric ether and the spirit of nitric ether, are useful. If the propelling power of the heart be weak, the addition of the tincture of digitalis, in doses of ten minims three times a day, will be advantageous. To quiet the frequency of the cough, expectorants with sedatives will also be needed.

One case of gouty bronchitis, in its subacute form, was speedily relieved by alkalies, colchicum, and the spirit of nitric ether. In two or three cases of very chronic bronchitis, accompanied with much spasm, I have found, as a vehicle for the ammonia, a strong decoction of the common clover-hay afford much relief, particularly to the spasm.

3. *Congestion of the Lung.* The cases thus designated are somewhat numerous, and include all the instances of hyperæmia of lung-tissue which do not advance to the stage of pneumonia. Cold and insufficient food are fruitful sources of this affection, and hence the frequency of the occurrence as an out-patient's malady.

The symptoms are common to those of catarrh and the early stage of bronchitis; a flushed face, hacking cough, with very scanty mucous expectoration, tightness across the sternum, with a general sense of pectoral fullness and discomfort.

Percussion may give no result, or there may be marked flatness elicited over the greater portion of one or both lungs. Auscultation generally yields a subcrepitant rhonchus, very variable in character, receding and returning in direct ratio to the general progress of the malady.

In severe cases, the warmth of bed, and occasional

cupping between the scapulae, may be necessary. Saline purgatives, with saline medicines, ammonia, and the spirit of nitric ether, will generally effect a cure.

4. *Chronic and Latent Pleuro-pneumonia.* This affection is by no means infrequently met with in outpatient practice; and it is often one in which little, or very slow, progress is made towards recovery of lung-tissue. As this condition has been sometimes mistaken for phthisis, care in diagnosis is especially needed, lest the announcement of the more serious malady be hastily and erroneously made.

In the treatment, blisters, again and again repeated, will be called for. Internally, iodide of potassium with liquor potassæ, in large doses, will often be useful; and by those practitioners who do not entirely negative the value of mercury, except as a purgative or in syphilis, a few grains of mercury with chalk every night at bed-time may, I think, be advantageously prescribed. If the strength have failed, and indeed in most cases, cod-liver oil will be especially indicated.

A certain amount of persistent consolidation will often remain, despite of treatment, for a lengthened period; but, after many months, it may gradually give way to a restoration of fairly healthy pulmonary structure.

5. *Hæmoptysis.* Excluding those instances of pulmonary bleeding caused by tuberculous deposit, we have had one case attributable apparently to simple circulatory excitement. This occurred in a young man who had grown rapidly, but who was quite free from recognisable tubercle. The hæmoptysis was rather profuse; but it was speedily checked by dilute sulphuric acid, and he required no further treatment than the addition of quinine.

Two cases were vicarious of menstruation; and in these the hæmorrhage ceased upon the re-establishment of that function.

The third case was referrible to hysteria, arising from ovarian irritation in a married woman without family. In this case, the hæmoptysis occurred only under the excitement of coitus, and for a time was obstinate; but it was ultimately entirely checked by the tincture of sesquichloride of iron with sulphate of magnesia. Valerianate of zinc, with compound galbanum pill, was also taken at bedtime.

[To be continued.]

FACILITY IN THE USE OF THE LARYNGOSCOPE: THE INSTRUMENT IN ITS SOCIAL ASPECT.

By GEORGE DUNCAN GIBB, M.D., Assistant-Physician and Lecturer on Forensic Medicine, Westminster Hospital.

In studying the practical application of the laryngoscope, no better method can be adopted than an examination of a number of healthy persons as opportunity permits, and this might be carried out almost to an unlimited extent, until a thorough acquaintance with manipulation is obtained, necessary for the examination of the larynx in a state of disease. If a party, say of twenty healthy and intelligent persons—medical pupils, for instance—are submitted to inspection, there ought to be no difficulty in seeing the interior of the larynx in all, with an autolaryngoscopic demonstration into the bargain, in twenty minutes, unless some cause beyond control be present—such as pendency of the epiglottis, for example, which I have observed in eleven per cent. of all the healthy I have submitted to examination,

among both sexes and of various ages. The mere rapidity of examination will only prove how readily the mirror can be applied for inspecting a given number of healthy persons—indeed, I have examined fifty ladies and gentlemen within an hour; but it is hardly the kind of illustration to select for convincing the sceptical of the facility with which some forms of diseased throat may be looked at: for instance, epiglottic thickening, associated with ulceration both of it and the interior of the larynx, and probably dysphagia present. A case of this nature, far from uncommon, would much discourage those who might select it for their first essay.

Before my distinguished friend Czermak first came to London, I used to examine the throat, with some amount of success, with an oval steel mirror, which is figured in the first edition of my work *On the Throat*. But it was not until after I had received instruction from him, that I commenced examining parties of healthy persons, ranging in number from two or more to sixty, and this proved so useful for acquiring a complete control over the laryngeal mirror that I would advise others to practise it. Seeing the conformation and peculiarities of position of the parts in a state of health in a number of healthy people, will do more to impart a sound knowledge of the larynx, than the inspection of the same parts in disease. Next to this, if there be no intolerance to the introduction of the mirror, self-examination should be persistently studied, a process now well known as autolaryngoscopy.

My chief object in this short communication, is to urge those who may be sceptical as to the facility of application of the laryngoscope—and I think they are fewer and fewer every day—to look at the laryngeal mirror, firstly, as a social instrument, and employ it in their family circle amongst the young and old. An explanation beforehand of what it reveals will, amongst the young especially, create a desire to know how their own vocal cords look; and this feeling is so contagious, that even young children will surround the manipulator's chair with a very urgent request that they be not passed over. A good preliminary to this, is an autolaryngoscopic demonstration, with some vocal illustration, as the air of a song. Any one who can learn to do this will have no difficulty in examining cases of disease.

HOMICIDE BY A DELIRIOUS PATIENT. In the Berlin Charité there were four patients, suffering from delirium, fastened down in their beds. While they were all apparently asleep, the nurse left the ward, when one of them got loose and springing out of bed, seized a stool, with which he attacked the three other poor wretches. One of these he killed on the spot, another died in half an hour, and the third remains in a hopeless state.

PAYMENT OF MEDICAL WITNESSES AT QUARTER SESSIONS. At the late sessions at Athy, the barrister, Thomas Lefroy, Esq., stated that he had been in communication with the law officers of the crown on the subject of payment to medical men for attendance as crown witnesses at quarter sessions. The Attorney-General agreed with him that medical men should be paid liberally, but that there was no direct legislation on the subject; and that the matter was under the consideration of the law officers; and he was only waiting for information from England to have the question settled. In the meantime, his own view was that medical gentlemen should be paid as liberally for attendance at quarter sessions as at assizes; and he would direct that in future *two guineas* should be paid to them for each day's attendance as crown witnesses. (*Leinster Express*.)

Progress of Medical Science.

SURGERY.

SYPHILISATION. Dr. D. J. Simpson in the *Edinburgh Monthly Journal* gives a paper on syphilisation read by him before the Royal Medical Society of Edinburgh. Dr. D. J. Simpson appears to be an out and out admirer of this new remedy. But he has, we conclude from his paper, no personal experience at all of its action. The following is a short abstract of his remarks. The announcement of Auzias-Turenne, that the syphilitic taint could be removed by syphilisation from the constitution has, during the last eleven years, been verified by the experiments of M. Sperino of Turin, and more especially by those of Professor Boeck of Christiania, to whose labours we are indebted for the greater part of our knowledge of this wonderful remedy. The following is an abstract of two cases of very severe constitutional syphilis which defied the ordinarily employed curative means, but which, under the care of Professor Boeck, yielded at once to syphilisation.

CASE I. Mr. —, contracted a chancre in 1853. After the lapse of a few months, the tonsils began to ulcerate. The ulcers, however, healed up under repeated applications of nitrate of silver. Iodide of potassium was then given internally, with sarsaparilla. No further symptoms manifested themselves until March 1858, when an ulcer formed on the inner side of the right knee, which healed up after being blistered and strapped. In December 1859, the tonsils and soft palate became extensively ulcerated. No local application seemed to be of any avail in checking the ulceration, and the constitutional treatment by iodide of potassium and sarsaparilla proved equally powerless. In August 1861, the patient came to Edinburgh for advice, and was examined by several of the most eminent physicians and surgeons in that city. His tonsils and soft palate were almost entirely destroyed by ulceration. He looked quite cadaverous, and was so weak that he had the greatest difficulty in walking. His condition was the more alarming, as several members of his family had died of phthisis. He was advised to proceed to Christiania, and submit, as a last resource, to treatment by syphilisation. This he did; and arrived in Christiania on September 1st, 1861. On his arrival he put himself under the care of Professor Boeck, who commenced treatment at once by inoculating him on the chest with matter from an indurated chancre; reinoculating every third day with matter from the previous pustules. At the end of a fortnight, the patient's appetite, which he had almost lost, became ravenous. He could also walk without experiencing much fatigue. Three weeks later, inoculation failed to produce any result; the successive crops of pustules having become gradually smaller, the last proving abortive. Inoculation was then tried on the arms; and pretty large pustules followed. After three weeks' treatment, the pustules aborted here also. The patient left, *completely cured*, on December 1st, 1861, having gained three stones in weight, and expressing himself as "almost as well as he had ever been in his life."

CASE II. Mr. — was advised, in the summer of 1861, to go to Christiania and to place himself under the care of Professor Boeck, for a very severe attack of tertiary syphilis. Six years had elapsed since he contracted a chancre. In the summer of 1861, when he came to Edinburgh seeking advice, he had a large syphilitic ulcer over each tibia, and one over the left

clavicle. Perforation of the palate had taken place, and some pieces of bone had come away from the interior of the nose. The frontal bone was swelled, indicating the commencement of a corona veneris. The ulcers were very obstinate, and continued to increase in size, in spite of treatment. The patient had previously undergone a complete course of mercury on two or three occasions. He had been treated by the heads of the profession in Edinburgh, London, and on the Continent of Europe, without experiencing the slightest benefit; and, despairing of recovery, he determined to go to Christiania. So reduced was he that he had to be carried on board the steamer on leaving Britain, and from it on his arrival in Norway. He underwent a course of syphilisation; and so rapid was his return to health and strength, that within two months after the time of his landing in Norway, he was able to hunt. After an absence of three months, he returned home perfectly cured. The cure in this case was the more remarkable, as the patient was labouring under an enormously enlarged liver, which he had acquired in China, when serving there as an officer in the army. Dr. Simpson saw both of the patients whose cases have been described, immediately after their return from Christiania. Both spoke in confident terms of the treatment. Up to the present time, neither of them has had the least sign of a relapse. Syphilisation may be practised either with matter from a *soft*, or with matter from an *indurated chancre*. Most late writers on the subject of syphilis maintain that the poison giving rise to an indurated chancre is essentially different from that which causes a soft chancre; but Professor Boeck has pointed out that both forms of chancre are the result of one and the same virus. According to him, it depends only on the difference of intensity of the virus whether a soft or indurated chancre be produced. Very intense virus gives rise to a *standard soft*, less intense, to a *standard indurated chancre*. Virus intermediate in intensity to these two extremes gives rise to intermediate forms, so that our prognosis must be always extremely guarded as to whether secondary symptoms will ultimately supervene. No satisfactory theory to account for the extraordinary disappearance of the constitutional symptoms under a course of syphilisation has yet been advanced. Dr. Danielssen of Bergen, has mooted the idea that the action of the remedy is purely depuratory. In consequence of many persons holding this view, experiments were set on foot in Christiania to ascertain whether by means of irritants an equally happy result could be obtained as by syphilisation. Pustules produced by friction with tartar emetic ointment were the media employed. The committee appointed to investigate "Tartarisation" report as follows:—"The members of the committee all agree that they do not know any manner of treatment which works more efficaciously, or even so efficaciously, as syphilisation does in cases of secondary syphilis in individuals not previously treated by mercury." That the ulcers produced should be syphilitic, and syphilitic alone, seems to be the great secret of success, as is shown by Nature herself throwing off the disease by the production of tertiary syphilitic ulcers. In comparing the average of relapses after the different methods of treatment, we see that after mercury thirty-two per cent. relapse; after iodide of potassium, twenty-one per cent.; after syphilisation, only nine and a half per cent. Professor Boeck, however, since he has confined himself to inoculating with matter from indurated chancres, has not had to record a single relapse. The two modes of treatment which claim our chief attention, are syphilisation and tartarisation. After tartarisation twenty per cent. relapsed; after syphilisation only nine and a

half per cent., or, according to Boeck's last series of experiments, not one. The greatly diminished chance of relapse, as well as the possibility of arriving at a certain point of immunity where we can pronounce our patient *cured*, which cannot occur with tartarisation—as in the latter case we can produce sores *ad infinitum*—shows the superiority of syphilisation over every method of treatment which has yet been proposed. At its first introduction, discredit was brought on the practice by its discoverer, Auzias-Turenne, proposing to employ the remedy as a prophylactic, like vaccination. This, of course, is revolting to the mind of every practitioner. Moreover, syphilisation does not act as a prophylactic, as one or two cases after having been cured by the treatment have subsequently contracted a fresh chancre, which has been followed by constitutional syphilis. Nor is its employment as a remedy for the primary sore in any degree a justifiable proceeding; for we can never tell whether any chancre will be for certain followed by constitutional syphilis. But as a remedy for the constitutional disease it stands pre-eminent, for syphilisation appears capable of curing every case of constitutional syphilis. Surely, instead of being summarily rejected, as it has been in this country, the remedy is entitled to a fair and impartial trial.

ANEURISM OF THE EXTERNAL ILIAC ARTERY TREATED BY PRESSURE. Dr. T. C. Moffat relates a case of aneurism of the external iliac artery successfully treated by pressure applied in a novel way. He observes that the exceeding simplicity of the operation by compression here described, and its entire safety to the subject, should commend it, wherever practicable, to the careful consideration of the surgeon.

The case is perhaps the first of the kind which has ever been brought to the notice of the profession. The subject was suffering from an attack of bronchitis. He was an Englishman, 29 years of age. His general condition was that of robust health. He had a tumour in the right inguinal region, of about the size of a small orange, which, he said, first attracted his attention about five weeks before. It was then quite small and painless, and was attributed by him to a severe strain received in lifting. He said that it had given him no trouble, except in causing some stiffness of the hip-joint, until a week before admission, when he found that he was growing lame, that the swelling was steadily increasing, and that at times he was troubled with pains through the hip and back and extending along the thigh to the knee. On examining the tumour carefully, it was found to be well defined, lying mainly above Poupert's ligament and pulsating synchronously with the heart. The tumour appeared to involve about two inches of the artery lying over and above the horizontal ramus of the pubes, including necessarily the origin of the epigastric and circumflex ilii arteries. Several surgeons examined the case. There was no disagreement among them. It was found that tolerably strong pressure made obliquely downward and backward upon the cardiac side of the tumour arrested all pulsation in it, and that this pressure continued for a considerable time by the patient himself, by means of the apparatus described, did not cause him much discomfort. A band of India-rubber tubing of one inch calibre was passed around the patient's body, encircling the hips between the trochanters and the iliac crests. Between the rubber band and the skin wide strips of pasteboard were placed to relieve the pressure and diffuse it over a larger surface. An upright piece of wood, about one foot in length, an inch in breadth, and one and a half in thickness at the lower end, was covered with several thicknesses of chamois leather; the upper half of the upright was made quite thin in

the line of the body of the patient, and about an inch in breadth. On one side of it the notches were made half an inch apart to admit a loop of strong cord which was tied to the India-rubber band at the point where it crossed the tumour. The lower end of the upright having been adjusted upon the artery, just at the upper side of the tumour, the band was drawn up probably with a force of six or eight pounds, and the small loop above mentioned was slipped into one of the notches of the upright. The contraction of the belt constitutes the power of the pressure, the amount of which was increased or diminished in exact proportion to the inclination of the upright. This was readily changed by lengthening or shortening a cord which passed from its upper extremity to the foot of the bed. The piece was easily kept in the position required by cords running from its upper end to each side of the bed. To adjust the whole apparatus above described, required but a moment's time, and its removal was readily accomplished without disturbing the cords. The violent paroxysms of coughing with which the patient was seized at frequent intervals, were such as to render it impossible, while they continued, to maintain sufficient pressure to obliterate pulsation in the tumour. Several times during the operation the apparatus was entirely removed in order to afford temporary relief to the patient; and at such times pressure was kept up as well as might be with the thumb or fingers of the attendants. At such times it was not possible to prevent a current of blood from passing through the tumour. At the end of six hours of continuous pressure it was found that it required but little force to prevent pulsation; and to effect this it was only necessary to change the loop to a lower notch in the upright. From this time onward he lay quite still, and at the end of eight and a half hours the tumour was found to be completely solidified. The temperature of the limb, which at the first had fallen very considerably, after the first four hours began to regain its normal standard; and when the operation was completed there was no perceptible difference between the two legs in this respect. The usual precaution of wrapping up the whole leg and thigh with cotton wool was not omitted in this case. The patient was kept in bed with the apparatus applied above twelve hours—he then got up and walked about with entire ease. He left the hospital on the second day after, rejoined his ship, and sailed immediately for Liverpool. He could not be influenced by any consideration to delay the voyage in order to test the permanence of the cure. The tumour, when he left, had shrunk somewhat, was hard and entirely painless. He was able to walk afterwards, quite as well as before the operation had been commenced. Dr. Moffat knows no reason to doubt the complete success of the operation in this case, and the permanent cure of the patient. Had he been free from cough, so that the apparatus could have been kept in its proper position without difficulty, cure could have been effected in much less time. (*Philadelphia Medical and Surgical Reporter*.)

AMPUTATION AT THE HIP-JOINT. A successful case of amputation at the hip-joint is related by Dr. Fayer, Professor of Surgery in the Medical College, Calcutta. The case, Dr. Fayer says, is interesting, not only for its own sake, as an amputation at the hip-joint, but because it was a secondary amputation following that of the thigh, and performed when the patient was very low, suffering from clear indications of blood-contamination, the result of a diseased condition of the medulla, which is unfortunately frequent in India after section of the long bones, and the cause of many unsuccessful amputations. The oper-

ation was performed, and the recovery occurred, at a very hot season of the year, the thermometer ranging from 86° to 104°. Cholera and other diseases were very prevalent at the time. On April 10th, 1864, a native boy 16 years old, was thrown from a horse; at the inner side of his knee the soft parts were severely injured, but the joint was apparently unhurt; on the 12th, it was found that the joint was opened. The limb was then removed at the lower part of the thigh. After the amputation, fever and extensive necrosis of the bone followed, so that as a chance of saving life the limb was removed at the hip-joint. The knife was entered a little above and in front of the great trochanter, and emerged at the root of the scrotum. The flap being raised, the femoral artery was tied before the posterior flap was cut. On dividing the bone at the great trochanter, drops of pus oozed out of its cancellated tissue; Dr. Fayer therefore seized it with the lion-forceps and dissected it out, without loss of time. The acetabulum was healthy. All bleeding points, venous and arterial, were tied. The loss of blood was very small—less than eight ounces. His pulse, which was over 150° when the operation was commenced, was very little weaker after it was over. Stimulants were given and hot bottles applied. After the operation the patient immediately improved, and eventually recovered. The last report of him is as follows. "He goes to work regularly as a tailor, and is in robust health. He uses crutches and gets over the ground rapidly; is getting fat, and is much grown in height as well as circumference since his accident. He was admitted on April 10th, 1864; thigh amputated on April 12th; hip amputated on April 24th; perfectly cured on July 31st, 1864—just one hundred days from the operation."

INJURIES OF NERVES. A hospital for diseases of the nervous system was organised in Philadelphia in 1863; and was also opened for the reception of cases of wounds and other injuries of nerves. Thirty-one cases, illustrative of nervous derangement, some exceedingly rare, and involving separately and conjointly almost every main nerve-trunk and an infinite variety of branches, have been reported in a work on *Gun-shot Wounds and other Injuries of Nerves*, by Drs. S. Weir Mitchell, G. R. Morehouse, and W. W. Keen. Lesions of sensation, of function, of calorification, of volition, of muscular movement, etc., are described, and illustrate many obscure points of physiology and pathology.

The authors profess to treat fully of such points only as are novel, or upon which their clinical experience enables them to cast a clearer light. They describe a distinct kind of pain as a burning pain. It is a form of suffering as yet undescribed, and so frequent and terrible as to demand the fullest description. In their early experience of nerve-wounds we met with a small number of men who were suffering from a pain which they described as a "burning," or as "mustard red-hot," or as a red-hot file rasping the skin." In all these patients and in many later cases, this pain was associated with a glossy skin. They have also seen numbers of men who had burning pain without glossy skin; and in some they have seen the latter condition commencing. The burning comes first, the skin changes afterwards; but in no case of great depravity in the nutrient condition of the skin have they failed to meet with it. The seat of the burning pain is very various, but it never attacks the trunk; rarely the arm or thigh and not often the forearm or leg. Its favourite site is the foot or hand. The part itself is not alone subject to an intense burning sensation, but becomes exquisitely hyperæsthetic, so that a touch or a tap of the finger

increases the pain. Exposure to the air is avoided by the patient with a care which seems absurd; and most of the bad cases keep the hand constantly wet, finding relief in the moisture rather than in the coolness of the application. As the pain increases, the general sympathy becomes more marked. The temper changes and grows irritable, the face becomes anxious and has a look of weariness and suffering. The sleep is restless and the constitutional condition reacting on the wounded limb, exasperates the hyperæsthetic state, so that the rattling of a newspaper, a breath of air, another's step across the ward, the vibrations caused by a military band, or the shock of the feet in walking, give rise to increase of pain. At last the patient grows hysterical, if may be used the only term which covers these facts. In two cases, at least, the skin of the entire body became hyperæsthetic when dry, and the men found some ease by pouring water into their boots. One of these men went so far as to wet the sound hand when he was obliged to touch the other. Cold weather usually eased these pains; heat and the hanging down of the limb made them worse. The temperature of the burning part has been always found to be higher than that of the surrounding parts, or than that of corresponding points on the other half of the body. (*Medical and Surgical Reporter*.)

CANCROID OF THE CORNEA AND UPPER LID. At a meeting of the Pathological Society, Mr. J. Z. Laurence opened a case of cancrroid disease of the cornea and upper eyelid. The patient, James B., aged 26, was first seen at the Surrey Ophthalmic Hospital on April 22nd, 1864. From childhood he had had a thickening of the right upper lid, apparently chronic ophthalmia tarsi. The eyelid had been treated from time to time with caustics by various surgeons; and during the early part of 1863 he was under treatment at a London Ophthalmic Hospital for a "large cyst in the lower lid." The cyst was incised, he was directed to take three drops of liquor arsenicalis three times a day, and to apply sulphate of zinc drops daily to the eye. The cyst was cured, but at the end of some months the eyelid remained in precisely its previous condition. About the middle of October 1863, the patient first observed a small growth from the surface of the globe, which continued to increase in size till he applied at the Surrey Ophthalmic Hospital in April 1864. At this time, occupying nearly the whole outer half of the cornea was a soft, vascular, conical growth, measuring about four lines transversely, about three lines from above downwards, and rising a line and a half above the cornea. The greater part of the tumour appeared to spring from the deeper layers of the cornea, the smaller portion on the outer side passing insensibly into the adjacent scleral surface. Numerous vessels passed from the highly congested conjunctiva to the surface of the growth; especially one large vein from the inner side. The patient stated that he had experienced but little pain in the eye, and that the growth was but slightly sensitive to the contact of a foreign body. The portion of the cornea unobscured by the tumour was nebulous and highly vascular, and at its upper and outer part adherent to the upper lid, which was very much thickened and congested, and its palpebral surface roughened by minute fungoid elevations, like surgical granulations. The visual power of the eye was reduced to mere quantitative perception of light. On the day of his admission Mr. Laurence removed a portion of the growth with the knife; after which it bled very freely. The raw surface was then touched with the solid nitrate of silver, which was twice subsequently repeated, but eventually discontinued in consequence of the application causing most intense

pain, and apparently doing but little good. When last seen on January 17th, 1865, the eye appeared to have undergone little general change; but the conjunctiva was more vascular, the growth much larger in all its dimensions and its apex flatter, softish, uneven, and of a dirty white colour; numerous large tortuous vessels running to it, and ramifying over its surface. The protrusion of the growth between their edges prevented the complete closure of the lids. The upper lid was considerably thickened at its margin; and projecting from its under surface, moving freely upon the cornea, were two lobular fleshy growths, each measuring about a line and a half in length. (*Ophthalmic Review*.)

Reviews and Notices.

THE LARYNGOSCOPE, DIRECTIONS FOR ITS USE, ETC. Two Lectures, delivered at the Royal College of Physicians. By GEORGE JOHNSON, M.D., F.R.S. Pp. 64. London: 1864.

ON THE USE OF THE LARYNGOSCOPE IN DISEASES OF THE THROAT; with an Appendix on Rhinoscopy. By MORELL MACKENZIE, M.D. Pp. 154. London: 1864.

DR. GEORGE JOHNSON'S Lectures have already secured the attention of the profession in the pages of the *Lancet*. He has now published them in a convenient form for the more general benefit of the profession. They contain a clear exposition of laryngoscopy; and, by their aid, any medical man may, with an ordinary amount of care and attention, learn to practise laryngoscopy and rhinoscopy.

DR. MORELL MACKENZIE'S work is of a somewhat more ambitious character; and, of course, in writing it he has the advantage of having at his disposal all the latest that has been said or written on a subject, which must be considered still in its course of development. Dr. Mackenzie gives a full and interesting history of the laryngoscope. He also does full justice therein to the late Mr. Avery, who has never had awarded to him all the merit which was his due in this matter. That Mr. Avery's instrument was not left by him in a perfect state, is only saying that death overtook that persevering and excellent surgeon while engaged in its perfection. It is, at all events, no slight credit to his ingenuity, that he should have succeeded so well in working out the main point—the principle of the thing.

"Mr. Avery's laryngoscope" (says Dr. Mackenzie) "was very similar in principle to that now in use, and even in its details it did not differ widely from the modern instrument."

Dr. Mackenzie has given us all that is known up to the present moment, both of the instrument and of its capabilities. One of the most remarkable uses of the instrument is that which has enabled surgeons to remove morbid growths in the larynx. On this head, Dr. Mackenzie gives interesting details. His work is, like Dr. Johnson's, illustrated with woodcuts; but Dr. Mackenzie's contains no less than thirty figures. In the section which treats of the Application of Galvanism to the Larynx, Dr. Mackenzie details cases in which the voice was restored thereby after having been lost for two and three years. The work is well written, and the subject is systematically treated.

THE SUCCESSFUL TREATMENT OF INTERNAL ANEURISM. By JOLLIFFE TUFFNELL, F.R.C.S.I., M.R.I.A., etc. Pp. 34. London and Dublin: 1864.

IN the course of their investigations into the cure of aneurism by instrumental compression, the Irish surgeons demonstrated the value of diminishing, in place of arresting, the flow of blood through the sac. The brief treatise before us contains an account of the results obtained by Mr. TUFFNELL (and partly by the late Dr. Bellingham) in the endeavour to apply the same principle to internal aneurisms.

In the first case, an aneurism of the abdominal aorta of the size of an orange, became partially solid during three months of treatment; and the patient afterwards pursued his occupation of a hackney carman for four years and a half, with scarcely any discomfort. He subsequently died of some accident, which is not described. There is also no record of any *post mortem* examination.

The second case was one of pain and dulness on percussion, with an audible "double thump" in the left scapular region, attended with other symptoms, which were all relieved in ten weeks. This man returned to his occupation as a sailor, and did all his duties below and aloft.

In the third instance, an aneurism protruded through the chest to the right of the sternum, where it formed a thin-walled tumour, three inches in diameter, and having a double pulsation. After twelve weeks of treatment, the tumour was firm and flattened in the centre, and the beat in it was single. Three years afterwards, in 1857, the patient felt no inconvenience from the aneurism, and had resumed his work as a die-cutter. The tumour did not pulsate, and still felt firm; but it had reached the size of a small cancer; and there were indications in very extended dulness on percussion, in an audible double aneurismal beat, and in obstruction of the venous circulation, that the aneurism had much increased within the chest. There is no later account of this patient.

The fourth case, one of aneurism of the abdominal aorta, near the umbilicus, had, in thirteen weeks, the bellows murmur more soft, the pulsations less distinct, and other symptoms sufficiently relieved for the patient to return to Australia. When last heard of, he was reported to be well.

The next case, already published by Mr. Solly, was one of abdominal aneurism, which improved so greatly under treatment that the patient was persuaded by two eminent surgeons in Dublin that he had never had an aneurism at all. He resumed active life, and died suddenly, when the existence and the bursting of the aneurism were ascertained by a *post mortem* examination.

A sixth case is added, in which an aneurism, beating visibly in the epigastrium, was much reduced by three months of treatment. It could then be felt, when the abdomen was relaxed, "pulsating, with its outline hard and well defined, painless on handling and pressure, whilst the *bruit* could scarcely be heard."

The plan of treatment to which these results are attributed, though arrived at through a new principle, consists of the old and well known methods of prolonged rest in the recumbent posture, and a very reduced diet. The most minute directions are given as to the bed on which the patient is to pass many weeks, and as to the daily diet, which is only ten ounces of solid food (including three of broiled or boiled meat) and eight ounces of fluid.

Mr. Tuffnell's pamphlet appears to us of value for its clinical illustration of the advantage to be derived from rest and restricted diet, and for the preciseness of his directions for enforcing and rendering it endurable. With memories refreshed as to the many thousand beats a day by which the recumbent posture may reduce the pulse, and as to the fact that diet is capable of affecting the deposition of fibrine, practitioners may set about the treatment of internal aneurisms with renewed hope. But we confess to have been not a little disappointed in the expectations which the author has raised. His title-page promises success. The cases are selected ones to illustrate success. It is no fault of a reader that the second case has no appearance of having been an aneurism at all. The description furnished by the author would equally, if not better, apply to a deposition of tubercle in the left lung. None of the other cases were cured. Though partly consolidated, and thereby much improved, each of them continued to pulsate at the close of the treatment. The fifth patient, desisting from proper caution and care, died by the rupture of his aneurism. The third, continuing his work, had, when last seen, a great increase of his tumour. This, at least, is what we gather from the confused account of it which is given by the author. The first case is decidedly satisfactory, so far as it is related; the patient having been benefited for four years and a half. Of the fourth and sixth cases, nothing can be concluded, beyond the advantage which they obtained during, and for a short time after, treatment.

And yet it is fair to the author to state that success in the treatment of internal aneurisms can rarely reach beyond that which he has attained, and in most cases can never be complete. An aneurism cannot be reported as cured unless the artery be obliterated from which it sprung. Though filled with fibrine, it is ever liable to be again distended, and to burst at a newly expanded part. The cures of surgical aneurism are absolute, for the artery is obliterated; but such an event in the case of the aorta is impossible, except below the renal arteries. That in that part, however, the aorta may be suddenly and safely closed is now known to us by the experience of Dr. Murray, of Newcastle-on-Tyne, who, in accomplishing, with chloroform and a tourniquet, the cure of an abdominal aneurism, brought about the obliteration of the aorta itself.

ON LONG, SHORT, AND WEAK SIGHT, AND THEIR TREATMENT BY THE SCIENTIFIC USE OF SPECTACLES. By J. SOELBERG WELLS, Ophthalmic Surgeon to the Middlesex Hospital. Pp. 214. London: 1864.

This edition of his work Mr. SOELBERG WELLS has enlarged for the purpose of presenting in it a more complete synopsis of the group of diseases here treated of. These diseases—affections of the accommodation and refraction of the eye—have been hitherto too lightly considered.

"It is now known" (says Mr. Wells) "that certain forms of asthenopia and amblyopia which had in former times set all remedies at defiance, are not due, as was generally supposed, to serious lesions of the inner tunics of the eyeball; but are, in reality, dependant upon some anomaly of the refraction of the eye, or a peculiar asymmetry of the organ (astigmatism.)"

Now, by a very simple remedy—the proper use of glasses—some of these affections may be readily cured. Indeed, the author lays much stress upon the mischief which is often done by the "haphazard plan of selection of spectacles generally employed by opticians"; and insists that the surgeon ought himself to determine the number of the required lens.

In the chapter on Myopia and Sclerotic-Choroiditis Posterior, the necessity for an accurate investigation and careful selection of glasses is well brought out; and so, also, is the value of the ophthalmoscope in diagnosing the frequent presence of that affection in the short-sighted, and in the watching of its progress.

In Chapter v, we have a good account of Muscular Asthenopia, are told of its frequent occurrence, and the relief afforded by operation. The importance, again, of thoroughly understanding the symptoms and treatment of hypermetropia—a disease which often causes great distress of mind—is told in Chapter vii.

Great credit is due to Mr. Soelberg Wells for having so clearly and practically treated of what really is a very abstruse subject of investigation. The style and tenor of his book prove him to be thoroughly master of the business he has here taken in hand. His chapter on Astigmatism is a good example of his successful way of dealing with a subject difficult of ordinary comprehension.

One of the chief and most important objects of the book is, as we understand it, to point out the necessity of scientifically adapted spectacles to the case requiring them. Great injury, we learn, is often done to the sight by the present haphazard method usually followed in the matter of the choice of spectacles. On this head, and as a specimen of the author's style, we give what he says respecting the choice of spectacles in myopia.

"Care should be taken that the spectacles fit accurately, that the glasses are on the same level, and that one is not higher than the other; that they are sufficiently near the eyes, and that the centre of each glass is exactly opposite the centre of the pupil. The last point should be particularly observed in the selection of glasses which fit on to the nose by means of a spring (*pincez nez*); for we find that, on account of their oval shape, they are not generally centred; and if they do not fit properly, so that their centre corresponds to the centre of the pupil, they act as prisms, and give rise to diplopia or to squinting, and the latter may even become permanent, if their use be persisted in.

"Concave glasses should be quite close to the eye; otherwise they will diminish the size and distinctness of the retinal image. As the rays which impinge upon a concave glass are rendered divergent by it, it follows, that the further the glass is removed from the eye, the fewer peripheral rays will enter the latter, in consequence of which the retinal image is diminished in size and intensity. The reverse obtains in the case of convex glasses; for as they render the rays which fall upon them more convergent, a greater number of peripheral rays will enter the further (up to a certain point, of course) the convex glass is removed from it, the retinal image becoming at the same time larger and more luminous.

"Single eye-glasses should not be permitted; for, whilst the one eye is habitually used, the vision of the other soon deteriorates, on account of its disuse, and may become considerably amblyopic. Besides this, as only one eye receives a clear and well defined

image of the object, the other is apt to follow its own muscular impulse, and deviate in the direction of its strongest muscle, and thus divergent squint frequently arises, as the internal recti muscles are often weakened in myopia. If a single eye-glass is employed, it should be alternately used for each eye, so as to keep both in activity. It will be found, however, that spectacles afford a much more clear and well defined image than a single glass. Objects appear to stand out in far more relief, and with greater sharpness and definition, and the sense of depth and distance is also more keenly appreciated."

We cannot conclude our remarks on this work without adding a word in reference to the nomenclature of ophthalmic surgery. We remember hearing the late Sir Charles Bell, in one of his lectures in the Edinburgh University, say: "Oculists are a very learned body, if we may judge from their language." And certainly there is no special department of surgery which can boast of such a scientific nomenclature. We are not saying this as a reproach; because evidently it is better to state an idea in one word—if so it may be stated—than to use long periphrases. But we must insist on this; viz., that, if no English synonyms can be as conveniently employed in their place, authors should, for the benefit of the ordinary reader, define the exact meaning of their scientific terms. We want, in fact, a dictionary of modern ophthalmic phraseology. The profession, as a body, is decidedly not yet master of that same. How many of us are there outside the special ophthalmic body who could define "Aphakia", Asymmetry, Astigmatism, Buphthalmos, Cyclitis, Emmetropia, Epicrisis, etc.?

FUNCTIONAL DISEASES OF THE STOMACH. Part I. Sea-Sickness: its Nature and Treatment. By JOHN CHAPMAN, M.D., etc. Pp. 72. London: 1864.

In his preface, Dr. CHAPMAN says that his intention was to have favoured the profession with a treatise on diseases of the stomach; but urgent affairs have forced him to prepare the part on sea-sickness only at present. The doctor's cure for sea-sickness is the application of ice to the spine. The ice is confined in bags, which have been patented, and, as we are informed, may be obtained at all surgical instrument-makers. Of the merits of this method of cure of a very distressing affection, Dr. Chapman speaks in much higher terms than (as it seems to us) are warranted by what he calls his experiments. We sincerely trust that he has hit on a good thing; but, as calm critics, must suggest that the proof of the cure is yet to be given.

BEQUESTS. The late Miss Burton Forster, of Hyde Park Square, has bequeathed to the Charing Cross Hospital £1,000: and the late Miss Ellis, of Balham, has left to the Blind School, St. George's, Deaf and Dumb Asylum, Old Kent Road, Royal Free Hospital, and the Asylum for Idiots, each a legacy of £100.

OVARIOTOMY. Dr. Pirrie, Physician to the Belfast Lying-in Hospital, last week performed the Cæsearean section. The child is alive, but the poor woman, who before her admission to hospital had been four days and nights in labour, died. This is the second instance of this operation in Belfast, the first having been performed twenty years since by Dr. McKibben.

WE beg to remind the members of the Association that the annual subscription is now due. Payment of the same can be made either to the Honorary Secretaries of Branches; or to the General Secretary, T. Watkin Williams, Esq., 13, Newhall Street, Birmingham.

British Medical Journal.

SATURDAY, JANUARY 28TH, 1865.

DR. STOKES ON MEDICAL EDUCATION.

IN a discourse delivered at the opening of the present session of the School of Physic in Ireland, Dr. Stokes took occasion to speak of medical education. Dr. Stokes deplors the inferior position which the medical profession holds in relation to other professions; and he sees the cause of this inferiority in the defective primary education of the medical student.

"Medical corporations, and that class of universities which, by ignoring the value of an education in arts to the medical student, are really little more than faculties, have confounded instruction with education, have placed the special training as first in importance, often to the total neglect of that enlarged education, which would enable their members to advance the real interests and support the true rank of a liberal and a learned profession."

The Medical Act, Dr. Stokes says, has done nothing towards elevating the social rank of the profession. Its promoters had in view the securing of the material interests of the craft, rather than the promotion of the position of medicine. In this Act (as amended), we find seventy-seven clauses, but only five which relate to education; and of these five, three are so worded that it is doubtful whether or not the Council has any power to interfere with extra-professional education. The two other clauses relating to professional education, were introduced "for the protection of the most miserable quackery that ever soiled a noble calling."

At the time of the passing of the Medical Act, there were no less than nineteen bodies which had powers to grant diplomas; and of all these, three only essayed to give to medicine its proper position of equal rank, in an educational point of view, with divinity and law; viz., Oxford, Cambridge, and Dublin. Now, as there are upwards of 18,000 medical practitioners on the *Register* of 1864, and of these only 541 hold the degrees of those Universities, it follows that "only three per cent. of the entire profession has received that university education which places the members of the learned professions—in England and Ireland, at least—on terms of social equality in an educational point of view." And then again, of the three Universities referred

to, only two—viz., Dublin and Oxford—refuse the medical degree to all who have not taken the degree of Arts.

“Cambridge, by admitting to her degree on a less amount of education, has strengthened the opinion that medicine is to be looked on as inferior to her sister faculties. This should not be. No diminution in the amount of arts education—not the fractional portion of a term—should be allowed. It is the bounden duty of the old universities to look more to the character and social status of their graduates than to their mere numbers. In Oxford, the time of obtaining the degree is, in my judgment, too remote; in Cambridge, the objection is of another kind.”

Dr. Stokes then describes the deplorable results (as he sees them) of this defective education.

“The system, in truth, was, and is, in most cases, deplorable. A young man, often little more than a boy, is sent from his parents’ roof, and plunged into a medical school in a large city. As to discipline, there is none for him; as for example, he has that of his fellows. There are none to care for him. He may degrade himself to the last extreme. After a time, one idea takes possession of him, how he may best obtain his diploma; and so he resorts to the crammer, under whom he remains until his fourth year of mispent time is past; and then, with crowds of other victims, he is turned out to commence his professional life, ignorant even of his own business, with his observing and reasoning powers uncultivated, his moral sense necessarily blunted, his tastes unrefined, his literary attainments (if he had any) forgotten. Unfitted by his habits for independent thought, he enters on practice; and what wonder if he occupies an inferior place in society, when he finds, too late, that he wants that mental culture which would enable him to support the position of a gentleman, or the dignity of a profession?”

“As the result of this system, large numbers of uncultivated men have been, and are still, admitted into the profession; and here is the cause which produces the evil of an inferior relative position, an evil of such magnitude, that were it not for the good and purifying influences of medicine itself on the character of those engaged in its ennobling work, the consequences to society would be deplorable.

“It was in reference to this state of things that the resolution of Mr. Teale was adopted by the Medical Council, to the effect that no degree in Medicine should be conferred on any one who had not received the degree of Bachelor of Arts, or who had not gone through the university education for that degree, or received an education equivalent to that necessary for the degree. Mr. Teale is no longer a member of the Council, and his loss is a great misfortune to the cause of professional progress.”

Dr. Stokes earnestly calls upon the Universities to put an end to this deplorable state of things; “to follow the examples of the old Universities of Bologna, of Paris, and of the still older University of Salerno, in all of which the study of philosophy was made inseparable from that of medicine.”

“Let the Universities unite in one noble brotherhood, and, looking at their great mission, think less of the numbers than of the mental training of their graduates, less of special instruction than of full education, and so further that system which has been the mainspring of England’s greatness, because the nursing mother of her intellect and her civilisation.”

With regard to the special medical education of the student, Dr. Stokes, we are glad to see, deprecates attendance on the number of lectures which at present form a forced part of his curriculum.

“The system of professional education, in all schools, requires a careful revision; and there can be no doubt that the number of lectures which the student is compelled to attend is excessive, and constitutes really a great evil. This evil might be mitigated by making attendance compulsory only on those courses which are essentially demonstrative. Or, again, the actual number of lectures in each course might be profitably diminished. As to examinations, they should be so conducted as to be essentially practical, and thus to diminish the great evil of cramming. I am myself not an advocate for the necessity of examination in all cases; for year after year we meet with men who might safely be admitted to their degree upon their character, without any such process being gone through. The examination in anatomy should be conducted in the dissecting-room; the examination in chemistry, in the laboratory; the examination in medicine and surgery, in the wards of a clinical hospital.”

It is, we think, to be regretted that Dr. Stokes has not dealt somewhat more practically with the question of education than he has done. Every one will, we are sure, readily agree with him, that it is very desirable that a degree in Arts should be required of all candidates for a licence to practise medicine. But then comes the question, Is it possible to make such a demand of all candidates, and at the same time to fully supply the country with medical men? Likewise, we should have liked to hear what Dr. Stokes would say on another point, and it is this: Do those medical men who obtain most esteem and reputation with the public, who are considered the most skilful, and are run after as the best curers of disease—do they gain their esteem and repute because they are men of high general attainments? or is it not rather because they are supposed to have some special knack or quality in treating diseases?

What do the public care about the general education of the doctor whom they employ? The public want a curer, or one who promises that he is a curer. They will run, not after highly educated practitioners of medicine, but rather after him who advertises himself to be a first-rate curer.

Let the most illiterate scamp of a doctor advertise his cures loudly enough, and he will beat out of the field the most learned and scientific men of the day. We would gladly have heard from Dr. Stokes how learning and science are to compete with the notorious success of ignorance and impudence. Our profession differs from other professions in one essential particular. In other professions, a man’s judges are his equals—his professional brethren. No man can successfully play the quack at the bar. He is there soon reduced to his level. But in the medical profession, a man’s judges are those who are utterly incapable of judging him fairly. And where does quackery of any kind reign more supremely than

amongst our judges—amongst the high and educated classes?

We have just touched on these points, because the difficulties here stated seem to us to require explanation from Dr. Stokes. In what way, we would ask—judging from what we now see going on around us in the actual world of practice—would a higher degree of primary (general) education raise our reputation as practitioners of medicine or surgery in the estimation of the public? In other words, if no degree in medicine were granted except to those who possessed a degree in Arts, would the public—the sick man—value our professional services more highly than he does at present? Does the possession of a degree in Arts in any way tend to secure a man's success as a practitioner?

THE BROADMOOR CRIMINAL LUNATIC ASYLUM.

THE following interesting notice of Broadmoor Lunatic Asylum is condensed from the *Times*.

The building at Broadmoor is the Government asylum, and is capable of holding all the lunatic murderers, men and women, of Great Britain. It is distant about two miles from the Wellington College Station of the South-Eastern Railway, and, surrounded by pine woods, commands a magnificent prospect. It is composed of a distinct block of buildings lofty and handsome. Every part of the buildings, and the slopes in front, are surrounded with high walls, for the place is not only an asylum, but a strong house of detention also. Beyond these walls, whether sane or insane, the murderers once committed to Broadmoor never pass in life or death. In all that relates to diet, lodging, and every other comfort, they are treated with almost an excess of care. They can see their friends, can write to whom they please, can take what exercise they like in the spacious airing grounds, can, in short, do anything but pass the boundaries which shut them in for ever from the world beyond. Within these they live and die, and within these are they buried in the little cemetery attached to the asylum.

Broadmoor now contains about 400 men and 50 or 60 women. Nearly all are homicides, the victims of their united crimes probably amount to nearly 1,000. Here one may occasionally see a female croquet party on the lawn, the players in which have been guilty in the aggregate of some 30 murders; or on the men's side, playing at bagatelle, a little group, with each of whose crimes all England at one time rung. The sitting, dining, and recreation rooms, are all on the ground floor, the dormitories and infirmaries being above. The low mental organisation which one always finds associated with crime in the common run of criminals, the small head, narrow and receding forehead, and restless furtive eyes, are at Broadmoor intensified, and in most cases accompanied with a weakly, undersized physical development. Small ill-formed heads, narrow stooping shoulders, weak limbs, and shuffling hesitating gait, are the rule among them.

In all the wards the same rule of early rising, at 6 o'clock in summer and 7 o'clock in winter, are observed. Their diet is nourishing and abundant. The men who smoke are, under the doctor's orders, allowed tobacco in moderation. They are encouraged to amuse themselves with reading and baga-

telle, and, in fact, everything is done to keep them quiet, which is about all that can be effected here. Anything like regular work as a labour is out of the question. All, it is true, would very gladly work; but only a very few can be trusted with such implements as spades, knives, scissors, or even needles and thread. In the quiet wards the patients have blunted knives and forks. In the "strong block" the food is cut up and the inmates have only a smooth horn knife and spoon. A few are trusted to work in the garden. There is a cobbler's shop, in which every one at work, save the superintendent, has killed one or more people. You can pass through a row of tailors, where the earnest-looking man in the midst, whose very spirit seems absorbed in the movement of his sewing machine, is among the worst, and, if mad crime is to be taken as a proof of danger, the most dangerous of all.

In the women's ward the same hours and rules are observed as in the men's, with only the difference which their additional fretfulness, vanity, and occasional acts of wanton, though not dangerous, mischief necessarily entails upon their management. The want of a refractory ward for the more violent of the women patients is sadly felt in this division, and the visitor's ear is often pained and startled by the prolonged hysterical outcries of those suffering under a sudden access of frenzy. Every possible care, however, is taken of them. Nearly all are quietly engaged in sewing or reading, while many, young and old, are walking rapidly to and fro in the airing ground beneath the window. It is very rarely that any of the women wish to be let out or make complaint of their detention. Their intellect seems to acquiesce at once, with a humble feebleness that is inexpressibly touching, in the necessity for their future restraint, and their mania seldom rises beyond little vagaries in the matter of dress or jealous anger among each other. It is easy to utilise their labour in the kitchens, laundry, and sewing-rooms, where, under the care of the wardresses, many of them work hard and well, while their weekly recreation, the singing class on Friday, is looked forward to with eagerness by almost all but those few whom no kindness can entirely conciliate to quietness with the others. The last comer in the women's block is one who murdered all her children in a fit of jealous vanity. The overweening airs of pride which this young woman still gives herself would be almost amusing in their exaggeration, if they were not also painful evidences of the hopelessness of her malady.

It is in the "strong block," however, where the most dangerous of all the male lunatics are confined. Here are confined the men whose murderous propensities and love of bloodshed seem almost inextinguishable. They are in the airing ground as we enter, a ground enclosed with tall, strong iron railings, within the area of which they are muttering and pacing to and fro, only a certain number within each sub-division of the yards, and with each gang sufficient warders to guide them, rule them, and, when their desperate fits of murderous insanity break out against each other, as they may do sometime, to overpower them when necessary.

With very rare exceptions, the minds of nearly all the men at least are bent on one object—how to get away. Whether through the interest of friends, by lamentably insane memorials to the Home Secretary, by fraud or violence, this is the one unchanging end which nearly all pursue. It is some comfort therefore to find that these incessant efforts are always unavailing. One would hear with less alarm that all the menagerie of Regent's Park was thrown open than that there was even the slightest chance of these men being again turned free to prey upon society.

Of the two, we honestly believe that the inmates of the menagerie would be less ruthless and less dangerous to human life than the liberated patients of Broadmoor. One thing the public may be pleased to learn, which is, that Victor Townley is not among the inmates of this great asylum. The intrigue which saved him from the gallows failed to secure him the easy life he might have passed here. The final examination which established his sanity, though too late to remit him to the hangman's hands, was early enough to consign him to penal servitude *for life*. In his case the work will be harder and the indefinite term of his dread sentence as inexorably carried out as it is among those mad criminals who are now and for ever enclosed within the walls of Broadmoor.

At another page will be found an account of important meetings held at Liverpool and Preston about the case of Pryce *v.* Bowen. These meetings, and the unanimous and determined position assumed by the influential bodies which attended them, will be of very great service to the profession in reference to the matter of medical evidence given in a court of law against a professional brother. In future the profession will show no mercy towards him who is guilty of thus indirectly bringing an innocent brother into a court of law, by lending his influence to the prosecution. As Mr. Steele well said at the Liverpool meeting, this is not a personal, but a general, question. Indeed, it must be confessed that Mr. Lund has done all he can to repair his false step. He has regretted that he ever touched the case, and has sent fifty guineas to the Bowen Fund, having received only fifteen guineas from the prosecutor. These meetings are the public professional declaration of a great principle. They are a warning to all those who may wrongfully offend in this wise in future. We may, on another occasion, say a few words touching the propriety of establishing a Defence Fund. We will now only remark, that the subject is one which requires serious consideration; and that strong arguments may be adduced to show that the maintenance of such a fund is neither advisable nor practicable. One only we may now adduce: viz., that the very existence of the fund will operate as an inducement for pettifogging attorneys to get up actions on speculation. The question, however, is one for discussion.

In a paper read before the Medical Society of London, on November 21st last, by Mr. H. Lee, the following interesting case is given, shewing the non-infecting quality of the milk as regards the syphilitic disease.

Agnes G., aged 21, married, was admitted into St. George's Hospital on the 5th of October, 1864. Had been married four years, had had two children, the youngest eight months old. Both these children were perfectly healthy, and she had always enjoyed good health herself. After her last confinement she took

another child to nurse; this child had the "thrush" and became covered with running sores. Its mother, an unmarried woman, was ill and had lost her hair and eyebrows. This child died three weeks before the patient's admission into the hospital. Shortly after taking this child to nurse she noticed a sore on the side of the right nipple, which became "eaten away," and "very hard all round." Six weeks before her admission into the hospital an eruption appeared over the body, and her throat became ulcerated. She had continued suckling her own child, which remained perfectly healthy up to this period. She had, however, always kept her own child to the left breast, and had always used the right breast, from which the ulcer had formed, to suckle the deceased child. On her admission to the hospital there was a sore on the right side of the right nipple with a hardened bare and glazed surface. The corresponding glands in the axilla were enlarged, and rolled readily under the finger; a copper-coloured eruption existed on the chest and arms; the throat was ulcerated on the right side, and the patient was suffering from pain in the head. The inguinal glands were unaffected. She was directed to discontinue suckling her own child. The secretion from the ulcer on the breast was carefully examined by the microscope, and found to contain no pus globules. The ulcer itself gradually healed up, having an indurated cicatrix. The glands in the axilla also remained specifically indurated. This patient's own child, although allowed to suckle for six weeks after the appearance of the eruption on the mother, remained quite unaffected, and continued perfectly well to the present time (Nov. 21st, 1864). This case thus appeared to show that the milk, if derived from an otherwise healthy breast in a syphilitic patient, has not the power of infecting a child, but supposing that some form of secondary disease had appeared on the mother's breast during the time of suckling, then the disease might readily have been communicated to the healthy child, exactly in the same way as the disease had been communicated from the diseased child to the patient.

At another page will be found an account of a suicide in which the jury determined that the unfortunate man was rendered insane by the perusal of "Dr. De Roos's" pamphlets.

M. VOISIN related an interesting fact to the Academy touching consanguineous marriages. In a little village near Croisic, in La Loire Inférieure, there has lived a population who from time immemorial have constantly intermarried. M. Voisin lately passed a month there, and counted that forty-seven marriages of consanguinity had produced one hundred and fifty healthy children, none of whom were albinos, scrofulous, rachitic, or deaf and dumb. He found the people healthy and robust, as it has been for two hundred years; and concludes that marriages of this kind have no injurious influence, when effected under the good conditions of healthy selection.

Two quacks, Morel and wife, have been condemned by the court at Niort in France, to a year's imprisonment and to pay a fine of 3460 *francs*, for the illegal exercise of medicine, and for practising magnetism, roguery, etc.

THE CASE OF PRYCE v. BOWEN.

MEETING OF THE MEDICAL PROFESSION
IN LIVERPOOL.

A NUMEROUS meeting of the members of the medical profession of Liverpool and the neighbourhood was held on Monday last, at the Medical Institution, with reference to the case of Dr. Bowen; Dr. Vose presided.

Dr. Vose said it was not long since the medical profession of Liverpool and the neighbourhood had held a meeting for the purpose of condemning the conduct of the witnesses for the plaintiff at a notorious trial in an adjacent city; and it was mortifying that they had so soon found it necessary to hold another to express their opinion upon a like subject. All probably had heard of the case of Pryce v. Bowen. The case belonged to a class which appeared to be rapidly establishing itself as one of the institutions of the country. Actions of this kind were set on foot by a certain description of the community, in concert with a certain description of attorneys; but they could never be brought at all, if there were not also a certain description of medical men ready, for a pecuniary consideration, to give evidence against their professional brethren, and thereby involve them in disaster and in loss. They all remembered the formidable expense entailed upon the defendant in the Chester case, although the verdict was triumphantly in his favour; and in the present case, although Mr. South of St. Thomas's Hospital, as well as other surgeons of eminence, together with the judge and the jury, concurred in the opinion that Dr. Bowen's professional skill had been unquestionable, they found that that gentleman had been mulcted in £200 costs to defend himself, to say nothing of the annoyance, waste of time, and the suspense, in which he had been involved. It was to be hoped that the machinery of the British Medical Association would, without delay, be brought to bear upon this and similar transactions, and that its opinion would be expressed unflinchingly on the conduct of its members when they came forward to give evidence against professional men in cases like Pryce v. Bowen. [*Hear, hear, and cheers.*] So strongly had his (the chairman's) colleagues of the Royal Infirmary felt on this matter, that they lost no time, after the trial, in addressing the physicians and surgeons of the Manchester Royal Infirmary with reference to it. In rather less than a fortnight afterwards, they had the honour to receive an answer to their remonstrance; but only from a functionary of the hospital, who subscribed himself its "resident medical officer."

Mr. ELLIS JONES, who moved the first resolution, said that no doubt many members of the profession had been extremely annoyed at the imaginary opinions formed by patients of the mal-treatment of their cases. Both he and his colleagues had suffered in some degree in this way; and he mentioned a case at the Northern Hospital (with which Mr. Hakes had been more particularly concerned) where the patient expressed himself perfectly satisfied with the treatment he had received, and thanked Mr. Hakes and others for their attention to his case. But when he had left the hospital, he got hold of a medical man or two in the town, who told him that the treatment was not correct; that Mr. Hakes and the other medical men had no right to interfere with his limb; and even went so far as to say that no dislocation had taken place. The president had told

them that actions like these were frequently brought in consequence of the assertions of persons who knew nothing of the treatment adopted, and who sought only to injure the fair fame of honourable men. [*Hear, hear, and applause.*] Mr. Jones mentioned another case in point within his own experience in Liverpool, where, though no action was actually taken, a medical man had been served with a writ, and sustained great anxiety and annoyance. With regard to Dr. Bowen's case, he (Mr. Jones) had been requested by the attorney for the prosecution to appear against Dr. Bowen; but he declared that he would rather sacrifice his property, and even his life, than do so, and he recommended the attorney to give up the case. [*Cheers.*] What, then, was his surprise to see a man, whom he had thought highly respectable, come forward from Manchester and give evidence for the prosecution. Mr. Jones then criticised the evidence adduced by Mr. Lund; and ridiculed the statement of Mr. Evan Thomas, jun., as to his having seen "thousands" of cases of arm dislocation. In conclusion, he warmly vindicated the talents and standing of Dr. Bowen; and pointed out how immense and unknown an injury might be done to a medical man by such unjustifiable attacks. He moved—"That this meeting desires to express their deep sympathy with Dr. Bowen for the annoyance to which he has been subjected in the trial of Pryce v. Bowen; and to congratulate him on the very satisfactory manner in which he has vindicated his professional reputation."

Dr. A. T. H. WATERS seconded the resolution. Painful as it was, he said, it was their duty on an occasion like this to come forward and express their sympathy and congratulations, and also, in firm and unmistakeable language, to declare their opinion of those who unjustly and unfairly gave evidence against their professional brethren. Meetings like the present would ultimately tend to put a stop to these most unjustifiable prosecutions; they had an important influence both on the profession and on the public, tending to show, in both cases, that a man who acted honourably and conscientiously and to the best of his ability, when unjustly accused, would have the support of his profession. [*Applause.*] If they respected and appreciated their own profession, so would the public respect and appreciate them. [*Hear, hear.*] With regard to Mr. Lund, he (Dr. Waters) could not help remarking that had Mr. Lund acted upon the golden rule, not to give an opinion upon the case before he had consulted with his professional brother, he would never have placed himself in the painful position which he now occupied, and the case of Pryce v. Bowen would never have been tried. [*Hear, hear.*] No honourable member of the profession would hesitate to give evidence against a professional brother who had been guilty of culpable negligence; but, in this case, everything had been done which skill could dictate; and it was inexcusable for a member of their profession to give evidence such as that which had been adduced. Dr. Waters hoped that meetings of this description would tend rather to diminish trials of the kind under review, and he believed this had actually been the result, as was shewn by the difficulty of procuring medical witnesses in the case which had been alluded to by Mr. Ellis Jones, in which both Liverpool and London were canvassed in vain. In conclusion, Dr. Waters warmly echoed the congratulatory terms of the resolution, which was then put and carried unanimously.

Mr. BICKERSTETH moved: "That this meeting feels bound to record their strong disapprobation of the course pursued by Mr. Lund in the matter of Pryce v. Bowen." It was extremely painful to pass a vote of censure upon any man, and nothing but a

stern sense of duty would have impelled him (Mr. Bickersteth) to move the resolution. Had it not been for the conduct of Mr. Lund, he believed the trial would never have taken place. He had it on the authority of the solicitors for the plaintiff, that they had canvassed Liverpool, and had found no one who would support the evidence. [*Hear, hear.*] By Mr. Lund's own acknowledgment, he had been called upon by the solicitors for the plaintiff with the object of involving a professional brother in disgrace, and he did not hesitate to give his services. Mr. Bickersteth alluded to the misstatement as to Mr. Lund's connexion with the Royal Infirmary of Manchester. He (Mr. Bickersteth) had read Mr. Lund's defence or explanation; but explanation it was not. Mr. Lund "regretted that he had ever appeared in the case;" and no doubt he would regret it as long as he lived, for they were a strong professional body; they had expressed their opinion of Mr. Lund, and Mr. Lund and Evan Thomas would for the future be connected in the minds of the profession with this case. In conclusion, Mr. Bickersteth pointed to the fact that in Mr. Lund's statement a simple regret was expressed that he had erred from a want of judgment—no regret that he had injured a member of his own profession and a brother practitioner. [*Hear, hear.*]

Mr. STEELE wished to place the nature of the meeting in its true light. It must be clearly understood that they had not met for the purpose of attacking any individual: it was not an aggressive, but a defensive movement, on the part of the medical profession. [*Applause.*] All present would acknowledge that, as public servants, they were responsible to the public for the efficient discharge of their duties; and any physician or surgeon who undertook the care of a case of disease or injury was bound to bring to its treatment a reasonable amount of skill, judgment, and attention. If a person suffered damage in life or limb through the gross negligence or ignorance of his medical or surgical attendant, he was undoubtedly entitled to compensation at the hands of that attendant; and, if such a case as this were brought before a legal tribunal, any member of the profession summoned to give evidence was not only justified but bound to obey that summons, and to give his honest opinion upon the case. Mr. Steele further argued, that the case of Dr. Bowen was not at all an analogous case to this, inasmuch as all necessary skill had been shown; and that the gravamen of the offence against professional propriety—the injury which Mr. Lund had done to himself, and the scandal that he had brought upon his profession—did not consist so much in what he said and did at the trial as before the trial. [*Hear, hear.*] Mr. Steele then quoted from the BRITISH MEDICAL JOURNAL of the 14th of January, which contained a letter from Mr. Lund to the editor. It was clear, he said, that the prosecution in Pryce v. Bowen had submitted a case to Mr. Lund, with the view of getting his opinion as to how far an action would lie, and what chance they had of getting a verdict. In this case, Mr. Lund had placed himself in the position of a grand jury, with the very important distinction, that grand juries never ventured to cut or to find a bill without hearing the evidence on both sides. [*Hear, hear.*] Mr. Lund said, in his letter: "It has been asked, how is it that I did not apply to Dr. Bowen, and hear his version of the case before the trial? My answer is, that it did not occur to me to do so; and, had I thought of it, I should have considered it highly improper, after giving an opinion on the merits of the case to the solicitor for the plaintiff, to have communicated with the defendant." Thus he admitted giving his opinion on the merits of the case—an opinion which must have been founded upon an extremely ambiguous

statement of an uneducated woman as to whether the arm was in a prone, semiprone, or supine position, during a certain period of the treatment. But that was not all. Mr. Lund actually went further, and anticipated the defence Dr. Bowen was likely to set up, and suggested to the prosecution how they should be prepared to meet that defence. Mr. Steele gave quotations from the letter to support his argument, and then went on to say that the whole letter went to show Mr. Lund seemed at times to be desirous of conveying the impression that he was not prejudiced against Dr. Bowen, while at the same time he afforded all the materials requisite for an attorney to go on with an action. [*Hear, hear, and laughter.*] Dr. Waters had alluded to this matter; and, at the last meeting held in that room, this very point was brought forward by a speaker in reference to Drs. Ramsbotham and Lee, that a great portion of the offence that they committed consisted in the fact of venturing to give an opinion upon the treatment of a case without consulting the professional man who had the case in the first instance. Mr. Lund could hardly be ignorant of that case; and he (Mr. Steele) could really not understand how he could have forgotten to communicate with Dr. Bowen. [*Hear, hear, and cheers.*]

The resolution was then put, and carried unanimously.

Dr. STOOKES moved: "That a subscription be opened to assist Dr. Bowen in defraying the needful expenses incurred for his defence." Dr. Stookes remarked that there could be little doubt that, in addition to the annoyance and harass which he had experienced, Dr. Bowen had been put to very large expense in the case; and it was most desirable that his professional brethren should assist in defraying this expense.

Mr. HAKES had much pleasure in seconding the resolution, having had the misfortune himself to have been harassed in the same way as Dr. Bowen. In referring more particularly to his own case, Mr. Hakes said that, in order to procure witnesses against him, not only Liverpool, but London and other parts of England, were canvassed for the purpose; and he mentioned the fact that Mr. Erichsen of London, who had given an opinion on the case which precisely accorded with the treatment which he (Mr. Hakes) had adopted, after doing so, declined to have anything more to do with the case until he had communicated with the defendant. Mr. Erichsen wrote him (Mr. Hakes) a letter, telling him all he had discovered, and which made it easy for him to ask Mr. Erichsen to offer his services. Fortunately, he was not required; for the case broke down, the plaintiff being non-suited. But this conduct of Mr. Erichsen formed so marked a contrast to that which had occurred in connexion with Dr. Bowen's case, that he (Mr. Hakes) felt bound thus publicly to call attention to it. [*Applause.*]

At this point of the proceedings, Mr. Ellis Jones read a letter from Dr. Bowen, stating that the expenses of the case would be under £175. The resolution was then put, and carried unanimously.

Dr. SCHOLFIELD (Birkenhead) said he had received a letter from Mr. Hammond of Preston, stating that a meeting had been held in that town in reference to Dr. Bowen's case, and that upwards of £17 had been subscribed.

In reply to Mr. ELLIS JONES, Dr. Scholfield stated that Dr. Dobie and Mr. Harrison of Chester had each contributed to the fund; Mr. Harrison having also engaged to canvass the profession in Chester.

Dr. DESMOND moved, and Dr. FENTON seconded: "That Dr. Stookes be requested to act as Treasurer to the fund." This was adopted unanimously.

Mr. MANIFOLD proposed, and Mr. PARKER (Kirkdale) seconded, a resolution that the proceedings of the meeting be forwarded to the medical journals. This was adopted. Mr. Parker remarked, that accusations of this kind were now so frequent, that it would really in a short time be a question with many, how far they would be justified in the treatment of cases which were likely to end in a manner not quite so satisfactory as they could wish. He suggested that a committee should be appointed from the present meeting, to take into consideration some further means of preventing similar proceedings in future. The resolution was then adopted.

Mr. LOWNDES remarked that, as Mr. Martin's name had been brought in question in connexion with the case, and as Mr. Martin was present, it was desirable to hear any explanation he might wish to make.

Mr. MARTIN said that when he saw the case, they asked him what he should propose. He said he would not do anything without meeting Dr. Bowen in consultation, and that he should like to meet him. [*Hear, hear.*] He (Mr. Martin), in consequence of this application to him, and hearing that the case was going to trial, thought it his duty to go over to Oxtou, and he had two interviews with Dr. Bowen. [*Hear, hear, and cheers.*]

Thanks to the Chairman were then moved by Mr. STUBBS, seconded by Dr. IMLACH, and carried unanimously. After which, subscriptions were received, Mr. McCheane and Mr. Harrison acting as secretaries to the fund.

MEETING OF THE MEDICAL PROFESSION IN PRESTON.

A MEETING of the medical profession of Preston was held at the Literary and Philosophical Institution, on Wednesday week, for the purpose of expressing sympathy with Dr. Essex Bowen, of Birkenhead, on the occasion of the unjust prosecution to which he has recently been subjected. At the meeting there were present Drs. Altham, Broughton, Brown, Gilbertson, Hammond, Heslop, Moore, Ridley, Smith, Stavert, and Walling, and Messrs. Pilkington and Richardson. Dr. STAVERT occupied the chair. Letters, approving of the object of the meeting and expressing strong sympathy with Dr. Bowen, were read from several gentlemen.

The first resolution was proposed by Dr. BROUGHTON, seconded by Dr. HAMMOND, and carried unanimously, viz.:—"That this meeting sympathises most deeply with Dr. Bowen on the annoying and vexatious trial to which he has recently been subjected, and begs most cordially to congratulate him on its satisfactory termination."

The second resolution, which was proposed by Dr. GILBERTSON, seconded by Mr. PILKINGTON, and carried unanimously, was as follows:—"That this meeting most strongly condemns the practice of medical men giving evidence against their professional brethren without first communicating with them."

The third resolution was proposed by Dr. SMITH, seconded by Dr. ALTHAM, and carried unanimously:—"That a subscription be commenced to assist in defraying Dr. Bowen's legal expenses, and that Dr. Hammond be appointed treasurer, and Dr. Moore honorary secretary."

It was next moved by Dr. ALTHAM, seconded by Dr. RIDLEY, and carried unanimously:—"That this meeting is of opinion that it is desirable to establish a General Medical Defence Fund for the protection of the profession, and suggests that any funds left after defraying the costs of Dr. Bowen's suit should be devoted to that object."

The last resolution was proposed by Dr. WALLING, seconded by Mr. RICHARDSON, and carried unanimously:—"That copies of the foregoing resolutions be forwarded to the different medical journals, and to Dr. Scholfield, the chairman of the Birkenhead meeting."

A vote of thanks to the chairman terminated the proceedings.

Special Correspondence.

MANCHESTER.

[FROM OUR OWN CORRESPONDENT.]

THE case of Pryce v. Bowen has created a good deal of discussion among us. This has been due both to the intrinsic interest of the case; to the spirited manner in which it has been taken up by yourself; to the personal character and position of Mr. Lund; and perhaps, slightly, to a feeling of mild rivalry which exists between Manchester and Liverpool. On the merits of the case there is, of course, but one opinion. Mr. Lund has committed a decided error; one that might have had most serious effect on Mr. Bowen, and one which the profession and its organs could not, if true to themselves, afford to overlook. The principle must henceforth be considered more firmly established than ever, that no medical man is justified in giving an opinion on the treatment of a fellow practitioner till he has heard his own statement of the case; and then only when there is clear and distinct evidence of culpable negligence. The profession is a gainer by the trial in that our professional ethics have been so forcibly maintained. Such being the case, may it not be allowable to temper justice with mercy? I speak with certainty when I say that he is one of the very last men in Manchester whom, from his previous professional character, one would have expected thus to err. Anxious, and I believe successfully anxious, to stand well with all his brethren, I am sure that nothing but an unaccountable error or haste of judgment could have led him into the matter. Anything like personal *animus* has not even been hinted at. His position as a former president of the Medical Society, and as one of our own Council, speak to his general estimation. I cannot but think that an otherwise unblemished professional character must lead us, after condemning and deprecating to the utmost the false step, to deal not too harshly with him, when he comes forward in a straightforward manner, admits to the full his error, and endeavours to atone as far as an honest man can. I believe he has already sent £50 to Mr. Bowen's fund; and I have seen no one who doubts that, as far as an honest admission of error can go, he has done all that lies in his power. Taking for granted the plaintiff's statements, which, of course, was the grand mistake, I do not see that his opinion as a surgeon is compromised. I believe Mr. Lund himself has said, that the acquittal was mainly due to the straightforward, manly way in which Mr. Bowen himself gave his evidence as to facts.

The attempt to fasten something like voluntary

perjury on Mr. Lund, with regard to his calling himself an infirmity surgeon, is simply hitting a man when he is down. It arose from the anomalous position of the surgeons to the dispensary department—a position which has already been abolished for all future members. There would have been nothing said on that point, had he been on the right side. To conclude, the case has done us all good here. The right has been fully vindicated, and a rod held in pickle for men of less character than Mr. Lund. He himself has suffered mentally and otherwise more than most are aware of; and I think I speak the opinion of all here when I say that his suffering has been held to atone for his error, and that there is no doubt of his being reinstated in our esteem as one who has admitted to the full his error, and who, if a sadder, yet as a wiser man, has still to look forward to a career of honour and respect.

I have left myself no room for other matter. A fatal case of chloroform, due mainly to syncope, rather than asphyxia; a case of explosion in making oxygen gas, which might show the public one of the numerous penalties they pay for free trade in physis, —have been reported in your columns. So I draw this to a close, hoping that I may not soon have a similar case to remark on.

EDINBURGH.

[FROM OUR OWN CORRESPONDENT.]

AMONGST the topics of Edinburgh conversation of special interest to your professional readers is the *fama* that our distinguished professor of clinical surgery has, during the last few weeks, successfully performed extirpation of the whole of the tongue. As the case occurred in Mr. Syme's private practice, I am unable to supply any details in connection with it; the bare fact that the operation was performed, and successfully too, having reached me.

In a former communication, I referred to the remarkable success which Dr. Thomas Keith had achieved as an ovariologist—a success which has placed the operation on a sure and firm footing in Edinburgh. Since my last communication, Dr. Keith has performed many operations, and his success has been very great. He has had eight successful operations in succession; and it is to the eighth of them that I wish to call attention, as it was performed under circumstances which might well be considered desperate, and as it is altogether, I believe, without precedent. Dr. Keith was consulted, a few weeks since, by a patient suffering from ovarian dropsy. The symptoms were urgent, and the tumour much distended, and as a palliative Dr. Keith determined to have recourse to tapping the cyst, fully intending to extirpate it on a subsequent occasion. After the tapping, however, symptoms of inflammatory action came on; the patient became very ill; and five days after she was evidently fast sinking. As a last expedient, Dr. Keith determined to proceed at once with the operation; and he accordingly removed a cyst weighing fifty-seven pounds and a half. When

opened, this cyst exhaled the most horribly offensive odour, and it was found to be gangrenous. Immediately after the operation, the woman rallied; everything progressed satisfactorily, and she made a perfect recovery. The age of the patient was 51; and, as explaining to a certain extent her extraordinary recovery, I may say that she came from the country, and appeared to be a woman of vigorous constitution. This patient was the twenty-fourth on whom Dr. Keith had operated; of the twenty-four patients, eighteen have recovered; the last eight cases operated upon having all been successful.

On Monday evening last, Sir David Brewster read a short memoir before the Royal Society of Edinburgh, On the Causes and Cure of Cataract. The interest which any paper by so distinguished a man must necessarily elicit, was heightened on this occasion by the fact of one so altogether unconnected with medicine having chosen for investigation so professional a subject. Sir David Brewster had his attention directed to this subject about thirty years since, when he became affected with incipient cataract. His attention was first directed to the morbid alteration, by noticing that when he looked at a luminous object it appeared surrounded by coloured fringes; and he was led to investigate the optical conditions necessary for the production of this phenomenon. He arrived at the conclusion that it was due to a separation of the constituent toothed fibres of the crystalline lens, and that the proximate cause was an alteration in the quantity and quality of the fluid of the lens. To this opinion he was led by his own experience, and by the observations which he had made on the changes which the crystalline lens undergoes when immersed in water for various lengths of time. The quality and quantity of this fluid, he supposes, is influenced almost entirely by the quality of the aqueous humour; and it is to inducing alterations in this fluid that the efforts of the surgeon should be directed. When the aqueous humour is too watery, the quantity of the fluid in the capsule of the lens is increased, and a soft cataract is produced; whereas, when the opposite condition exists, the fluid enclosed in the capsule of the lens will be insufficient to establish optical continuity between the fibres of the lens, and a hard cataract will result.

The efforts of the surgeon should be directed, according to Sir David Brewster: 1, to bring about a change in the general health of the patient, for sometimes, as in his own case, such general treatment may suffice to re-establish the proper balance between the fluids and solids of the eye; and 2, to change, by local means, the quality of the aqueous humour. He suggested that the anterior chamber should be repeatedly tapped, and that in those cases where the aqueous humour has too high a density, it should be replaced by water. Instead of having recourse to the latter expedient, the surgeon might trust to the fluid secreted after the operation being altered in quality.

At the termination of Sir David Brewster's com-

munication, Dr. Simpson drew attention to the fact that Sperino of Turin had lately published a monograph, in which he had stated that, by means of repeatedappings of the anterior chamber, he had succeeded in curing cases of cataract.

As confirming the value of Sir D. Browster's suggestions, I may say that, on visiting Utrecht two years ago, I happened to meet Dr. Raymond, Professor Sperino's assistant, himself a very able young surgeon, who informed me that he had tapped the anterior chamber in a very large number of cases of glaucoma and cataract; that the operation could be repeated daily with perfect impunity for an almost indefinite period; and that the results, in cases of incipient cataract, were remarkably satisfactory.

On Thursday last, the President and Fellows of the Royal College of Surgeons of Edinburgh held a *conversazione* in the hall of the College, when Dr. Rutherford Haldane delivered a most interesting lecture, on the Modern Practice of Medicine. Dr. Haldane considered in succession the advances which pathology, diagnosis, and therapeutics, have made during the last few years, directing attention to the most remarkable discoveries in each of these departments. In his review of the progress of therapeutics, Dr. Haldane strongly opposed the view of a change of type in disease, arguing that a change of the opinions of physicians had, instead, led to a change in their mode of treating disease; a view which was also warmly espoused by Mr. Syme in some remarks made at the close of Dr. Haldane's lecture.

Reports of Societies.

LIVERPOOL MEDICAL INSTITUTION.

DECEMBER 15TH, 1864.

JOHN CAMERON, M.D., Vice-President, in the Chair.

Medullary Cancer. Mr. LOWNDES exhibited a specimen of medullary cancer of the tibia, removed by him from a female patient in the Northern Hospital.

Alopecia. Dr. BALMAN recorded cases of alopecia areata. [An abstract will shortly appear.]

A Sketch of the Epidemic Fever now Existing, with Special Reference to its Origin and Mode of Extension. By A. B. STEELE, Esq. Although Liverpool was never entirely free from typhus, nor perhaps from most other zymotic diseases, yet, since the great epidemic of 1847, this disease has very much decreased, until about three years ago, when it began to increase gradually, and might be said to have become epidemic in the autumn of 1862. From September 1862 to 1864, the number of typhus patients in the Liverpool Fever Hospital ranged from 60 as a minimum to 200 as a maximum. From that period, the following table indicates its progress.

Number of Typhus Cases in the Hospital.	
During the 39th week of 1864	207
" 40th " " "	262
" 41st " " "	288
" 42nd " " "	316
" 43rd " " "	345
" 44th " " "	371
" 45th " " "	346
" 46th " " "	336
" 47th " " "	321
" 48th " " "	376

The following figures show the death-rate during the same period.

Weekly Average of Typhus Deaths in Liverpool.

First quarter of 1864.....	23
Second quarter of 1864.....	26
Third quarter of 1864	30

Weekly Average since.

40th week.....	47	45th week	55
41st week	48	46th week	54
42nd week	44	47th week	54
43rd week.....	59	48th week	53
44th week.....	53		

The course of the disease, as indicated by those tables, and as observed by the author in tracing its progress in the town, appeared to favour the view that, as would be shown hereafter, the mode of its extension was by contagion alone. Striking illustrations of this were adduced. Certain streets and courts, where overcrowding, bad ventilation, and all the other alleged causes of fever, existed in full force, remained entirely free from epidemic typhus for at least two years after it had become epidemic and was extensively prevailing in other parts of the town; in these very streets, in the early part of the epidemic, a few imported cases of typhus had been observed, but they gave rise to no extension at that time. These localities had been in the same sanitary condition for the last fourteen years, and yet typhus was not epidemic there until a few months ago.

The type of the epidemic was true typhus, all the cases presenting the characteristic eruption, except in children. The prominent symptoms in the generality of cases were those referable to lesion of the function of circulation, indicated by prostration, frequent, weak pulse, dependent upon disturbance of the action of heart and large vessels; and by maculæ and petechiæ, resulting from lesion of the circulation of the capillary system. The disturbance of the cerebro-spinal system or the lesion of innervation, indicated by loss of rest, delirium, coma, and subsultus, was less frequent and less prominent than usual, especially amongst the pauper class.

There has also been but little tendency to complication or local lesion; so that although, as before noticed, the function of circulation has been most engaged in the disease, yet the very complication most likely to ensue—namely, that of the respiratory system—has not followed—at least, to any extent. In many cases, there was short, dry, irritable cough, scarcely ever proving serious or troublesome; and hitherto the author had met with nothing approaching the amount of hypostatic pneumonia which so frequently complicates typhus, which he learned was at the present time frequent in the wards of the London Fever Hospital, and which he remembered as a prominent feature in the cases in the Liverpool Hospital towards the close of the epidemic of 1847.

He referred the comparatively small extent to which the disturbance of the cerebro-spinal system existed in the poor to the fact that they have less thought and anxiety and are more enduring than those in a higher social scale, where the brain was more active in health, and the nervous system generally more susceptible. The freedom from thoracic complication, he attributed to the mildness of the season, and anticipated its increase as the weather became more severe.

A few cases of typhoid were met with; but these did not seem to have any connection with the present epidemic; out of about two hundred cases of fever during the last four months, the author had only seen about eight or ten of typhoid.

As might have been anticipated from the type of this epidemic, the mortality has not been high.

Compared with the average death-rate as computed by Dr. Murchison at 19 per cent. for England and Scotland, the present epidemic contrasts most favourably. In connection with this part of the subject, the author directed attention to the apparent low rate of mortality amongst typhus patients treated at their own homes as compared with those treated in hospital. He said apparent advisedly, because the results obtained from a careful and rigid inquiry were so opposed to preconceived notions, and constituted a problem upon the solution of which might depend momentous issues affecting the whole question of typhus, both in a sanitary and a therapeutic point of view, that he was disposed to accept them with the mental reservation that more extended inquiry might change the aspect of the case.

The following figures at once show the state of the case.

Typhus Mortality—Death-rate per cent. of Attacks.

	Under 20 years.	20 to 40.	40 to 60.	60 and upwards.
In 153 cases treated at home. District No. xi.	2.3	6.25	15.4	?
Liverpool Fever Hospital. (1864.) 1249 cases.	4.3	16.7	36.1	50.0
London Fever Hospital. (Ten years) 3506 cases.	5.5	16.9	39.6	62.3

The average mortality at all ages in the Liverpool Fever Hospital was about 15.5 per cent. The author had ascertained as accurately as possible the death-rate of home-patients throughout all the parochial districts, twelve in number. The result gave about 6 per cent.; but he could not rely so thoroughly upon the accuracy of those returns, as upon the figures given above.

He was not at present prepared to give a satisfactory explanation of this marked difference in the death-rates, in and out of hospital. The subject merited, and would no doubt receive, further investigation. He pointed out that any unfavourable comparison which might be made applied to fever hospitals in general, and not to the Liverpool Hospital in particular, as the death-rate in that institution is below the general average.

The author alluded to the present prevalence of other zymotic diseases—small-pox, scarlatina, and erysipelas of a low type—indicating, he thought, some peculiar condition of depressed vitality or other constitutional peculiarity favouring the spread of zymotic disease.

He then proceeded to show that the only exciting cause of typhus was contagion. All other agencies to which its generation has been attributed, he considered to be predisposing causes only. He illustrated this view—first, by analogical reasoning; and, secondly, by actual observation. He based his argument upon the zymotic theory of Liebig, endorsed by Simon and Paget, of which he gave a summary as given in the last edition of Dr. Watson's lectures. He thought that as malarious diseases, such as ague and yellow fever, are not contagious, there was *a priori* ground for the converse—namely, that contagious disease, such as small-pox and typhus, were not malarious—that is to say, they could only be produced by the introduction into the system of their own specific virus, and not by exhalations of any other kind.

With reference to destitution, which had been prominently mentioned as a cause of the epidemic, he pointed out that there was no proof whatever that greater destitution than usual now existed in Liverpool; but, on the contrary, the poor were suffering

under far less pressure than at other periods when there was but little fever amongst them. Of all the Lancashire towns, Liverpool had suffered least from the depressing effects of the cotton famine, but most from typhus. In Blackburn, where there was much more poverty and distress, there was no typhus. And as to the Lancashire "midden" being a cause of fever, the question was easily disposed of; in London, there are no middens, but plenty of typhus; in Manchester, there are more middens than in Liverpool, but typhus had been absent from Manchester for many years until quite recently, and now existed only to a limited extent. All Lancashire towns have middens, but only one or two have typhus; none, in fact, to a serious extent, except Liverpool.

He fully admitted that destitution and its concomitants, especially over-crowding and bad ventilation, as predisposing causes, tended greatly to foster and promote the extension of the disease; but denied that fever was ever generated *de novo* by such conditions.

He adduced numerous striking facts, from authentic records of various authors, and from his own observation during nearly twenty years' experience as a public medical officer in Liverpool, showing that, on the one hand, all the alleged causes of typhus might exist either separately or in combination, and exist permanently, and yet no typhus would be produced; and, on the other, that typhus might and often did exist where none of these causes were present. He quoted, amongst other records, from the last report of the medical officer of the Privy Council, narratives of epidemics at Whitehaven by Dr. Bristowe, and at Festiniog by Dr. Buchanan. The latter was a most marked example of over-crowding, and yet not a single case of typhus occurred; and although typhoid fever which constituted the epidemic was evidently connected with the over-crowding and owed its extension to that cause, there was no conclusive evidence that the disease was generated *de novo* on the spot, or that it might not have owed its origin to contagion from without. The Whitehaven epidemic, he considered to illustrate a possible source of fallacy in tracing the cause of epidemics which appeared to have escaped notice. The report of Dr. Bristowe is summed up thus: "It is difficult to suggest any measures for producing typhoid fever so likely to be efficient as those which have allowed Whitehaven to be degraded into its present filthy state." His account of the epidemic there states that "fever was very common in Whitehaven until about fourteen years ago; but from that time until the commencement of 1862, it had practically disappeared." He does not, however, show that the supposed causes of the fever are of recent origin; and from our knowledge of that town, it is probable no great change has occurred for some years. Could it be supposed that, fourteen years ago, some sudden sanitary impulse removed all the then existing causes of fever and kept them in abeyance until 1862, when the town again abruptly deviated from the sanitary standard and was again visited by fever? Was it not more in accordance with common sense to suppose that Whitehaven has been for many years a filthy, over-crowded, ill-regulated town, and that the absence of fever for a long period, and its recent prevalence, is referable to some additional cause—viz., to the introduction of the disease by contagion? The author wished to be distinctly understood as fully appreciating the value of sanitary measures; but thought the views he had enunciated assisted us in directing those measures in their most efficient course, and enabled us to take a calm and rational view of the benefits that might be expected from them.

Mr. HAKES hoped Mr. Steele would explain the great difference that existed in the mortality between patients treated in hospitals and in their own homes.

Dr. SHEARER agreed with Mr. Steele in regarding the rapid spread of fever as an indication of an altered constitutional condition rendering the body more susceptible to the attacks of the disease. Dr. Shearer, alluding to destitution as a predisposing cause, drew attention to the fact, that in 1860 and 1861 there was not much fever; but in 1862 it prevailed, and this was the time when there was a large amount of destitution, owing, in a great measure, to commercial difficulties; and he considered that the ravages of fever might have been materially lessened if the distress had been more bountifully relieved. The hospital mortality was doubtless great; and, he thought, owing very materially to the following causes. 1. The worst cases were sent to the hospital; 2. Depression of spirits consequent on leaving home; 3. That home-nursing, even amongst the poorest class, was better suited to their requirements than that met with in hospitals.

Mr. BAILEY, Mr. GARTHSIDE, Dr. PRYTHORCH, and Dr. VASE, took part in the discussion.

Owing to other business, and the length of the paper, time would not allow of further discussion, and it was, therefore, resolved that the subject should be re-opened by Dr. Gee at the next meeting of the Society.

Mr. STEELE, in reply, alluded to the great importance of removing patients into hospital in as early a stage of the disease as possible; for when it was delayed, the chances of the patient's recovery were greatly diminished; and this delay that so often occurred doubtless tended materially to increase hospital mortality. He did not agree with Dr. Shearer with reference to nursing; and did not consider that destitution had much to do with the present outbreak of the disease. We have had far greater commercial panics, and no outbreaks of fever.

Correspondence.

MEDICAL ERRORS.

LETTER FROM GEORGE JOHNSON, M.D.

SIR,—The passage in Dr. Barclay's book which most provoked me by what I considered its bold inaccuracy is the following.

"One or two remarkable recoveries took place after the administration of castor-oil; and it was consequently assumed that the action of the oil was strictly curative by aiding in the elimination of the poison."

We have now Dr. Barclay's apology for this passage.

"He [Dr. Johnson] objects to the phrase 'one or two remarkable recoveries,' because there were twelve recoveries in all. Were they all remarkable? I think not. My own experience of cholera would have led me to expect several of the cases detailed to recover without any treatment at all."

True. And I must confess that, until I read Dr. Barclay's letter in the last number of our JOURNAL, I had not discovered the convenient loophole which he had here provided for himself in the use of the word "remarkable".

Again, Dr. Barclay says: "I do not think I have ever by implication asserted that the assumption was based on the fifteen cases." To which I reply: No, not on the fifteen cases, but, as plainly as language can declare it, on the "one or two remarkable recoveries" referred to in the above quotation, which I have given in italics.

In short, Dr. Barclay, in his capacity of Lumleian lecturer, with the College of Physicians as his audience, and *Medical Errors* for his subject—bound, therefore, as he was, to be more than ordinarily precise and accurate both in his facts and his logic—asserts that I, having witnessed "one or two remarkable recoveries" from cholera after the administration of castor-oil, at once jumped to the conclusion that castor-oil is the cure for that terrible disease. It is true, that he elsewhere states that the assumption in question was based on what he is pleased to call "a false analogy with mineral and vegetable poisons"; but this only shows that, with curious inconsistency, a great logician and a teacher of correct reasoning may give two different explanations of the same phenomenon: it does not render the statement which I have above emphasised in any degree less offensive or less inaccurate.

When, within a few days after Dr. Barclay's lectures were delivered, I occupied the position of lecturer in the same room, and with the same audience, I was, happily for myself and my own mental composure, quite unconscious that I had so recently been exhibited there as a dreadful example of illogical and inconclusive reasoning.

Now, was it too much to expect that Dr. Barclay, before criticising my theories and my practice, should have taken the trouble to read what I have actually written on the subject under discussion? If he had done so, he would have known that I have nowhere said that castor-oil is a cure for cholera. He would have seen that my method of reasoning on this subject is not so illogical as he has represented, and as he doubtless believed it to be. He would have found that I have indulged in no extravagant expressions as to the success of my treatment; and he must, I think, in justice have admitted that, even if I have done nothing more in this matter, I have shown the fallacy of many of the conclusions which have been formed as to the effect of various modes of treating cholera; and that I have prepared the way for a better understanding of both the pathology and the treatment of that disease.

I am perfectly well aware that the fifty-four cases which I have published are insufficient to establish the utility of my mode of treatment. I am glad to have Dr. Barclay's acknowledgment that the hundred and fifty cases collected by the Board of Health are "just as insufficient to prove that it is valueless". I am persuaded that the mortality from cholera, under any plan of treatment, will always be great. I am convinced that, in a considerable proportion of cases, recovery will take place by the unaided powers of nature. I am also convinced that, while on the one hand the mortality may be much increased by mistaken modes of treatment, whose tendency is to oppose the curative efforts of nature, it may, on the other hand, be materially lessened by means which are calculated to aid those efforts. I am sure, too, that it will always be difficult to estimate truly the influence of any plan of treatment in this disease. All this I have endeavoured to set forth in my book on cholera; and, if I may be allowed to quote my own preface, "while I neither expect nor wish to escape criticism, I desire that the criticism which I receive may be impartial and honest—such, in short, as truth and the interests of humanity alike demand."

There are several statements in Dr. Barclay's letter to which I could easily reply; but I have no desire to prolong this discussion. I cannot, however, refrain from alluding to the startling novelty of the assertion that, without previous absorption, neither calomel nor castor-oil can act as a purgative.

I trust that I have not, either in this or in my pre-

vious communication, transgressed the bounds of legitimate self-defence; and I feel sure that Dr. Barclay, in the second edition of his interesting book, which without doubt will soon be called for, will so modify his criticism of me as, to say the least, will render it less liable to be misunderstood.

I am, etc., GEORGE JOHNSON.

11, Savile Row, January 24th, 1865.

NEW INDIAN MEDICAL SERVICE.

SIR,—Your correspondent "D. J. G." obliges me, very much against my will, to reply to his remarks in the last JOURNAL; viz., "provided only he bases his advice on a fair representation of facts." Your correspondent appears to be fond of indulging in personalities, if I may judge from his favouring me a second time; though to what purpose, in a matter of this kind, I am at a loss to know.

I am not aware of having misrepresented facts. I compared the old pensions with Medical Rethring Fund, *versus* new *without*; and I proved the former to be far superior. I admitted the new pay was slightly improved; and promotion to the rank of surgeon after twelve years I declared a boon. At the same time, I stated that neither pay nor pension were at all adequate for transportation to a climate like India; and I added, that it was impossible for a married man to make a provision for his wife and children, taking into account sickness, education, and the increased expense of living in India to what it was; and I believe I proved that, with all the advantages the new service offers, it is far inferior to that of the Company.

I stated that the late dispatch created a new service, and those entering under it have no claim to any privileges of the old service; and that I would not advise any one trusting the Indian Secretary. But your correspondent "D. J. G." thinks I should inquire at the India Office. Nay, I have read the dispatch, and am not alone in my interpretation of it; but, as "D. J. G." has taken up the gauntlet for the Indian Secretary, I would advise him to get Sir C. Wood to publish the rules and regulations for the new service, as an explanation of his dispatch; for that it is read differently from "D. J. G.'s" reading of it, I would refer him to a letter from an "Indian Surgeon" in the last *Medical Times and Gazette*, condemning it far more forcibly than I have done.

"D. J. G." holds forth, as a lure to the unwary, the very exceptional case of Dr. Macpherson of the Madras army. He and all the deputy inspectors-general will be gainers by the new rules; and, in addition to all, will have £400 a year from the Medical Fund; but the case of Dr. Macpherson should not be quoted as an example in favour of the new rules, as he was most unfairly promoted over his seniors, some of whom had seen service in the field before he got his commission.

I never said a member of the Medical Board under the old rules could retire on a pension of £900 a year. "D. J. G." should read more calmly what I did write about £900 a year. Under the old rules, the highest pension was £700 a year, with £400 from the Medical Fund; total, £1,100, *versus* £550 under the new rules. If Sir C. Wood cannot get the assistance of a better advocate than "D. J. G.," he may well say, "Save me from my friends."

As regards my ignorance "on the subject of pensions in the British army," with which "D. J. G." taunts me, I find, on referring to the Warrant of October 1855, that your correspondent, who professes to know from circumstances so much of both services, either errs in his statement, or there are new

regulations since the Warrant was issued. As paragraphs 10 and 12 refer to retirement, under the former only is a medical certificate required; but, under the latter, "every medical officer who shall have served upon full pay for twenty-five years and upwards shall have the right to retire upon half-pay at the rate of," etc.; and I find the highest rate of half-pay (there is no such word as pension in the British service) is £736: 7: 6, not £600, as stated by "D. J. G."

"D. J. G." again introduces the subject of stoppages, and says he "alluded to another matter entirely", and quotes the case of a surgeon landing at Calcutta, his regiment being six hundred miles up country. Under the old rules, he drew no staff-salary until he joined; under the new, he gets what is now termed "unemployed pay on a liberal scale". But "D. J. G." does not give us both sides of the story. Under the old rules, we were allowed thirty days at Madras, going to or coming from Europe; and time to join, according to distance, at the rate of ten miles a day. Thus, if my regiment was six hundred miles away when I landed, I had ninety days to join in; and many of us took the full time out at the Presidency. *Sed tempora mutantur et nos mutantur in illis*. The thirty days are reduced to fifteen, and "to join by the most expeditious available mode of travelling, and without unnecessary delay on the road." I quote from a general order by the Governor-General of India.

I say again, once for all, the pensions are not sufficiently good to induce men to go to India, when they have no guarantee that faith will be kept with them; for Paragraph 20 of the dispatch reads very suspiciously as to services being dispensed with. It says: "You will, of course, take into account the several situations which may be properly filled up by uncovenanted members of the medical profession." Now, to my reading, many of the presidency appointments (the prizes of the service) must, according to this order, in future be filled by outsiders.

I am, etc., A RETIRED SURGEON MAJOR.

January 1865.

Medical News.

APOTHECARIES' HALL. On January 19th, 1865, the following Licentiates were admitted:—

Smith, Solomon Charles, Halifax
Turner, Frederick, Buxton
Woodcock, John, Roston, Ramsbottom

At the same Court, the following passed the first examination:—

Simpson, Thornton Gerald, Guy's Hospital
Watson, George Samuel, St. George's Hospital

APPOINTMENTS.

*COOKE, Wm. Harry, M.D., appointed Certifying Surgeon, under the Factory Acts, for the District of Aldridge and Walsall.
MAUNDER, C. F., Esq., elected Consulting-Surgeon to Queen Adelaide's Dispensary, vice James Luke, Esq.

MARRIAGE.

ALLEN—BARER. On the 19th instant, at St. Peter's Kirkley, near Lowestoft, by the Rev. Henry Willmott, incumbent, assisted by the Rev. John Allen, brother of the bridegroom, Joseph ALLEN, Esq., of Tombland, Norwich, to Sophia Augusta, daughter of the late John BAKER, Esq., Bengal Medical Service, of Noakholly, Bengal.

SUPERANNUATION OF UNION MEDICAL OFFICERS. The Lord-Lieutenant has appointed a day to receive the memorial from the physicians and surgeons of Ireland on the Superannuation of Union Medical Officers.

THE MEDICAL ACT. In the paragraph in the last number of the JOURNAL describing the proceedings of the Scottish Branch of the Medical Council, some important words were omitted in one of the sentences. The proposed amendment of the penal clause is as follows. "It shall not be lawful for any person, unless registered under this Act, to practise any branch of the profession, taking or using the name or title of a Physician, Doctor of Medicine, Licentiate in Medicine or Surgery, Master in Surgery, Bachelor of Medicine, Doctor, Surgeon, Medical Practitioner, or General Practitioner or Surgeon Apothecary, or Licentiate or Practitioner in Midwifery, or Professor of Medicine, or Professor of Surgery, or any other medical or surgical title; and every unregistered person so offending shall, upon summary conviction for such offence, forfeit or pay a sum not exceeding twenty pounds."

SUICIDE AND "THE VIGOUR OF HEALTH" GENTRY. Last week, an inquest was held at Higham, Kent, on James Miles, who was found drowned in the canal. The deceased was 24 years of age. A few months ago, he was rather queer in his manner, and appeared very low-spirited. About a fortnight ago, he received something which made him worse, was very desponding, and complained of his head and stomach. The police-constable who was present at the finding of the body found several papers and printed bills in deceased's jacket-pocket. Two are from Dr. De Roos, of Tavistock Square, and one from a Dr. Smith, of Burton Crescent, London. They are what are called quack handbills. At the residence of deceased, he found a pamphlet on secret diseases. J. J. Ely deposed: I am a surgeon, practising at Chatham. From an inspection of the papers found upon the deceased, I have no doubt whatever they would cause a great depression of spirits, and tend to a person committing suicide. Persons suffering from disease are susceptible to depression of mind. The papers or bills are issued by quacks. It is not unusual for cases of suicide to arise from reading pamphlets similar to those produced. The Coroner then read several letters from Dr. De Roos, which stated that the deceased must still continue with the medicine, and impressing upon him the necessity for remitting money, as he did not make it a practice to give credit to his patients; and stating that, in consequence of having numerous correspondents in all parts of England, he hoped he would not neglect writing to him, as he (Dr. De Roos) might forget the case. About thirty letters had been sent to the deceased in the course of ten months. The Coroner summed up. He said: Gentlemen, you have heard the evidence which has been adduced. From this it would appear that the deceased had in all probability been reading the pamphlets which have been produced; and you will have remarked that, on opening one of these pamphlets, the word "suicide" appeared written prominently round the margin. The number of letters from Dr. De Roos, of Tavistock Square—letters which it is impossible to stigmatise too strongly, and which, when read by the weak-minded, would lead them to the commission of suicide—must be noted as a weighty fact, and they tend to prove that the mind of the deceased had been deeply harassed by them. The jury returned a verdict to the effect that the deceased had committed suicide whilst in an unsound mind. After the delivery of the verdict, a consultation between the coroner and the jury took place, which resulted in the foreman intimating that they considered deceased's insanity to have been brought on by the perusal of certain pamphlets issued by and letters received from Dr. De Roos, of Tavistock Square, London. The coroner ordered that the pamphlets and letters should be kept in safe custody.

OPERATION DAYS AT THE HOSPITALS.

MONDAY.....Metropolitan Free, 2 P.M.—St. Mark's for Fistula and other Diseases of the Rectum, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.
TUESDAY. Guy's, 1½ P.M.—Westminster, 2 P.M.—Royal London Ophthalmic, 11 A.M.
WEDNESDAY.... St. Mary's, 1 P.M.—Middlesex, 1 P.M.—University College, 2 P.M.—London, 2 P.M.—Royal London Ophthalmic, 11 A.M.—St. Bartholomew's, 1.30 P.M.
THURSDAY.... St. George's, 1 P.M.—Central London Ophthalmic, 1 P.M.—Great Northern, 2 P.M.—London Surgical Home, 2 P.M.—Royal Orthopædic, 2 P.M.—Royal London Ophthalmic, 11 A.M.
FRIDAY. Westminster Ophthalmic, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.
SATURDAY.... St. Thomas's, 1 P.M.—St. Bartholomew's, 1.30 P.M.—King's College, 1.30 P.M.—Charing Cross, 2 P.M.—Lock, Clinical Demonstration and Operations, 1 P.M.—Royal Free, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.

MEETINGS OF SOCIETIES DURING THE NEXT WEEK.

WEDNESDAY. Obstetrical Society of London, 8 P.M. Dr. Snow Beck, "On Puerperal Fever"; Mr. I. Baker Brown, "New Mode of Securing the Pedicle in Ovariectomy"; and other Papers.
THURSDAY. Harveian Society of London, 8 P.M. Dr. Drysdale, "On the Antecedents and Treatment of Phthisis."
FRIDAY. Western Medical and Surgical Society, 8 P.M. Mr. George Naylor, "On Syphilitic Diseases of the Skin following Vaccination."

TO CORRESPONDENTS.

*. All letters and communications for the JOURNAL, to be addressed to the EDITOR, 37, Great Queen St., Lincoln's Inn Fields, W.C.

COMMUNICATIONS.—To prevent a not uncommon misconception, we beg to inform our correspondents that, as a rule, all communications which are not returned to their authors, are retained for publication.

CORRESPONDENTS, who wish notice to be taken of their communications, should authenticate them with their names—of course, not necessarily for publication.

K. R.—The little book entitled *A Few Words on the Choice of a Microscope*, is a reprint and revise from the *Quarterly Journal of Microscopical Science*. It is a very useful and well written essay on the subject of which it treats.

DOCTORS FOR SCAPEGOATS.—SIR: We must all thank you for your leader on the poor scapegoat, the doctor. Of course, what else was he made for? You have, in your leader, omitted to notice one thing. There is not sufficient work for the doctor in "necessary" visits; but he must be forced, if the orders of the Poor-Law Board are carried out, to do a great amount of work wholly unnecessary.

For instance, we all know that many chronic cases do not require a weekly visit; but the sapient powers at head-quarters decide that, whether they require it or not, every case on the book is to be visited *once a week*!

Where a surgeon has only limited time (and how many are there of this class), these unnecessary duties must be taken out of the time intended for necessary work. Again, the absurdity of filling up some of the columns in the weekly reports, consumes a great amount of time, which might be devoted to saving life; but, as your facetious contemporary *Punch* some two or three years ago remarked, union surgeons were not appointed for that purpose, if they were so foolish as to spend valuable drugs in saving life, when they were intended to get rid of it quietly, more fools they.

Possibly, Timothy Daly's case may prove the necessity for the reform which Mr. Griffin has so long been labouring at—the placing all medical officers on a similar footing. How many union appointments are better paid than that which Mr. Norton holds?

I am, etc., A POOR-LAW VICTIM.

ADVERTISEMENTS.—The following advertisements appear in the *Lincoln Gazette*.

[A Card.]

Mr. Fred. T. Mason, Surgeon and Bone-setter, 123, High Street, Lincoln.

Medical Notice.

Mr. Thomas Elkanah Hoyle, Surgeon, etc., begs to inform the public that he attends midwifery cases for 10s. 6d. Mr. Hoyle has had great experience in diseases of women and children.

Clinical Lecture

ON

VENESECTIONS.

BY
W. O. MARKHAM, M.D.,
PHYSICIAN TO ST. MARY'S HOSPITAL.

GENTLEMEN,—I have to-day to bring under your notice two cases which, as I think, illustrate in a striking way the beneficial effects of venesection. In both cases, the patients were suffering, and suffering severely, from lung-diseases; and in both the symptoms for which the venesection was practised were those which represent in a marked degree interference with the free play of the heart and lungs. I will, in a few words, relate the history of these cases; and then make a few remarks touching the operation of the venesection in their cure.

J. J., aged 36, a healthy man, was seized, about a week before his admission into St. Mary's Hospital, with difficulty of breathing and "stitch" in the right side. These symptoms increased up to the time when he entered the hospital. When I saw him, the morning after his admission, he was sitting up in bed, fighting for breath, and, as he expressed it, felt almost suffocated. His pulse was rapid; his tongue moist and coated; and his face livid. He had been delirious during the night. An examination of his chest, hastily made, showed us that he was the subject of double pleuropneumonia, and that there was complete dullness on percussion before and behind over at least three-fourths of the right lung. Now, if ever one might have ventured to predict, from a consideration of symptoms and physical signs in such a case, that the patient was being surely and rapidly asphyxiated; and that, unless some immediate and great relief were quickly given him, he would inevitably perish, assuredly one might have done so in this case. Guided by this impression, and considering that the man had only been ill a week, and had previously enjoyed good health, I ordered him to be bled at once, and freely bled—i. e., until he showed signs of relief or fainting. I may here remark, as a curious sign of the times we live in—of the revolutions which periodically occur in medicine, as well as in all other things—that the house-surgeon had never bled a patient, nor had seen a lancet used in bleeding! About sixteen ounces of blood were taken from the man's arm, to his very great and immediate relief. The pain in the right side (where the pleuritic symptoms were most acute) returned again in the evening, and therefore some eight to ten leeches were then applied. Next morning, the man was, comparatively speaking, in a most comfortable state. He no longer suffered from those urgent, and, as I deemed them, fatal signs of distressed breathing, which afflicted him the day before.

And what had brought all this so great relief to him, if not the venesection? Surely, if in any case we may draw conclusions that the relief given in disease was the result of the remedy administered, we may do so in such a case as this, where the nature of the disease is so manifest, where the relief following the remedy is so undoubted, and where it follows so immediately upon its use. More than this: it may

be asked, Is there any other remedy besides venesection which could in such a case have produced relief so great, and so immediate? Well, then, unless we choose to shut our eyes to as palpable a fact as any which can be produced in the matter of the action of the therapeutical agents, it seems to me that we are driven to the conclusion that venesection is, *in such a case*, the most sovereign and life-saving of remedies; that, in the instance before us, it had rescued the man from impending death. I do not intend to follow out the history of this man's case through his long convalescence. I will only add that, in addition to the double pleuropneumonia, he was afterwards attacked with pericarditis; and that subsequently a pleuritic abscess of the right side opened into, and discharged its contents through, the lungs and the trachea. Notwithstanding all this long catalogue of serious affections, he eventually left the hospital convalescent.

The other patient, alluded to as illustrative of the beneficial uses of venesection, was an adult man, who had occasionally suffered from "asthmatic" symptoms. When he entered the hospital, he breathed with much difficulty, and, in fact, suffered "excruciating" pain in the left side. His respirations were 50 in a minute, and his pulse very rapid. His disease was pneumonia of the left side. He was immediately bled to about fifteen ounces, and was as immediately relieved of his great distress. I will only add of him, that he thereafter rapidly and satisfactorily recovered from the attack, and left the hospital cured.

Now, I call your attention to these two cases, because they seem to me, as far as they go at least, to show the error of the present "extreme in practice", which virtually abolishes venesection from our list of therapeutical agents. I believe that in one of these cases, at all events, the man would inevitably have perished, had he not been bled.

You know the modern theory about bleeding, or rather I should call it the present prevailing theory: for it is in no way modern. It is this: that diseases have changed their type; and that men of these days will, therefore, not bear bleeding as men did thirty or forty years ago. I have elsewhere shown,* and, as I think, shown demonstratively, that this theory is a mere scapegoat which men have made use of as an apology for their own apparently inconsequent conduct—in order, in fact, to explain how it is that they no longer employ venesection as they once employed it in other and darker ages of medicine. I have asked and sought for the *proof* of the assertion that men will not bear bleeding now as they did in those other days; and I find it utterly wanting. I find that the assertion is founded on some indefinite kind of belief—on ordinary medical belief—in fact, on mere surmise and opinion. If you ask men for anything like a reasonable *proof* of the opinion, you ask in vain. I showed, in the lectures referred to, that this idea of an incapacity of man to bear bleeding was flourishing upwards of a hundred years ago—has, indeed, flourished at intervals during all ages, and has been handed down from physician to physician through generations past. A hundred years ago, Hunter tells us that some of the physicians of his day discovered, just as physicians of our own day have done, that diseases would not bear bleeding as well as they did formerly. Medicine is

* See Gulstonian Lectures, BRITISH MEDICAL JOURNAL, APRIL 3, 16, 23, 30, and MAY 7, 1864.

continually repeating its own errors. At this moment, however, I only ask you to keep these two cases—surely I may call them these two facts—in your eye, when you may be tempted at some future day, and in an urgent case, and contrary to your own judgment, to forego venesection solely because you have a dread of this bugbear of a change of type in disease—of some modern incapacity of human nature to bear loss of blood. Just reflect again on what you here see going on around you daily and hourly in this matter of loss of blood. Look at patients, after accidents, lying in our surgical wards blanched through loss of blood. Note the enormous quantity which often wells away from women during labour; measure the black vomitings of patients suffering from ulceration of the stomach, and the bloody sputa sometimes thrown up in tubercular disease of the lungs; note the large dejections of blood which often accompany ulceration of Peyer's glands in typhoid fever: note all these, and many other sources of often most copious hemorrhages which you see going on daily under your eyes in the hospital; and note also that the patients recover, and recover rapidly, from the effects of such large hemorrhages. Mark how little they exhibit of that incapacity to bear loss of blood which they ought to exhibit if there were any truth in the theory that we are now living in an asthenic phase of diseases. More than this: I might ask you to observe the very great relief which these spontaneous hemorrhages often bring with them, especially in those cases of disease in which the lungs and the heart are concerned.

Well, gentlemen, if you will note all these facts, and then carefully reflect upon them, you will, I am sure, at all events, have your belief greatly shaken in the truth of the idea that to take a few ounces of blood from a man by the lancet is something akin to taking the very life out of his body. These reflections will shake your confidence in the truth of the theory upon which is based the modern practice of non-bleeding in disease. And then, if you will also call to mind the markedly beneficial effects following the bleeding, and noted by your own eyes, in the two cases here spoken of, you may probably be induced, on proper and fitting occasions, not to fear to resort to this most excellent of remedies. This is the lesson which I have wished to impress upon you to-day.

And one word more, let me say, as to the probable action of the venesection in cases of this kind. The idea generally entertained on this point is, I believe, quite erroneous, and, what is worse, an error, which prevents the use of the remedy. It is thought that venesection is of service in inflammatory diseases, through the beneficial influence which it exercises over the local inflammatory process. I believe there is no proof whatever that venesection has any directly beneficial influence over any inflammatory process.

If venesection be of service in internal, it should equally be of service in external inflammations—i.e., in those inflammations whose progress we can see with our eyes. But in what records of "bleeding" times, will you find any satisfactory proof that it ever was of service in such inflammations? And where will you find an authority of the present day to tell you that he has seen the benefits of venesection in external inflammations?

The truth is that, in past days, when venesection was in its glory—I mean gloriously abused—you will ever find that its benefits were most loudly pro-

claimed in those internal inflammations in which the action of the lungs or heart was impeded; and, assuredly, at the present day, there is never any pretence or thought of bleeding a man, except in those diseases in which the respiratory or circulatory organs are directly or indirectly affected. Facts like these, and other facts which I have not time now to tell of, indicate *a priori* the correctness of the proposition I here make to you; viz., that venesection has no directly beneficial influence over the inflammatory process itself; but that it is of benefit, by removing some of the accidents which arise secondarily out of those inflammations and diseases—viz., the impediments to the free play of the lungs and heart. No one ever did, or ever does, think of bleeding in pneumonia, unless the pneumonia be so extensive as to seriously interfere with the play of the heart and lungs. Men always did, and always do, judge of the necessity for the venesection by the amount of impediment to the action of those organs displayed in the physical signs and symptoms which indicate the impediment and the nature of it. The benefits of the bleeding, as I see the thing, are not the result of any good effected by it at the seat of the inflammation—of any good directly effected by it over the inflammatory process. Its benefits are rather to be ascribed to the freedom of action—the relief given by it to the play of the other, the uninfamed parts of the lungs and the engorged heart—of the organs or parts in fact which have become secondarily engorged, i.e., impeded in action, in consequence of the inflammation. The bleeding neither arrests nor alters directly the condition of the inflammatory process.* It neither cuts the inflammation short, nor can it remove the exudations which are the necessary attendants of inflammation. In what possible way can bleeding alter directly the condition of a consolidated portion of lung? In the case of J. J., the bleeding most assuredly effected no instant change in the state of the inflamed parts of the lungs and pleura. But nevertheless the relief given by it was immediate—came whilst the blood was flowing from his arm—as it probably always comes, if the bleeding be of any service at all. Also, remark that the relief here given is just of the same kind as that which is given in cases, for example, of chronic diseases of the heart and of thoracic aneurism; in cases where impediments to the action of the heart and lungs, or, in other words, congestion of the heart and lungs, have suddenly arisen, and where inflammation does not exist. Hence, therefore, when bleeding is of service in the course of inflammatory diseases, it is so, not because it directly alters the inflammatory process, but because it relieves certain of the accidents which arise incidentally out of the inflammatory process—i.e., the congestion of the heart and lungs. Bleeding therefore, it may be said as a corollary of this, is of service only in those inflammations and diseases in the course of or out of which arise impediments to the play of the heart and lungs.

But, after all, let no theoretical arguing draw us away from the patent fact which we have seen with our eyes. We saw a man, to all appearance *in extremis*, fighting an unequal battle with disease. We found him to be the subject of double pleuropneumonia. We saw an immediate stop, then and there,

* Of course, excepting in so far as by modifying the general state of the system, it may modify the general forces which are concerned in or preside over the process.

put to the violence of this deadly struggle by bleeding. We saw the man recover from the moment of the bleeding. You may have heard him declare that the bleeding was the saving of his life—though you need not perhaps take any great account of a patient's opinion on such a point. You have seen all this. Well, gentlemen, I trust I have a sufficient sense of the fearful amount of fallacies which beset our medical reasoning—of what Dr. Barclay calls our “medical errors”—I believe I have a sufficient dread of the proverbially reigning confusion in our ideas of the *post hoc* and the *propter hoc* in matters therapeutical. But I think a man must be sceptical indeed, beyond all bounds of reason and common sense (if we may invoke that sense here), who refuses to connect effect with causation, the consequence with the antecedent, the cure of the disease with the venesection, in the cases I have to-day brought under your notice. And this one other word let me add suggestively, What other remedy do you know of under the sun which is capable of producing off-hand, then and there, such great results in such formidable disease?

Original Communications.

ON VITAL FORCES.

By JAMES RHODES, Esq., Glossop.

WITHOUT much preface, I intend to state my views upon the question of the origin of the motor or vital force in the living organism.

I am not aware that any more appropriate term can be given to designate this subject than physico-vital dynamics.

It is no less true for the human system than for the external universe, that *no force can be lost or destroyed*, and that *no force can increase in any degree that which exists*. When a force or power of motion has once ceased to act in one particular manner—as *vis viva*, or mechanical force, light, heat, or electricity—it becomes transformed into some of the other forms of force, according to the relation which the surrounding parts possess in influencing the conversion. A good instance of this fact is mentioned by Professor Grove, in his work on the *Correlation of Physical Forces* (page 58).

I shall attempt to trace out the changes or conversion of forces which take place in the human system.

Without doubt, the prime moving force in all Nature is that which started worlds into existence—a First Cause, producing the law of gravitation in the heavenly bodies, and called by Mayer, Tyndall, and others, *vis viva*. Now, when this *vis viva* becomes arrested, an equivalent proportion of heat is produced; and the discovery of its equivalent may hereafter give us a key whereby we may estimate the value of any of the chemical agencies acting in the human economy.

The mechanical equivalent of heat is equal to 772 foot-pounds for 1° Fahr, and was discovered by Mayer, a German of our profession, and by Joule of Manchester, whose labours were carried on independently and without the knowledge of each other.

The leading philosophers now consider that one main force now exists. It is not my intention to dispute this important point, but it will be necessary to coincide with them. Yet the most uninitiated

can ask, How can there be variety of forms out of one force? According to the more advanced philosophers, there exists a grand central force, round which systems of worlds revolve; and the light which emanates from the central bodies or suns of these systems is created by the very force which causes the revolution of the earth round our sun. It is not necessary here to enter fully into the subject of forces as they exist in external Nature, but the same laws apply to them in the human being; and I shall simply state the order and relationship which they possess to each other.

A gravitative force is established by the Great Unknown, which force is called *vis viva*. It is now discovered that a body falling to the earth will produce a certain equivalent of heat by the gravitative or moving force, which by this means becomes arrested and changed.

The following is an outline of the order in which I propose to consider this subject.

1. A close relationship exists between chemical force and the force of gravitation; and, under certain conditions, each of these produces heat and electricity—the former, the voltaic form; and the latter, frictional electricity.

2. A correlation between heat, light, and electricity is found to exist in the world around us; and it remains to be shown how these are connected and related in the living body.

3. It is not too much to expect that, as science advances, the total value of all these may be ascertained. The voluntary principle of man cannot create more force than is produced by the changes effected by the oxidising or chemical process in the system; otherwise exhaustion would be unknown, and sleep would be dispensed with.

4. There is the same correlation of forces in the human body, and these take their origin from simple motion, or *vis viva*; the attractive force existing in carbon, hydrogen, oxygen, phosphorus, etc., becoming converted into heat and nerve-force. These two are correlated, just as are heat and electricity. I do not consider that electricity and nerve-force present exactly the same phenomena; yet they are closely related, and almost identical.

5. I hope to show that heat and nerve-force are produced from the same origin; and that heat is not essentially, if at all, converted into nerve-force, as stated by Dr. Richardson; but that they are distinct at their origin, and that the nerve-centres are supplied with their force through afferent nerves—i.e., cerebro-spinal and sympathetic—as well as that generated within the brain itself. This nerve-force becomes expended, as in walking, through the motor nerves, and it is, *a priori*, likely to be conveyed along the afferent nerves just in the same amount; but, without a knowledge of these facts, it would be difficult to understand how or why.

I think the results of the following experiments sufficiently prove the origin of nerve-force.

Most of the readers of the JOURNAL are conversant with the experiments of M. C. Bernard upon the sympathetic nerves, whereby he made known the facts of their “calorific and vascular” influence. When a branch of the sympathetic nerve is divided, the vessels are paralysed, and no longer oppose active resistance to the pressure of the blood; they become expanded, from loss of the contractile power of the capillaries, and a suspension of nerve-current to and from the capillaries.

The fact of an exaltation of temperature to 6° or 8° cent. indicates that what is lost in the non-production of nerve-force is converted into heat, or the *plus* heat is equal to the *minus* nerve-force lost, as shown by the loss of contractile force of the capillaries of

the part. I consider that the nerve-force generated in the healthy capillaries is conducted to the nerve-centres and ganglia; and that some of this force is returned to produce contraction of the capillaries, whilst the rest is applied in voluntary and involuntary purposes of life.

This view is greatly supported by the experiment of ligature of the femoral artery, and section of the sympathetic nerve on the same limb. We now find a reduction of temperature, with diminished sensation; whereas, in the former experiment, we find exaltation of temperature and sensibility.

The immediate effects of closure of a large artery by ligature or embolus are well known; viz., coldness and diminished sensibility of the limb. I cannot agree with Dr. Richardson in considering heat added to the body as altogether sufficient to keep up the functions or vitality of a part or organ. If such were the case, heat applied to a limb, as in the above experiment (of ligature), would restore its sensibility. If the heat applied were converted into nerve-force, the sensibility of the limb would be restored to its former condition by such addition before the renewal of circulation in the part takes place by collateral means. But we know that sensibility does not return until the collateral circulation has become established; and, therefore, that the afferent nerve-force of the part which is essential to carry an impression (as a prick or burn) to the brain is supplied when the limb is re-supplied with fresh blood to its capillaries.

Dr. Richardson, in his communication on the "Physics of Disease", appears to object to the term nerve-force and muscular force. In all cases, those terms are the best which convey to the mind a clear idea of an object or thing, although this may be able to assume numerous forms under varying conditions; as by the terms steam, vapour, rain, snow, hail, or ice, we signify the various forms assumed by water. In the same manner, it is just as correct to speak of nerve-force and muscular force, since we understand that these are correlated or changed into each other; and so it would be convenient to give a dozen other names, if force within the body assumed as many characters. Therefore, it is quite proper to give generic terms when force is made to assume its peculiar generic characters.

In speaking of the action of light falling upon the retina, sound upon the tympanum, and the chemical influence of touch, he says: "The motion of the body, in all that pertains to its own power of action, is through heat." I have elsewhere shown that heat is not converted into nerve-force. If it were converted, we should not hear of the exhaustion produced by extreme heat. We all know of the prostration produced in the body by the great heats of summer, and the strength of body evinced on a winter's day.

No doubt it is a beautiful and wise arrangement, that the two forces arise together; for the sense of touch is increased with the increased temperature of the skin. Yet heat, light, and sound do not constitute true nerve-force; they are excitants; they are received upon the skin, eye, and ear, and produce corresponding impressions on the brain. We know that people die from excessive heat. The dial in electric telegraph operations is moved by the commutator; and a corresponding movement is noted at the other end of the wire or station. It is the force generated in the battery which is used up in the production of messages; so, in the system, it is the impression of a commutator, so to speak, upon the skin, or any impression received by any of the special nerves of sense, which is conveyed by the force which is in continuous formation, and is impressed

upon the brain. It is impossible to see how the prick of a pin can impart force to a muscle. No doubt it causes an expenditure of force by the muscular contraction which follows through reflex action. If a pin could generate force, a stout cudgel well applied to an animal would be an economical substitute for hay and corn.

I have thus shown that heat and nerve-force have their own distinguishing characters at their origin. I also consider that there is developed at least the same amount of heat, in proportion to the mass of matter in the brain, as occurs in other highly vascular parts of the body. A proof of this is shown when the bulb of a small thermometer is introduced into an animal's brain. If the sympathetic nerve in the neck is divided (Donders's experiment), the temperature of that side of the head, and also the brain, is increased in like manner; thus showing the correlation of that force which is generated in the brain, and heat.

In the number of the BRITISH MEDICAL JOURNAL for September 17th, 1864, a few remarks occur. M. Pontevez states, that the hot and red skin is produced by relaxation of the blood-vessels, just as it is produced after division of the sympathetic. The cause of this increased temperature can readily be understood by reference to statements before made; and the only remaining means likely to produce increased temperature are, increased friction by greater blood-current, and by increased combustion by great admission of more blood into the capillaries of the part. Now, by the discoveries of the mechanical value of heat, and of the known quantity of heat evolved by combustion of carbon and hydrogen (the former by Favre and Silbermann, and the latter by Grassi), we have a ready means to estimate the amount of heat capable of being produced by both these means. To give the figures in proof of this would take up much space.

When the half of the spinal cord in the lumbar region is divided, increased sensibility of the limb ensues; and this strongly convinces me that this increased sensibility of the limb, or increased afferent nerve-force, becomes collected, and the limb highly charged with this force, derived from the peripheral extremity of the nerves.

To conclude this brief account: I consider that the sympathetic and sensitive nerves are supplied at their peripheral or afferent extremities with their peculiar functions and forces. Their functions are to receive impressions, as touch, vision, hearing, smell, and taste. And these two classes of nerves are here connected by ganglionic nerve-cells. The derivation of the nerve-force supplied to the nerves of special sense, and the function produced in each of these, will be, in my opinion, as follows. The nerve-force generated by chemico-vital action in the capillaries within the eye is conveyed to the retina by the expanded layer of ganglionic nerve-cells which are found spread upon its surface; and hence, light falling upon the retina, the sensation of an image is conveyed to the brain by the force generated, not in the nerve-centre, but in the eye. This instance will serve to explain what is effected in the other organs of special sense.

It is an established law in physiology, that the development and functional activity of an organ is in direct ratio to the abundance of arterial blood which is sent to it. This is seen by the excited condition of the pneumogastric nerve during digestion, when the amount of blood to the stomach is much increased. The opposite condition is seen when part or organ is deprived of its arterial blood. Thus the functions of the brain are checked when all the arteries which go to it are tied, and return again

when blood enters one of them. Instances are recorded of fetuses born without brains and with only rudimentary spinal cords, and yet whose hearts have continued to act.

CASE OF TRANSMISSION OF SECONDARY SYPHILIS: WITH REMARKS.

By THOMAS SKINNER, M.D., Liverpool.

[Communicated to the Medical Institution of Liverpool, April 14, 1864.]

On the 20th of September, 1861, I was consulted by a lady in reference to her first confinement. She was suffering from pruritus vulvæ, arising from a simple non-specific herpetic eruption on the vulva, which was cured in a week or two by diet and simple tonics, directed to improve the digestive organs. On the 4th of February following, she miscarried of a viable child, which, although seemingly healthy, died within a fortnight of its birth. The mother has had no return of the vaginal or vulvar irritation up to the present moment, and has enjoyed better health during all that time than has been her lot for some years before.

On the 3rd of July, 1862, she again conceived, went the full time of gestation without a single abnormal symptom, and was delivered of a rather puny-looking female child on the 10th of April, 1863. Within a week after birth, the child exhibited unmistakable signs of hereditary syphilis in an exaggerated form. On both hips, and around the anus and vulva, there was a florid red eruption, in rounded patches of various size and extent, each patch being raised above the level of the surrounding skin; and on the worst and most florid parts an ichorous discharge issued, which seemed to inoculate the sound skin, greatly extending thereby the diseased surface. Over the whole of the body a roseolar rash appeared, covered more or less with minutes scales, unaccompanied with itching. The whole of the mucous membrane of the mouth, lips, gums, fauces, and nostrils, became excoriated. The lips and gums, particularly the angles of the mouth, bled on the slightest touch; and they were always moist with a muco-serous exudation from the broken surfaces. Aphthous deposits were visible every where, but chiefly on the tongue and buccal mucous membrane. The child began to emaciate rapidly; and the mother's milk disappeared, apparently from grief at seeing her infant in such a frightfully diseased condition; so that we were driven to the alternative of substituting a wet-nurse. A strong healthy wet-nurse was obtained; the child was put upon grey powder; the diseased mucous and cutaneous surfaces were dressed thrice daily with a weak solution of the acid nitrate of mercury; and in three weeks the child was free from any appearance of disease; but, as it was still weak and delicate, I sent it, with the nurse and father and mother, to the coast of North Wales, where it thrived well, and remained quite well for a month, when a slight threatening of the eruption reappeared on the hips and vulva, with at the same time *ozæna*. A few more powders of chalk and mercury, and applying the lotion of the acid nitrate locally, again removed all trace of the disease within a week. The child has been weaned, and is now thriving better than ever, being both fat and plump.

So much for the disease in the child. But how did it come by it? As I have already stated, the mother never manifested a trace of syphilis, either locally or constitutionally, during either of her pregnancies; and from the 20th of February, 1862, until the present date, she has never had any discharge, sore, or other local disturbance of the genito-urinary organs.

I at once suspected the husband; and I told him of my suspicions, when he candidly confessed that he had contracted the disease by a primary sore on the penis eight years ago; but, as he had undergone a thorough salivation on more than one occasion, he thought the poison had been eradicated from his system. On making further inquiries about his present state of health, I found that he was still the subject of constitutional syphilis. The form in which it now manifested itself was that of chronic syphilitic ulceration of the tongue, coming and going, not yielding to ordinary tonics. I examined the ulcers; and, judging from their characteristic ash-coloured surface, combined with the fact that they had come and gone for eight years independent of external causes, I have no doubt in my own mind that the husband was the cause of the disease in the child. He has since been cured to all appearance by iodide of iron, baths of nitro-muriatic acid, and an occasional mercurial purgative.

Having now accounted for the disease in the child, let us turn to the wet-nurse. The child had not been a week at the breast when, with one of its nails, it injured or broke the skin a little below the nipple. Every care was taken of this broken surface, by means of cleanliness, etc.; but I fear they were too late of adoption, and that some of the saliva or the secretion from the excoriated lips of the child inoculated the wound. The wound did not heal kindly: more or less of a suppurative tendency showed itself. It healed with simple dressing within a week or ten days; and the woman went with the family to the coast, and remained out of my supervision for about four weeks. On her return, she was covered from head to foot with a roseolar rash, the same as I observed in the child a few days after its birth. On the back of the neck, and on other parts, the peculiar copper-coloured eruption of secondary syphilis was present; but I was very unwilling to believe it. Partly at my own request, and partly as it was the wish of the family, a second opinion was taken. The physician who met me was one who has had a very large experience of syphilis, and he at once pronounced it a genuine syphilitic eruption; in fact, he pronounced it so even before he had heard the history of the case; and I believe he was perfectly right. The wet-nurse was immediately put upon a course of mercurial purgatives, which removed all trace of the disease in about six weeks, without affecting the breast-milk otherwise than by increasing the quantity of the secretion. At this date, she remains perfectly free from any trace of the disease.

REMARKS. I am fully aware that, so far as the profession as a body is concerned, we are far from being unanimous as regards the question of the possibility of the transmission of secondary or constitutional syphilis. My object in bringing this case before you is to strengthen our belief not only in the possibility, but in the certainty of such transmission; as also that we may see how deeply we are interested in the subject in a legal sense, as regards the general management of such cases.

The case I consider quite equal to an *experimentum crucis*; and I feel perfectly confident that every avenue leading to deception or mistake has been strictly guarded. I can vouch for it that, during these two years, neither locally nor constitutionally has the mother ever manifested any appearance of a primary syphilitic sore or sores; and far less has she shown any symptom at all approaching to constitutional syphilis. I can also testify that, during the same period, she never was treated with any anti-syphilitic agent. If you ask me how the mother escaped contagion, I answer that I know not. All that I can say is, that this case is not the only one

on record where a child has been born, not only with hereditary syphilis, but with scarlatina, variola, rubella, and other contagious diseases, and where the mother showed not the slightest trace of any of these affections during or after gestation. Mr. Victor De Méric, in his Lettsomian Lectures in 1858, states that, out of twenty-three cases of congenital or infantile syphilis, "he perceived that in *thirteen the mothers who had given birth to them remained in perfect health.*" That the disease was syphilis in the child I make no doubt. My description of it; the effect of the mercurial treatment, local and constitutional; and the fact of the father having had syphilitic ulceration of the tongue for eight years,—are strongly confirmatory.

Lastly, of the wet-nurse. Before she was engaged, I examined her as I would any other wet nurse, and found her in every respect a very healthy woman, with the finest breast of milk that I ever saw. From motives of prudence, we did not institute a vaginal examination of the woman *after* the syphilitic eruption appeared; but, on inquiring of the servants who washed her linen, and from actual examination of the linen, there was never found any trace of matter or discharge of any kind upon her thrown-off under-clothing. What goes still further to prove this point, is the fact that the secondary symptoms showed themselves when she was in North Wales; an interval of four or five weeks having elapsed from the time that the child scratched the left breast.

RETROSPECTIVE NOTES ON OUT-PATIENT PRACTICE.

By C. M. DURRANT, M.D., Physician to the East Suffolk and Ipswich Hospital.

[Continued from p. 85.]

6. *Emphysema.* We have had a few well marked examples of this disease in the past two years. Like asthma (although depending upon very different pathological causes), its symptoms are very capricious; and it is striking to see what liberties, in reference to diet and exposure, a patient may take in one locality, while, in another, the most vigilant care is futile in warding off an attack. As it is now very generally believed that the pulmonary lesion is produced by over-forced expiratory, rather than by inspiratory effort, it behoves us to caution the labouring poor against an employment that will call for violent exertion while the breath is temporarily suspended, as in pushing or lifting heavy weights, etc.

Emphysema, whether vesicular or interlobular, is best relieved by strict attention to the general health. Flatulent dyspepsia will naturally much aggravate the attack of dyspnoea; and, as a rule, both in this complaint and in asthma, I have found the recommendation of Dr. Salter a very valuable one—viz., to debar the patient, as far as possible, from taking food after the middle of the day. The breakfast and mid-day meal may be substantial; but the lightest allowance, both in quantity and quality, should be taken in the evening. As a rule, also, I believe that stimulants, in the shape of wine or malt liquor, are better avoided.

Although the general application of blisters is thought to be questionable, I have certainly seen much relief obtained from a blister applied to the epigastrium. It operates partly, I imagine, by relieving gastric congestion, but more especially by the direct influence which it exerts upon the semilunar ganglion and branches of the pneumogastric nerve.

As medicines, alkalies and chloric ether are beneficial, and sometimes cod-liver oil may be given with

advantage. I have seen also very great relief to the dyspnoea, both of emphysema and asthma, obtained by liquor arsenicalis, continued for some length of time.

Smoking stramonium and tobacco may be of temporary service; as is also the inhalation of the fumes of paper prepared with a saturated solution of the nitrate of potash.

It will be often found, however, in private practice, that a carefully regulated diet, with warm clothing, and residence (if possible) in a dry atmosphere, will effect more in reference to the patient's comfort than we shall be able to afford him by medicinal treatment. The strict avoidance of constipation is, I think, a matter to be attended to in the treatment.

CIRCULATORY SYSTEM.

1. *Hyperæmia.* Under the denomination of congestion, we have a large number of cases noted as having applied as out-patients in the two years.

The symptoms at once point to the cause; viz., a more or less loaded state of the capillaries throughout the body, turgescence of the veins, and a dark purple appearance of the mucous membranes. With these, there is generally, also, a thickly coated tongue, and all the symptoms of congestive dyspepsia. Among the out-patient poor, the actual quantity of blood is probably increased as far as its watery constituent is concerned; while, among the more wealthy, indolent, and free-living, the quality rather than the quantity of the blood is changed, and this by increase both of the fibrine and also of the red globules.

The hard working "servant of all work" appears to me to be particularly prone to this hyperæmic condition of the circulation. In two cases, in this class of life, which were severe, I prescribed venesection with great advantage.

In general, a light diet without stimulants, free purgation by saline aperients, and the following mixture (*Ph. Lond.*), will be all that is necessary.

R Potassæ bicarb. ʒiss; potassæ nitratis ʒss; tincture colchici ʒj; spiritus ammon. aromat. ʒiss; spiritus æther. nitr. ʒij; mistura camph. ad ʒviij. M. Sumat. partem sextam ter die.

2. *Valvular Disease of the Heart.* The most frequent form of cardiac disease that has obtained is lesion of the valves. Of these, the mitral have been most often affected; next, the mitral and aortic; then, the aortic singly; and in one case, the semilunar pulmonary were alone implicated.

None of these cases were of recent date; and the majority could be traced to a rheumatic origin. In the treatment of mitral valve disease, the daily toil and struggle to live among some of the poor almost hopelessly negative our attempts to relieve.

Regulating the digestive function, allaying flatulence, and keeping the liver tolerably empty by the steady use of aperients, and giving iron in combination with alkalies, will, I think, be found the best general treatment of this affection.

In the treatment of the aortic lesion, which is far more hazardous to life than the former, I have found the following formula of Dr. Barlow certainly afford much relief, although it is difficult to say how it acts.

R Tinctura hyoscyam., spiritus ætheris nitr., a ʒij; decocti senegæ ʒvss. M. Sumatur pars sexta ter die.

I have added bicarbonate of potash to the mixture if the digestive organs be faulty. If the patient be anæmic, steel is indicated; and in one case arsenic appeared to do much good. The dropsy, depending upon valvular lesion, obtains only in a limited extent among the out-patients; inasmuch as when

it is severe the patient is necessarily confined at home.

The time-honoured combination of blue pill, squill, and digitalis, will still hold its ground, in many of these cases, as a remedy of much value. Iron combined with saline aperients, and diuretics, are also proper.

Elatarium is more suited to renal than to cardiac dropsy; but, in obstinate cases, if its administration can be watched, it may sometimes be given with much advantage. To relieve congestion of the heart itself, dry cupping, frequently repeated, over the præcordial region, may be adopted; and I think that I have seen benefit derived from constantly wearing a belladonna plaster. In very chronic cases, with much pulmonary distress, in addition to alkalies and antispasmodics, small doses of the bichloride of mercury, continued persistently at bed-time, will often give relief.

I need scarcely add, that cold and moisture must be guarded against with the greatest vigilance, as in no disease is their depressing influence more, and often irrecoverably felt, than in valvular lesions of the heart.

3. *Dilatation of the Heart.* Two or three well marked examples of this lesion have occurred; and, referring to notes from private practice, I am disposed to think that the disease is on the increase. In the great strain to which the muscular fibres of the heart are subjected, and the exhausted nerve-power, as the consequence of mental and bodily wear and tear, with, in many instances, overwhelming anxiety, there is, I think, in the hurried habits of the present day, more than sufficient to engender this lesion.

In the treatment, steel and digitalis are our sheet-anchors; and with these medicines, I have combined small doses of strychnia. I am quite convinced of the great value of digitalis as a cardiac tonic; and in cases in which the action of the heart is exceedingly weak and fluttering, it will often be productive of the best result.

4. *Palpitation.* This affection, which is rather a symptom than a disease, is interesting more particularly in reference to its diagnosis. Both sexes have afforded instances as hospital out-patients.

In the female, the cause has been chiefly traceable to mental emotion, insufficient food, debility, hæmorrhage, leucorrhœa, and too close confinement—all tending to produce anæmia, with disordered nerve-tone. In the male, dyspepsia is a fertile excitant of functional palpitation; too rapid growth; excessive indulgence in stimulants; and sexual abuse; and perhaps more prejudicial than any of the above is the baneful and disgusting habit, among all classes and ages of the present day—viz., the almost universal and immoderate smoking of tobacco. I have had several cases under my care, in which I was distinctly able to trace as the effect of constant smoking, the miserable train of nervous feelings, together with the loss in a great measure of virile power, for which I was consulted. One more cause of inorganic palpitation, common to both sexes, is commencing scattered general tubercularisation throughout the lungs.

In forming a diagnosis, we must take into consideration all the collateral circumstances of the patient's life; the absence of the signs of organic disease; the return at intervals to natural and quiescent action of the organ; and the improvement which we shall generally see result from judicious treatment. A transient *bruit* will often be audible at the base of the heart; and, if its action be very violent and irritable, this may be communicated more or less towards the apex, without being indicative of organic disease.

5. *Aneurism.* One case of this affection, occurring in a female, has been observed in the two years. Although the aneurism did not protrude tangibly, still the phenomena were sufficiently marked to warrant the diagnosis of the existence of an aneurism of the aorta.

The patient was about fifty years of age, stout; purplish cheeks, and mucous membranes generally. She suffered from constant dyspnoea, greatly aggravated by exertion; faintness, at times amounting to syncope. With this, she had substernal tightness, and a feeble but not unsynchronous pulse. Some dulness was elicited on percussing the upper sternal region; and there was a systolic *bruit*, feebly audible both at the upper sternal and right interseapular regions.

This patient's dyspnoea was so much benefited by taking the senega mixture above referred to, that she persisted in visiting the hospital once a fortnight (although repeatedly advised to the contrary), having to travel on each occasion six miles in a carrier's cart. I think, but I am not quite certain, that this patient has since died suddenly.

DIGESTIVE SYSTEM.

1. *Dyspepsia.* Following the plan of noticing diseases in each class in the order of frequency of occurrence, we at once find dyspepsia taking the lead as the most common disorder we are called upon to treat. In the forms under which it most frequently obtains, it may be conveniently divided into two varieties—the irritative, and the dyspepsia of debility, or defective nerve-power. In the former, or irritative dyspepsia, which is very common among our out-patients, and which is productive of much distress, we have epigastric pain and tenderness; sometimes vomiting; headache; anorexia; a rough tongue, with a greyish fur, red at the tip, and scattered papillæ on either side, with, sometimes, a red streak down the centre. Food causes pain, often both during gastric and duodenal digestion; there are flatulence and confined bowels; and the urine deposits lithates and crystals of uric acid. In the atonic dyspepsia, we often find the tongue tolerably clean, or with a thin pale coating, and marked at the sides with the impression of the teeth; very frequently vomiting after all ingesta; but little, if any, epigastric pain; bowels torpid; and the urine variable, but frequently pale, clear, and of low specific gravity. In severe cases, gastralgia and pyrosis may become prominent symptoms. In both varieties, there exists great mental prostration, amounting often to melancholy.

The irritative variety may generally be attributed to phlogosis, or congestion of the mucous membrane, caused either by cold, improper food, or meals taken too hastily or at too short intervals; all in their turn producing a depraved condition, both in quantity and quality, of the gastric juice.

The second variety referred to is more frequently seen in women or delicate men. All causes producing nervous depression, especially fatigue, mental anxiety, and want, and, above all, tobacco-poisoning, the result of immoderate smoking and snuff-taking, are fruitful causes of this form of dyspepsia. As the cases under this head were none of them depending upon other than functional causes, I do not allude to the dyspeptic symptoms which owe their origin to cerebral or other visceral disturbance, or to malignant disease, ulcer, or blood-poisoning. In the treatment of irritative dyspepsia, a blister to the epigastrium at the onset will often materially shorten the attack. Blue pill with colocynth, followed, if necessary, by a draught of rhubarb and sulphate of magnesia, if the bowels are confined; and, if there be

much gastric irritation, small doses of mercury with chalk, with morphia at bedtime, will be very useful. Alkalies, with the nitrate of potash, may be taken during the day. This, with a diet strictly confined in the first instance to broth and farinaceous articles, will generally effect recovery.

In the atonic variety, the bowels will be best regulated by the compound rhubarb pill, with the addition of one grain of the sulphate of iron; alkalies, with ammonia and chloric ether, will also be proper; and if the vomiting be very troublesome, with a tolerably clean tongue, bismuth in ten-grain doses, with chloric ether, will often act like a charm in giving relief. The bismuth lozenges of the *British Pharmacopœia* will be found very useful in private practice, as an auxiliary to the alkaline treatment.

In reference to tonics, I believe that, as a rule, even the mildest are better avoided during any stage of the treatment of the irritative form of this disease. In the second variety, however, where nerve-tone is so decidedly deficient, a judicious combination of small doses of steel, with ammonia and carbonate of potash, and a few minims (four to five) of the liquor strychniæ (*Brit. Pharm.*), will often be very beneficial.

Of stimulants for dyspeptic use, the best are, unquestionably, dry sherry, diluted with water; claret, in small quantity, and brandy well diluted. Of these, I believe the first to be the best; but claret often agrees exceedingly well, particularly if the patient be of a gouty predisposition.

In the irritative form of dyspepsia, all stimulants of this kind are, I believe, as a rule, better interdicted.

[To be continued.]

EXCISION OF THE SCAPULA BY PROFESSOR MICHAUX OF LOUVAIN.

From Notes by GORDON HARDIE, M.D.,
73rd Regiment.

LOUVAIN lies out of the direct route of Belgian travel, but will repay a visit in many ways. It has still the grave ecclesiastical air of a mediæval university town. Its *hôtel-de-ville* is the gem of municipal Gothic architecture in Europe, as highly finished as a *château*. The University has a very complete Faculty of Medicine, a good hospital, and two excellent clinical professors in surgery and medicine.

The former, Professor Michaux, has an European reputation as a bold and skilful operator, especially in regard to excisions of the upper jaw and the extirpation of naso-pharyngeal polypi through the opening thus made. He has been led to adopt this operative process from his own experience, as well as from that of others, of the liability to relapse, if the polypus, with its various roots and insertions, be not wholly extirpated and freely cauterised with the red-hot iron; as also from the impossibility, in many cases, of removing the tumour through any smaller opening. He, therefore, considers that "Resection of the upper jaw, to make way for the removal of large fibrous naso-pharyngeal polypi, with large and resisting roots and multiple ramifications, should be considered as the general method."

He has now performed this operation seven times, with complete success, and with an experience of many years immunity from relapse in the persons of the first two. The remainder have been operated on within the last four years; but were all known to be well and without relapse in December 1864.

The credit of having been the first to perform this operation for the cure of naso-pharyngeal polypus,

he gives to Professor Syme of Edinburgh, who, in 1832, led the way.

At the time I visited Louvain, Professor Michaux had removed the upper jaw, for these and other causes, twenty-three times successfully, and once with a fatal result.

While there, in December last, I witnessed another formidable operation by Professor Michaux—excision of the scapula, in which also Professor Syme has led the way.

The patient was a lad, of about 15 years old, in whom a large enchondroma (as was supposed) occupied the greater part of the right scapula, extending closely up to the glenoid cavity. It was represented as having originated in the soft parts (?), and as having increased rapidly, the whole duration of the disease being only about six months. At the time the lad entered the hospital, the tumour was closely incorporated with the scapula, and there seemed to be little chance of saving any part of the bone in removing the tumour.

A few days after entering the hospital, the lad underwent the operation. A crucial incision was made over the tumour, and the flaps quickly thrown back. The tumour was then divided to see if it could be detached from the scapula. This incision led to the most formidable hæmorrhage which occurred in the operation. It was arrested by means of plugs of charpie soaked in tincture of perchloride of iron. The last portion of the operation was done with the *écraseur*, dividing the parts in the vicinity of the joint without any further hæmorrhage. The lad bore the operation, which was prolonged from the necessity of administering stimulating enemata after the alarming hæmorrhage, very manfully.

I mentioned Professor Syme's operations to Professor Michaux, and sent him the *brochure* on my return. I have heard since from him that the wound was healing well, and that there was every prospect of the result proving successful. This was three weeks after the operation.

I stayed two hours only in Louvain after the operation, and did not learn what the nature of the tumour ultimately proved to be. I have no doubt that the case on recovery will be fully reported to the Belgian Royal Academy of Medicine.

"WOMAN'S RIGHTS." A novel question has arisen at Oxford respecting the rights of lady governors of the Radcliffe Infirmary. At the October quarterly court, two ladies entered the room and tendered their votes on the election of a committee. This was an unprecedented circumstance, and the Master of University College, who presided on that occasion, would only receive the votes under protest. At the quarterly court last week, five ladies attended, and a long discussion took place, two propositions being submitted—one denying their right of attending, and the other proposing that counsel's opinion be taken on the question. The advocates of the former urged the usage of eighty years, and relied on a phrase in the rules—"ladies subscribing as governors," as implying a distinction between them and the other sex. On the other side it was shown that ladies had the privilege of voting by proxy on certain occasions, and that proxies invariably conferred an additional and not a limited right. This view eventually prevailed, and it was consequently considered unnecessary to obtain a legal opinion. Professor Westwood has, however, since published a letter which, while admitting the right to vote of unmarried ladies, contends that this is a chattel interest, which in the case of married women is vested in their husbands. The dispute will, therefore, probably be revived.

LEEDS GENERAL INFIRMARY.

STATISTICAL TABLES OF THE OPERATIONS PERFORMED FROM JANUARY TO JUNE, 1864, INCLUSIVE.

[Continued from page 59.]

Removal of Malignant Tumours.

No.	Sex and age.	Operator.	Nature of operation.	Stay in Hospital after operation.	Result.	Remarks.
1	M. 54	Mr. Smith	Excision of epithelioma from lower lip, and plastic operation for restoration of lip.	24 days	Recovery, with very slight deformity. The disease has returned in the cicatrix, and is appearing in the submental glands.	The growth and ulceration were extensive, occupying nearly the whole of the lower lip. There were no enlarged glands. The whole was swept away by a semilunar incision; and a lower lip, made by drawing together the remaining lateral portions of lip, released by an incision on either side, extending from the base of the wound outwards through the cheeks to a distance of about an inch and a half. The whole united, and a good lip resulted, by means of which he was quite able to retain the saliva.
2	M. 60	Mr. Nunneley	Excision of epithelioma from lower lip.	7 days	Recovery. Return in glands beneath jaw, which were excised.	A small epithelial growth on the left half of the lower lip.
3	M. 72	Mr. S. Hey	Removal of encephaloid tumour from parotid region.	12 days	Recovery.	An ulcerated growth, the size of a pigeon's egg, sprung from the deep tissues in the left parotid region. It had commenced two years before.
4	F. 31	Mr. P. Teale	Excision of scirrhous from left breast.	21 days	Recovery.	The tumour was the size of a walnut, and occupied the superior part of the breast. No skin was removed, but that immediately covering the disease sloughed.

Plastic Operations.

No.	Sex and age.	Operator.	Nature of operation.	Stay in Hospital after operation.	Result.	Remarks.
1	M. 23	Mr. Teale	Plastic operation for deformity of the nose.	18 days	Considerable relief of deformity.	The deformity had resulted from syphilitic ulceration of the right ala and septum two years before, and consisted of a puckered and shrivelled right ala, a depressed tip, and a widely expanded but flattened left ala. The middle third of the right ala was cut away, and into the gap thus formed a quadrilateral flap, attached by its base superiorly and raised from the cheek, was transplanted and fixed there by wire sutures. The whole flap lived and united, and thus the two sides of the nose were made symmetrical.
2	F. 1	Mr. Teale	Plastic operation for single hare-lip.	10 days	Union complete.	The cleft was on the left of the median line, did not extend through the entire lip, and was confined to that situation.
3	M. 23	Mr. P. Teale	Rhinoplastic operation.	68 days	Recovery, with great relief of deformity.	The nose had been greatly disfigured by syphilitic disease; and, before his admission, attempts at relief had been made on two occasions by plastic operations, consisting of the separation of the remains of the ala from the
nasal bones to form the tip, and the filling of the resulting gap by two large quadrilateral flaps dissected up from the cheeks, and subsequently the formation of a septum from the centre of the upper lip. The result was not satisfactory. The nose was made up of a series of flattened patches, separated by deep cicatricial lines, was broad, short, and flat. The surface of the central portion having been pared away, the usual shaped piece of integument, taken from the forehead and left attached by a broad base at the left inner canthus, was turned down and fastened by sutures in the normal position of the nose. The whole lived and united. Subsequently, the deep lines of cicatrix above mentioned were dissected out, and the edges of the wounds brought into careful apposition, by which means direct union was obtained almost without any marking. When discharged, and when seen some months later, the nose presented a very shapely appearance. See No. 3, Removal of Eyeball.						
4	F. 20m.	Mr. S. Hey	Plastic operation for single hare-lip.	12 days	Union complete.	The cleft extended through the right side of the lip and alveolus, and did not reach the palate. Union by the first intention was perfect.
5	M. 11	Mr. S. Hey	Plastic operations for double hare-lip.	93 days	Recovery, with great relief of deformity.	In this case, the deformity was unusually great; the cleft was wide, and extended through hard and soft palates; and the central portion of the jaw, with attached lip and front incisor teeth, projected horizontally forwards so as to reach an inch beyond the tip of the nose. The operations were performed on three separate occasions. 1. The projecting portion of alveolus with incisor teeth was removed, having been previously detached from the central piece of lip. 2. The middle portion being ignored, the whole cleft was closed, as in ordinary single hare-lip, by bringing together the pared edges of the two lateral pieces of lip. 3. The edges, tip, and under surface of the central piece, were pared, and the remaining portion bent backwards, and so retained by plaster, as to unite with the pared edge of the septum nasi. All the operations succeeded perfectly.
6	M. 11	Mr. S. Hey	Plastic operations for double hare-lip.	93 days	Recovery, with great relief of deformity.	This patient was the twin brother of the above. Their cases were exactly alike, the operations were of a similar kind, and in both cases the results were equally good.
7	M. 7m.	Mr. P. Teale	Plastic operation for single hare-lip.	11 days	Union complete.	The cleft was on the left of the middle line, and extended through the entire palate. The line of union was complete.
8	M. 19	Mr. Nunneley	Plastic operation for strumous protrusion of testis.	29 days	Healing by granulation.	The left testis had been the seat of strumous inflammation for two years, and was exposed and granulating. Soon after his admission into the hospital, two months before the operation, the sore became phagedenic, and spread

rapidly, so as to expose almost the entire gland. After the spreading had been arrested, the wound for a time quickly healed; but when the protruding mass had reached the dimensions of half a hen's egg, cicatrization ceased. The scrotum was dissected up all round the raw surface, and the two edges drawn over the testis, retained in apposition by hare-lip pins. Union did not take place, but the wound afterwards healed with considerable rapidity; and, on his discharge, was healthy, and about the size of half-a-crown.

Operations for the Removal of Cataract.

No.	Sex and age.	Operator.	Nature of operation.	Stay in Hospital after operation.	Result.	Remarks.
1	M. 63	Mr. Smith	Extraction of hard cataract.	23 days	Cured. Could see to read small print.	The left lens had been previously extracted. On this occasion, the right lens was removed. In both eyes a little prolapse of iris took place, but vision in both was very good.
2	F. 66	Mr. P. Teale	Extraction of left hard cataract.	18 days	Cured. Cornea hazy when discharged, but afterwards she was able to read No. 2 Jäger.	The right lens was still healthy enough to enable her to read large print. The left lens was quite opaque. A considerable amount of pain, accompanied by prolapse of iris and some inflammation of cornea, followed; but soon yielded to treatment.
3	F. 68	Mr. P. Teale	Extraction of right hard cataract.	30 days	Cured. When discharged she could not count fingers, owing to slight opacity of cornea, but afterwards improved, so as to be able to read No. 1 Jäger.	Both lenses were opaque. The right cataract only, however, was removed on this occasion. Prolapse of iris and inflamed cornea, attended by considerable suffering, as in last case, followed.
4	M. 42	Mr. S. Hey	Extraction of hard cataract.	29 days	Cured. Prolapse of iris. Clear and large pupil.	The left lens only was opaque. A little conjunctival inflammation followed the operation. Owing to the state of this patient's mind, it was impossible accurately to test vision. That he recovered so much as to enable him to see the people around, was, however, manifest. In the following month, he returned with right cataract, which was removed by extraction, with result similar to that in the left eye.
5	F. 9	Mr. Wheelhouse	Tearing up of capsular cataract.	1 day	Slight improvement of sight.	She had been born with left cataract. The lens had been torn up on several occasions, both at this hospital and elsewhere. Thick opaque capsule only remained. This Mr. Wheelhouse tore up. When seen some weeks afterwards, there was still a considerable amount remaining, but she was able to see large objects.
6	F. 25	Mr. S. Hey	Removal of cataracts by suction.	42 days	Cured. Able to read No. 1 Jäger with right eye, and with left No. 4 Jäger.	The right lens had been opaque four years, and the left two years. The lenses were on separate occasions removed—each at one sitting—by Mr. Pridgin Teale's suction-curette. A portion of the left lens, which was transparent, escaped observation, and was left; in consequence of which, a little inflammation followed. Both pupils were perfect.
7	F. 16	Mr. S. Hey	Removal of cataracts by suction.	55 days	Cured. Excellent vision, which could not, however, be tested, owing to her inability to read.	The cataracts had rapidly appeared during the month previous to her admission, in consequence of diabetes, from which she had been suffering for four months. The cataracts were completely removed—each at one sitting—as in the case last reported. Her recovery was made without any drawback. The length of her stay in the hospital was caused by the treatment necessary for the relief of the diabetes.
8	F. 64	Mr. P. Teale	Extraction of hard cataract.	21 days	Cured. Reads No. 1 Jäger.	The right lens had been previously extracted, with an excellent result.

Partial or Complete Removal of the Eyeball.

No.	Sex and age.	Operator.	Nature of operation.	Stay in Hospital after operation.	Result.	Remarks.
1	M. 30	Mr. Smith	Excision of eyeball.	10 days	Recovery.	A piece of metal had become deeply imbedded in the right eye five months before. Complete loss of vision in that eye, continued severe pain, and subsequent failure of sight in the left eye, resulted. After the right eye had been extirpated, vision was rapidly restored in the left. At the fundus of the right eye was found a piece of steel the size of a threepenny coin.
2	M. 15	Mr. Smith	Abcission of eyeball.	22 days	Recovery.	Vision of the left eye was beginning to fail, in consequence, it was presumed, of irritation caused by the presence of a diseased right globe, which had become the seat of a large staphyloma after a wound when he was four years old. Abcission, as recently brought before the profession at Moorfields Hospital, was performed. A considerable amount of inflammation, attended by constitutional disturbance, followed; but these in a short time were subdued, and an excellent moveable stump resulted. When he left the hospital, the left eye had quite recovered.
3	M. 23	Mr. P. Teale	Excision of eyeball.	See No. 3 of Plastic Operations.	Recovery.	This patient is the same as that reported at No. 3, Plastic Operations (see preceding page). When five years old, he received a blow on his left eye; inflammation and complete loss of sight followed. The injured eye had been subject to occasional attacks of inflammation from slight causes.
4	M. 40	Mr. Nunneley	Excision of eyeball.	5 days	Recovery.	The eye had been ruptured extensively in its anterior surface by a blow. In spite of treatment, suppurative inflammation was threatening, when the globe was removed. All pain and constitutional symptoms ceased at once.

ever afterwards; and for some months prior to his admission into the Leeds Infirmary, the sight of the right eye was beginning to be impaired. In the left eye the iris was universally adherent to a shrivelled chalky lens, and the globe was tender. The right iris was slightly adherent behind. Mr. P. Teale first performed iridectomy on the left eye, and removed the degenerated lens. Suppurative inflammation set in, and excision was, therefore, at once performed. Sight of right eye improved much during his stay in hospital.

Reviews and Notices.

DISEASES OF THE OVARIES, THEIR DIAGNOSIS AND TREATMENT. By T. SPENCER WELLS, F.R.C.S., Surgeon in Ordinary to Her Majesty's Household, etc. Vol. i. Pp. 376. London: 1865.

IN this volume, Mr. WELLS details 114 cases of ovariectomy, the results of his personal experience, in which the operation was completed; one case in which the operation was performed twice; several cases in which the ovariectomy was incomplete; and four cases of fibroid and fibro-cystic tumours of the uterus.

The volume is, if we are not mistaken, the most important addition to the history of ovariectomy which has yet been published; and most assuredly the highest merit must be awarded to Mr. Wells for the perseverance and the determination which he has exhibited in the performance of this operation. We are not saying too much when we state that to Mr. Wells must be mainly ascribed the merit of having given ovariectomy its true place in the domain of surgery—of having made it, in fact, an accepted, a legitimate, and established operation. Let us for a moment consider the position in which the operation stood in professional estimation before Mr. Wells took it in hand.

When LIZARS first performed ovariectomy in Edinburgh in 1825—nearly forty years ago—an angry discussion arose, which has been carried on nearly ever since, as to the “legitimacy” of the operation. LISTON (*Elements of Surgery*, Part iii, p. 54) said that the “perpetrator” of the operation was “indictable for culpable homicide”; and that it was not easy to conceive “how the proposal could have been seriously entertained by any *sane* individual, far less put in practice.” And other high authorities said that it would be very unjustifiable to repeat such hazardous experiments. Mr. Wells reminds us, in the introduction to the work before us, that Mr. LAWRENCE closed the memorable discussion at the Royal Medical and Chirurgical Society in 1850 with the question, whether the attempt to treat diseased ovaries by surgical operation could “be encouraged and continued without danger to the character of the profession.”

For years after this, it is well known that very few surgeons either performed ovariectomy or sanctioned its performance by others; yet Mr. Wells now lays before the profession no fewer than 114 cases in which he has completed this operation, and ten others in which he has commenced but has not completed it. Every case is given in the order of its occurrence, so that the book is to some extent an historical record of the progress of the operation. It is this strict and scrupulous performance of the self-imposed pledge to bring every case—success or failure—before the profession, which, in our opinion, has enabled Mr. Wells to do so much towards making ovariectomy an accepted, established, “legitimate” operation. If those who preceded him had not concealed unsuccessful or uncompleted cases, at any rate they had the discredit of concealment or non-publication; and it was not until the profession at home and abroad became convinced that Mr. Wells concealed nothing, that his example was followed. The

present volume will still further extend the success of that example, for the success obtained fully equals that of any capital operation. The results of 114 cases of ovariectomy were 76 recoveries and 38 deaths—exactly 2 recoveries to 1 death: a result which, considering the otherwise incurable nature of the disease, is a triumph of which Surgery may well be proud.

Possibly the ordinary reader may think the perusal of case after case tedious and unprofitable work: but the real student—the man for the bedside—knows that there is nothing like a case, provided it be honestly told. What would not a would-be lithotomist give for a hundred consecutive cases of stone fairly and honestly recorded just as they happened, whether his patients lived or died, were cured, or half-cured, or relapsed, from Cheselden, or Martineau, or Liston, or Fergusson? How carefully would the aspiring surgeon scrutinise the progressive modifications made by each operator as his experience became wider! How anxiously would he seek for the causes of failure, and endeavour to avoid them! And with what interest would he compare his own results with those of the masters of his art! If Heurteloup, Civiale, Leroy d'Etiolles, or any other pioneer of lithotomy, had only given us a truthful record of a hundred cases of stone treated by crushing, what a mine of wealth the book would be to any one who felt that the stamp of honesty was on it, and that he could implicitly rely on every statement of fact, however he might be disposed to question any conclusion drawn from the facts. Now this is just what Mr. Wells has done for ovariectomy; and we do not know any other book, medical or surgical, in which it has been done so fully before. From his first case in 1857 to his last in November 1864, every case, complete or incomplete, successful or unsuccessful, is laid before his professional brethren, with such details as place all doubt as to accuracy quite beyond question. We believe that this characteristic will be quite as fully appreciated abroad as at home; and that the book will be generally received as a record of hard and honest work, which marks an epoch in the History of Surgery, and is especially creditable to the Surgery of this Metropolis.

CLINICAL SURGERY. ON TUMOURS, AND TUMOURS OF THE BREAST, more particularly in Reference to their Diagnosis. By THOMAS BRYANT, F.R.C.S. Part v. London: 1864.

THIS is another of the valuable practical contributions to clinical surgery, with which Mr. BRYANT has favoured the profession during the last few years.

A CONTRIBUTION TO THE ANATOMY OF THE AMPHIBIAN AND REPTILIAN RETINA. By J. W. HULKE. Reprinted from the *Royal London Ophthalmic Hospital Reports*. London: 1865.

THIS is an account of researches made by Mr. HULKE on the anatomy of the retina in the frog, salamander, snake, gecko, land-tortoise, water-tortoise, and turtle. Those who delight in comparative anatomy will find much interest in consulting it.

WE beg to remind the members of the Association that the annual subscription is now due. Payment of the same can be made either to the Honorary Secretaries of Branches; or to the General Secretary, T. Watkin Williams, Esq., 13, Newhall Street, Birmingham.

British Medical Journal.

SATURDAY, FEBRUARY 4TH, 1865.

THE MEDICAL PROVIDENT SOCIETY.

THE organisation of the Medical Provident Fund—or rather, as it is to be called henceforth, the Medical Provident Society—has been advanced another and an important stage by the adoption of a code of rules by the Directors at their meeting on the 27th ult. These rules were first brought forward at a meeting of the Executive Committee on November 18th; and, having been submitted to each Director a month previously to the recent meeting, were then carefully considered and adopted; and will, with such modifications as may be found necessary by Mr. Tidd Pratt in order to their registration under the Friendly Societies' Act, and with such corrections of the tables as may be advised by Mr. Finlaison, form the laws by which the operations of the Society are to be guided.

Until the corrections suggested by these legal and financial authorities have been made, it is not desirable to publish any details of annual payments, etc.; but the abstract given at p. 123 is sufficiently full to enable the profession to judge of the general bearings of the Society. When the entire scheme, in all its details, is sufficiently matured for publication, we shall take the earliest opportunity of laying it before our readers. In the meantime, we may offer a few remarks on some prominent points referred to in the report.

The Directors have determined, in accordance with the decision of the meeting held on October 20th, that the benefits of the Society shall be open to all duly registered medical practitioners. Regarding the wisdom of this decision, there is, we believe, still some difference of opinion in the Association; certain members considering that, as the provident scheme was originated by the British Medical Association, its benefits ought to be confined to the members of that body; and that the Association ought not to be expected to include in its operation those who do not think fit to enrol themselves in its ranks. The reasons which we once had for expressing no opinion on the merits of the question are removed; and, while we retract nothing of our disapproval of the attempts made to coerce the Directors into admitting the whole profession to the benefits of

the Provident Society, we consider that, in deciding in favour of such admission, they have acted according to the spirit of the Association, and have more-over acted wisely for its interests and for those of the Society.

They have acted according to the spirit of the Association. The Association has for one of its objects "the maintenance of the honour and interests of"—not merely its own members, but of—"the medical profession." If medical men do not think it right to avail themselves of the intrinsic scientific and social advantages of the Association by becoming members, the fault is theirs; but the Association has never yet acted on the principle of refusing to take cognisance of the interests of such men. It has laboured for the good of *the medical profession*. It has, during long years, striven to obtain medical reform; it has endeavoured to procure for the medical officers of the army and navy those improvements in their condition to which they are fairly entitled; it has always been ready to support medical men in the time of unjust persecution; and all this it has done irrespectively of the question whether those for whom its energies have been exerted have or have not been among its members. Surely, then, there can be nothing wrong, or officious, or derogatory, nothing but what is right and proper, in the resolution of the Directors—themselves members of the Association—that the advantages of a laudable and beneficent scheme, first propounded at a meeting of the Association, should be open to all properly qualified members of the profession.

It is highly probable, also, that the course taken by the Directors will be conducive to the interests of the Association. What we said on a former occasion, we would now repeat. "So far as the mere welfare of the Association is concerned, nothing but good can, we think, follow the measure that has been taken. It cannot be expected that any member will leave the Association because it seeks to do good beyond its own limits; and it may be expected that many subscribers to the Fund, by being brought into contact with the Association, and seeing the advantages of it, will join it also." (BRITISH MEDICAL JOURNAL, October 29th, 1864.)

Again, we believe that the extension of the benefits of the Provident Society to the entire profession will be of advantage to the Society itself, by insuring its stability. The greater the number of persons eligible as members of a friendly society, the greater must be the probability of a sufficient number enrolling themselves to place the society on a sure foundation. It may be, and it is to be hoped, that so many members of the British Medical Association alone will join the Provident Society as would suffice for its firm establishment; but still it is judicious, considering how many men there are in the world who do not know their own good, that no restriction

that is not absolutely demanded by prudence should be laid on admission. Moreover, it is possible that the profession outside the Association, seeing the benefits arising from the formation of a Provident Society, would, if excluded, attempt to form a similar institution; a proceeding which could do nothing less than destroy both.

One difficulty existed when it was first proposed to open the Society to the whole profession; viz.: How are those members who are not members of the Association to be represented in the governing body? To overcome this difficulty, the Directors have decided that, while the privilege of electing a Chairman and Vice-Chairman shall be vested in the Association, and while the interests of the members of the Society belonging to the Association are to be entrusted to Directors elected by the Committee of Council and by the Branches, the members of the Society, not of the Association, are to choose Directors for themselves in proportion to their number. This is, we think, the fairest plan that could be devised; by it the interests of all are provided for, and none are excluded from a voice in the appointment of Directors.

Another question which has occupied serious consideration, is the age at which members should cease to subscribe and to receive benefit. It will be remembered that at first it was proposed that all subscriptions and benefits should cease at the age of 60; and that considerable opposition to this proposal was manifested at the Cambridge meeting. The Directors, therefore, to meet the wishes of the profession in a manner consistent with the financial safety of the Society, have determined, on the suggestion of the Chairman, that medical men admitted, under necessary regulations as to health, up to the age of 45, shall have the option of either paying annual premiums which shall entitle them to the benefits of the Society during life, or of making payments which, with the contingent benefits, will cease at the age of 65. The payments, of course, will be higher in the former than in the latter case, on account of the increased risk of sickness in old age. They have further resolved, that members aged from 45 to 60 shall be admitted up to a fixed date, and shall be entitled to receive benefit during the whole of life. What the exact amount of annual premium demanded will be, we cannot at present say; inasmuch as the Secretary is still in negotiation with Mr. Finlaison, the actuary to the National Debt, regarding the formation of a scale which shall be at once sufficient and not oppressive.

The conduct of Mr. Finlaison towards the Society, as detailed in our report, deserves certainly the warmest acknowledgments of the profession. In first applying to him on the subject of revision of the tables, it was fully expected that for the application of his time and of his high professional know-

ledge he would charge a considerable fee—a hundred pounds, report said. And this would have been no more than fair; for Mr. Finlaison is not a man who has his reputation to make as an actuary, but holds a position and enjoys a reputation which might reasonably entitle him to demand a proportionate payment from those consulting him. Nevertheless, he has most generously, and at the same time most delicately, of his own free will, offered to aid the Directors in the revision of the tables, without any expense whatever. Nothing, indeed, could well be more kind and delicate than his letter to the Secretary of the Society. After saying that he will “cheerfully render the Medical Provident Fund all the assistance in his power”, he asks, as a favour, that “he may be permitted to render the Directors this service without any further question of charge”; and adds: “A general respect for the profession, as well as for the laudable object now more particularly held in view, impels me to take this freedom. I trust it will be pardoned.” Surely no pardon was wanted for such a letter. Much rather are the deepest obligations of the profession due to Mr. Finlaison; and we are sure that they will fully endorse the resolution of thanks which the Directors most cordially voted to that gentleman. We are glad to learn that he has readily accepted the office of Consulting Actuary, offered to him by the Directors.

Mr. Finlaison has further manifested his warm interest in the Society, by suggesting the formation of a reserve fund, for the purpose of meeting emergencies “which may arise out of the associated risks of a body of professional men, whose sense of duty and undaunted courage every day leads them to face dangers from which the common run of people reasonably shrink with the utmost dread.” That which Mr. Finlaison here so considerably recommends, is being carried out in the formation of the auxiliary—or, as it has hitherto been inappropriately named, the guarantee—fund. The necessity for the formation of such a fund has been felt; many liberal men in the profession have contributed towards it; and, if any further argument in its favour be required beyond those which have been already adduced, it is to be found in the unsolicited advice offered by Mr. Finlaison. We trust that his words will have weight with our associates and with the profession at large, and that those who have not yet given to the auxiliary fund will give. It already amounts to above six hundred pounds. Why should it not be raised to as many thousands?

We cannot leave the subject of the auxiliary fund, without calling special attention to the very generous offer made by Mr. Carden of Worcester; who, having already contributed thirty guineas—as large a sum as has been subscribed by any donor—has intimated his willingness to give an additional fifty

pounds on the establishment of the Society, provided that ten others will do the same. Surely it will not be long before those other ten liberal-minded men come forward. In any case, Mr. Carden at least gives practical evidence of his desire for the prosperity of the Society.

To draw up a code of rules for the management of such a Society is no light task; and, for men unaccustomed to pursuits of this kind, as are most of the Directors, the labour would have been great indeed, but for the fortunate circumstance that they have among them, and on the Executive Committee, a gentleman thoroughly conversant with the requirements of the Friendly Societies' Act, and possessing moreover much accurate and valuable knowledge. To Mr. Clay of Birmingham is due the merit of having framed a code of rules and tables for the consideration of his colleagues in the Executive Committee; and he most justly, we understand, deserves the acknowledgment of his valuable assistance which was rendered to him by the Directors.

Here, for the present, we must conclude; expressing our renewed confidence in the ability and judgment of the Directors, and urging the claims of the auxiliary fund on our associates and other professional brethren.

A DEFENCE FUND.

WE last week suggested that it was not certain that the establishing of a Defence Fund, to meet the legal expenses of iniquitous prosecutions carried on against medical men, was a thing to be desired. At all events, it seems to us that the matter should be well considered before it is seriously attempted to raise such a fund. We will state what appear to be the difficulties and objections which may be fairly raised against the proposition.

The first objection which meets us is this: that the fact of the existence of such a fund may encourage the bringing of actions against medical men. The very knowledge of the fact will surely not fail to operate on the mind of the low pettifogger who is ordinarily engaged in carrying on business of this nature. It will be to him a positive temptation to foment suits of the kind, to bring actions for pauper clients on speculation; being assured, if haply he may win the day, that his costs will be assured to him. The bait of prospective costs ready for him will encourage him to take the chance of obtaining a verdict—and when is a jury's verdict not in some degree a lottery in such cases?

Then, again, there can, we venture to think, be no doubt that the existence of such a Defence Fund would prejudice the case of the defendant in the eyes of the judge, the jury, and the public. The prosecuting counsel, at all events, would not fail to excite, *ore rotundo*, the indignation of the jury against the

profession for being banded together, as he would tell them, in this Defence Fund, *per fas et nefas*, to carry their medical colleague harmless through the trial. "What chance," he would say, "has my poor client to get justice, when the wealth of the profession is arrayed against him, unless you, gentlemen of the jury, show by your verdict to-day that poverty shall be no bar to the obtaining of justice?" Loud and claptrap Buncombe of this kind will doubtless be brought to operate on the jury to the prejudice of the medical defendant. Counsel, indeed, may say with some show of justice, that the backing of any given case with the Defence Fund would be an actual prejudging of the case—an anticipation of justice, practised by the profession.

Moreover, something may be asked respecting the practicability as well as the policy of establishing a Defence Fund; something, also, as to the satisfactory distribution of it, if established. If we may judge from the important character of the actions which have of late years been brought against medical men, of what they are likely to be in future, it is evident that a fund of this kind, to be worthy of the name, must reckon its pounds by thousands—must be, in truth, a very large fund. Whether it is or is not possible to collect so large a sum for the object inferred, whether it is or is not probable that men can be induced to subscribe for the defence generally of such actions—that, is, without previous knowledge of their individual character—are matters which we will leave to the opinion of our readers. This, however, we may observe, that it is clearly one thing for the profession to come forward and assist a professional brother who has suffered cruel and manifest hardship, but quite another thing to subscribe for the hypothetical case which may at any time hereafter occur. We must not forget, as experience has shown us, that there are cases in which, in the judgment of the profession, a medical defendant may not be altogether free of blame; that he may by his negligence or ignorance have, in a greater or less degree, himself brought down the mischief which has fallen upon his head. We may suggest to our readers that cases of such a kind have occurred within the memory of all of us; and, at all events, cases may occur, and have occurred, in which the opinion of the profession is greatly divided as to the degree of blame which may justly attach to the medical defendant. In such cases, clearly, difference, and fatal difference of opinion, will be expressed as to the distribution of the fund.

A calm consideration of the whole matter seems to us to suggest that in every respect it is best that each case should stand before the profession upon its own special merits or demerits. Where can a better proof of this be given than in Dr. Bowen's case? What can be more honourable to Dr. Bowen, and to the profession amidst whom he dwells, than the manner

in which his friends have rallied round him on this occasion? Can we for a moment doubt that in all like cases the profession will equally come forward and assist a brother in distress? When has it failed to do so? Is not the present result far more satisfactory to Dr. Bowen, and to the profession, and, we may add, to the public at large, than if the legal expenses had been paid out of some regular cut and dried centralised fund? Dr. Bowen has not only had his expenses paid, but the manner in which the thing has been done has been towards him a gratifying expression of professional sympathy. No hesitating or doubtful hand has come forward to assist him. He is sure that he not only receives this proper aid from the profession, but that he also receives its warmest sympathy. Can our readers not imagine that, with a Defence Fund in existence, a defendant might receive the pecuniary aid, but not the sympathy, of the profession? May not cases occur, in short, in which such a fund might, out of mere pity, be perverted from its proper purposes?

These points we throw out for the consideration of our readers; merely adding, that we shall be glad to be convinced by fair arguments that our view is an incorrect one.

In last week's JOURNAL was given a summary, from the *Edinburgh Monthly Journal*, of so-called successful cures of syphilis by syphilisation. We would particularly call attention (in reference to one of these cases) to a letter of Mr. H. Lee. The author of the paper in question will, we fancy, admit, when he sees this letter, that his own experience of the value of syphilisation rests upon a very insecure basis.

THE Report of the Vienna Hospital for the year 1863 has just been published. It contains 271 pages of statistical and nosological data. The number of patients received into the hospital during the year was 23,769, of whom 15,410 were males and 8359 females—the number of patients under treatment during the year being 26,247. Of these, 2846, *i.e.*, 12.7 per cent., died. Syphilis produced the greatest number of patients, 2424; tuberculosis, 1071; gastro-intestinal catarrh, 1424; itch, 1067; diseases of the eye, 1066; injuries, 1274. The average stay in hospital was thirty-two days. The cost of drugs was 20,938 *florins*; food, etc., 253,820 *florins*; fire, lights, and washing, 70,847 *florins*; baths of different kinds figure at about 70,000 in number. The statistics show that syphilis is continually increasing. Amongst operations on the eye are 24 for squint, 103 iridectomies, and 51 for cataract.—The Report of the Lying-in Hospital is just as full and extensive. During the year 1863, the number of women confined was 8826; the number of children born alive

was 4393 males and 4223 females, and born dead was 186 males and 149 females. There were 122 double and 2 triple births; 1.08 per cent. of mothers, and 4.8 per cent. of the children born, died; 607 operations were performed. Of remarkable malformations were observed, anencephalia with spina bifida, absent sternum, three cases of hemicephalia—one of which lived seven days—etc. Of the women, 15 per cent. suffered from puerperal disease, and of these 41.05 per cent. died.—In the Foundling Hospital, during 1863, were received 9408 children, 4734 boys and 4674 girls; 358 had inflammation of the eyes; 1051 died in the hospital (9.82 per cent.), and of these 130 from diarrhoea. Each nurse had to feed two, and sometimes three, children. The total number of foundlings (in and out of the hospital) was 24,777; of whom, 7242 died, and 9 per cent. of them under 1 year of age. The average time during which foundlings are kept is about six years and a half—the normal time being ten years. In the hospital, each child costs per day 63.11 *kreutzers*; in the private houses, each child costs 10.23 *kreutzers*. The total cost of the Foundling is 645,778 *florins*. The cost of a child for ten years is about 308 *florins*.

In the *Australian Medical Journal* is reported the case of a woman who died of hæmorrhage, with retained placenta, after delivery. A doctor, who was sent for, refused to attend her unless his fee were secured to him. The case will remind some of our readers of one like it which occurred some time since at Birkenhead. We refer to it in order to quote the words of the *Melbourne Argus* on the point.

"We have known juries in very similar inquiries censure medical men for neglect; and we should not have been surprised, had it been so in this case. Not that we consider censure in any way merited, but that such seems to be the feeling of the general public. A doctor is knocked up at all hours of the night; and if he do not at once obey the summons, without any inquiry as to whether or not there is a probability of his receiving compensation for his trouble, all sorts of hard epithets are attached to his name. Why is this? Why is it thought that a medical man only, among all professional men, should be ready to give his labour gratuitously in cases of emergency? If a man were to die without making his will, because a lawyer refused to attend his death-bed unless he had some chance of remuneration, we should not hear of the lawyer being heartless, or cruel, or neglectful. If a barrister refused to defend a prisoner unless his fee were guaranteed, he would not find himself spoken of as though he were guilty of some heinous crime against society. Why, then, is the medical man expected to act as though he had not to gain his bread as well as other working men? He generally has to work hard enough for it in any case. The talent and labour requisite to gain a living by medicine are not less, certainly, than other of the 'liberal professions' demand. The current number of the *Australian Medical Journal* speaks of the 'grave misapprehension' which appears to exist 'as to everybody's right to demand the services of a medical man, without even an implied obligation of remuneration.' We are told of several instances

wherein medical men having refused to visit persons to whom they were suddenly called, 'there has been raised a cry of hardheartedness and inhumanity, and members of the profession have been held up to public odium for doing simply what is considered perfectly right in those who practise any other vocation save that of healing.' We imagine there are few persons who cannot tell of their own experience of nobler instances of real charity among medical men than among any other class. Is it, therefore, that they are to be considered public property? Is it considered that a kind of prescriptive right to the services of the whole profession has accrued to the general public, because of the charity shown by many of its members? If so, the other professions have proved themselves wiser in their generation than these. People do not get their wills made, their cases argued, their conveyances drawn, or their houses built, for nothing; and so attorneys, barristers, conveyancers, and architects, pursue their profession for their own benefit, as they have an undoubted right to do, without fear of blame from an injured public. To no men do we go so readily in time of need as to the doctor—of none do we think so little when the time of need has passed."

M. Palasciano has published some further details of interest concerning "animal vaccination". The discovery of Jenner, he says, demanded the inoculation of matter taken from the cow only; and, when the vaccine is passed from one human being to another, it is not surprising that it should, after a certain time, become weaker or lose its power. Troja at Naples was the first person who inoculated the cow from man; and he did this in order to augment the activity of the vaccine, not to increase the supply of it. Troja followed the Bourbons to Palermo, at the beginning of the century; and then Galbiati took up the subject. In 1810, Galbiati published a memoir on *Animal Vaccination*. He there speaks of the diseases which sometimes appeared after vaccination; and maintained that man should be vaccinated from the cow, in order to preserve him from all chances of contracting such diseases. Galbiati was aware that the accidents following animal vaccination in man were more severe than when the matter was taken from a human being; but he showed that it was not more dangerous, and not less prophylactic. King Ferdinand II had his children vaccinated with matter from the cow at the very time when the Government obliged his subjects to be vaccinated with human vaccine. Indeed, in 1810, at the very time when the Committee threatened to proscribe by law animal vaccination, some of its most distinguished members—Cotugno, Villari, and Sementini—actually employed vaccine from the cow in vaccinating their children and relatives.

Out of 272 candidates for the Doctorate of Medicine and Surgery for the year 1863-64 at Berlin, 205 were received. Out of 158 candidates in Pharmacy, 144 were accepted.

THE LATE EDMUND BELFOUR, Esq.

WE have to announce the death of a well known and much respected functionary of one of the medical corporations—Mr. Edmund Belfour, who for upwards of half a century filled the important post of Secretary to the Royal College of Surgeons of England. He died on Monday last, at his residence in Lincoln's-inn Fields, in the 76th year of his age, of asthma, with senile exhaustion and decay. The deceased was highly esteemed, both by the Council of his College and by the numerous members of the profession with whom he had come into contact in the course of his long official career. So highly was he esteemed by the Council, that he was presented by them with the following testimonial, engraved on a massive silver salver:—"Presented by the Council of the Royal College of Surgeons of England, with other plate to the value of two hundred guineas, to Edmund Belfour, Esq., in acknowledgment of his zeal, fidelity, and honourable conduct, and of the invaluable services he has rendered the College, in all its departments, during the fifty years of his tenure of the office of Secretary. (Signed) JOHN FLINT SOUTH, President. November 9, 1860." The deceased has left a widow and two daughters; one of whom is married to Captain E. Ward Fox, of Haddon House, Bakewell, Derbyshire. The remains of Mr. Belfour will be interred this morning (Saturday), in the family vault in Hackney Church.

THE LATE JONES QUAIN, M.D.

WE regret to have to announce the death of Dr. Jones Quain, who died on the 31st ult. His health had been for some time failing.

Dr. Jones Quain was first known as a teacher of anatomy and physiology at the Aldersgate School of Medicine, in its palmy days, when Lawrence was a lecturer there. Thence he removed to University College, where he succeeded Dr. Paterson as Professor of Anatomy and Physiology—a post which he held for seven or eight years. His pupils will never forget his eloquent and charming method of instruction, and his kind and affectionate behaviour towards them. His retirement was regarded as a profound loss to the student and the school. His fine and sensitive nature was not made to brook the roughnesses which so often cross the path of men engaged in public life; and he retired into pursuits more congenial to his nature.

After leaving University College, he passed his days in the life of a scholar, in the cultivation of literary pursuits. We are not aware, however, that, since his retirement, any contribution to literature has appeared from his pen. He is well known to the profession as the author of *Quain's Anatomy*—a work which has, we need not say, won for itself the highest place as a standard work of anatomy. He was the editor, conjointly with Mr. Erasmus Wilson, of *Quain's Anatomical Plates*; and translated also *Martinet's Pathology*.

Association Intelligence.

BRANCH MEETING TO BE HELD.

NAME OF BRANCH.	PLACE OF MEETING.	DATE.
BIRMINGHAM AND MID- LAND COUNTIES. [General.]	Medical Department, Old Library, Birmingham.	Thursday, February 9th, 6 P.M.

MEDICAL PROVIDENT SOCIETY.

The second meeting of the Directors of the Medical Provident Society was held at the Freemasons' Tavern, London, on Friday, January 27th. There were present: Dr. Richardson, in the chair; Dr. Armstrong (Gravesend); E. Bartleet, Esq. (Campton); R. B. Carter, Esq. (Stroud); Dr. Chevallier (Ipswich); J. Clay, Esq. (Birmingham); Dr. Desmond (Liverpool); Dr. Fayer (Henley-in-Arden); Dr. Latham (Cambridge); C. F. J. Lord, Esq. (Hamstead); Dr. Morris (Spalding); T. Heckstall Smith, Esq. (St. Mary Cray); Dr. A. P. Stewart (London); H. Veasey, Esq. (Woburn); S. Wood, Esq. (Shrewsbury); and Dr. Henry, Secretary.

The minutes of the last meeting of the Board of Directors were read and confirmed.

Letters stating their inability to attend the meeting were read from Dr. Bryan (Northampton); Dr. Burrows (London); H. D. Carden, Esq. (Worcester); Dr. Collet (Worthing); Dr. Littleton (Saltash); and Dr. Waters (Chester).

The following is a copy of Mr. Carden's letter:—

“Worcester, January 26th, 1865.

“My dear Sir,—I regret very much to say I find it quite impossible to attend the meeting of the Medical Provident Fund tomorrow. I quite coincide with making the Fund open to the profession generally. I wish the allowance per week could be increased to three instead of two guineas. . . . I hope the preliminary fund will soon be raised to £1000 or more. I will find an additional fifty pounds, if ten others will do the same—contingent, of course, on the fact of the Society being established.

“In haste, believe me yours very truly,
“H. D. CARDEN.

“B. W. Richardson, Esq., M.D.”

Mr. Carden's letter was very warmly received.

Resignations. Letters of resignation, on the ground of being unable to attend to the duties of directorship, were read from Sir Henry Cooper of Hull and Dr. Sieveking of London.

Mr. CARTER moved, Mr. HECKSTALL SMITH seconded, and it was resolved—

“That the Secretary be requested to give notice to the Metropolitan Counties Branch, and to the East York and North Lincoln Branch, requesting them to fill up the vacancies in their representation at the Board of Directors.”

Rules of the Society. The minutes of a meeting of the Executive Committee, held on November 18th, at which a draft code of Rules was prepared for the consideration of the present meeting, were read. The Rules having been printed, and a copy forwarded to each Director a month previously to this meeting, it was agreed that they should be taken as read, and discussed *seriatim*.

Mr. CLAY said that, before the rules were discussed, he wished to have the opinion of the meeting as to whether they should be registered under the Friendly Societies' Act. There were several reasons in favour of their being so registered; for example,

legal power was thereby given to the Society to sue and be sued in courts of law; and the safety of its funds was insured. He moved—

“That the Medical Provident Society be registered under the Friendly Societies' Act.”

Mr. HECKSTALL SMITH seconded the resolution, which was carried unanimously.

Mr. CLAY also moved, Mr. HECKSTALL SMITH seconded, and it was unanimously resolved—

“That the Chairman and Secretary be requested to communicate with the Registrar in reference to the registration of the Society, and to make the necessary alterations in the rules in accordance with the requirements of the Registrar and of the Friendly Societies' Act, provided that these do not interfere with the scheme propounded by the Directors.”

The rules were then discussed *seriatim* by the members present, various additions and amendments being made. As they are to be submitted to Mr. Tidd Pratt in accordance with the foregoing resolution, and further consultation with Mr. Finlaison is required in regard to the tables of payments, an outline only of their principal provisions is here given.

The Society is to be denominated “The Medical Provident Society in connection with the British Medical Association”; and may be ordinarily designated “The Medical Provident Society.” Its object is to enable certain duly registered medical practitioners to provide, by mutual assurance, for those exigencies of sickness or casualty which render them unable to discharge their professional duties. The Society is to consist of honorary and contributing members. Donors of ten guineas and upwards, being duly registered practitioners, and approved by the Board of Directors or Executive Committee, may become honorary members for life; and shall be eligible to office, but shall not have any claim on the sick fund unless they be also contributing members. The Board of Directors may also confer the title of honorary members on benefactors of the Society, but these shall have no part in the management of the Society nor claim on its funds.

Contributing members are to be duly registered medical practitioners residing in the United Kingdom, and approved by the Board of Directors or Executive Committee, enrolled in the books of the Society as contributors to the sick fund for benefit. They must not be in active service or on full pay in the army or navy. They must be healthy; and must not have any organic disease, or predisposition to periodical or recurring attacks of illness, likely to incapacitate them from discharging their professional duties. A candidate for admission as a contributing member is to be required to fill up an examination paper (resembling those of insurance companies) and to obtain a certificate of health from two registered medical practitioners; and also to sign a declaration of the truth of the statements made on the examination paper. These being found satisfactory, he is to be admitted by the Executive Committee, and duly enrolled. Any contributing member obtaining admission by means of false statements is to be expelled, if the fraud be proved by investigation within twelve months from his admission, and will thereon forfeit all interest in the Society.

The annual contributions are to be paid within a fixed time; and any member not doing so will be suspended from receiving benefit; but the suspension may be removed if the arrears are paid within a certain period, and a certificate of health is produced. Members who have been struck off in consequence of not paying their subscriptions may be again admitted on complying with the rules for original admission.

The funds of the Society are to consist of an Auxiliary Fund; a Sick Fund; and a Management Ex-

pense Fund; of each of which a distinct account is to be kept.

The Auxiliary Fund is to consist of all donations and bequests made to the Society, and of the interest which shall be from time to time received from the investments of the same. This fund is to be under the especial direction and control of the Board of Directors, who are empowered to apply it to increase the Sick Fund, whenever this may be necessary. The Sick Fund is to consist of the contributions of contributing members thereto, as defined in the rules and tables; of the admission fees of those contributing members who join the Society before July 1, 1867, and who at the time of enrolment are above forty-five and under sixty years of age (if, on actuarial advice, it be found advisable to demand such fees); and of the interest which shall be from time to time received from the investments of the same. There are to be three classes of contributors to the Sick Fund; viz., members not exceeding 45 years of age, who are to be entitled to receive benefit during the whole of life; members within the same limit of age, whose subscriptions and benefits are to cease at the age of 65; and members aged between 45 and 60, who may be admitted up to July 1867, and from whom probably an admission fee will be required in addition to the annual subscription.

The Management Expense Fund is to be formed by each contributing member paying an annual sum, to be determined by the Board of Directors.

The Sick Fund, or a competent part thereof, is to be from time to time applied, as occasion shall require, for the benefit of such of the contributing members respectively as shall have conformed to the rules of the Society, and who, suffering from sickness or casualty, may be unable to follow their usual professional occupation; but no member is to be entitled to claim benefit in consequence of infirmity. Every contributing member who has been enrolled a member of this Society upwards of twelve months and who has paid his annual contributions, shall be entitled to receive, during the first twenty-six weeks of his illness, two pounds per week; and if his illness continue longer than twenty-six weeks, he shall then be entitled to receive one pound per week.

Regulations are made for the proceeding to be followed when a contributing member is desirous of recovery of sick pay; also for his periodical visitation by a referee of the Society, if he continue a certain length of time in receipt of pay.

The affairs of the Society are to be managed by a Board of Directors, elected in part by the Committee of Council and the Branches of the British Medical Association, and in part by those members who do not belong to the Association. The Chairman and Vice-Chairman are to be elected by the British Medical Association at its annual meeting. The Directors are to hold an annual meeting either in July in each year or at the time and place of the annual meeting of the British Medical Association, and are to meet at such other times as the business of the Society may render necessary. Provision is also made for calling special meetings of the Board. A report is to be presented to the annual meeting of the British Medical Association. The Directors are to elect a Treasurer, Secretary, Trustees, and Auditor; as well as an Executive Committee for carrying on the business of the Society. The special duties of the various officers are defined. Power is given to the Society to appoint agents in such localities as they may think fit; and they are instructed to appoint duly registered practitioners to act as referees in cases demanding inquiry.

Mr. HECKSTALL SMITH proposed, Dr. ARMSTRONG seconded, and it was resolved unanimously—

"That the Rules which have been now adopted be the Rules of the Medical Provident Society, subject to such modifications as may be made by the Chairman and Secretary after consultation with the Registrar of Friendly Societies."

Letter from Mr. Finlaison. The SECRETARY reported that he wrote, on December 9th, to Mr. Finlaison, the Actuary to the National Debt, asking him whether he would consent to revise the Tables of the Society, and also what his fee for doing this would be. In reply, he had received the following letter.

"Old Jewry, City, 15th December, 1864.

"SIR,—Severe domestic affliction has delayed my reply to your letter of the 9th instant. I will most cheerfully render the Medical Provident Fund all the assistance in my power as to their Tables; and with regard to the fee, as the inroad on my time will not be very important, I beg that nothing more may be said on the subject, but that I may be permitted to render the Directors the service you mention without any further question of charge.

"A general respect for the profession, as well as for the laudable object now more particularly held in view, impels me to take this freedom. I trust it will be pardoned.

"I am, sir,

"Yours faithfully,

"ALEXANDER GLEN FINLAISON,

"Actuary to the National Debt.

"Alexander Henry, Esq., M.D."

The SECRETARY also reported that he had on that day received a letter from Mr. Finlaison containing suggestions in reference to the Tables, which would demand further consideration. In the course of his letter, Mr. Finlaison wrote as follows:

"I would be glad, in the interest of the Society, to learn, if possible, that the means could be found of creating some fund in the nature of a reserve, for the purpose of meeting demands which the experience of ordinary provident societies is not accustomed to anticipate, but which may arise out of the associated risks of a body of professional men, whose sense of duty and undaunted courage every day leads them to face dangers from which the common run of people reasonably shrink with the utmost dread."

Dr. CHEVALLIER moved, Mr. CLAY seconded, and it was unanimously resolved—

"That the Board of Directors of the Medical Provident Society desire to express to A. G. Finlaison, Esq., their cordial appreciation of the kind feeling expressed by him towards the medical profession and this Society; and to thank him sincerely for the valuable assistance he has consented to render them in the revision of the Tables of Annual Payments, and for his liberality in offering to perform this labour without expense to the funds of the Society.

"That Mr. Finlaison be elected an Honorary Member of the Society.

"That he be requested to accept the office of Consulting Actuary to the Society.

"That Mr. Finlaison's letter be entered on the minutes."

The CHAIRMAN, in putting the resolution to the vote, said that he could not fail to express, in the name not only of the Directors but of the many other supporters of the Society, the pleasure that was felt in giving such an expression of thanks to the distinguished actuary, Mr. Finlaison. He (the Chairman) had been apprised that a fee of one hundred guineas would have been considered a fair sum for the services of Mr. Finlaison, which had been so kindly offered. This was a great boon; but the way in which the offer was made was the most pleasing part of it. A letter couched in more delicate and generous language was rarely seen. It was a compliment to

the profession altogether, and would be long remembered. [*Hear, hear.*]

Vote of Thanks to Mr. Clay. The SECRETARY called the attention of the Board to the fact, that very valuable assistance had been rendered to the Executive Committee by Mr. Clay, who had kindly drawn up a code of rules for their consideration, and had thereby relieved his colleagues, and especially the Chairman and Secretary, from much trouble and anxiety.

The CHAIRMAN proposed a vote of thanks to Mr. Clay. He said that, but for the industry and the accurate knowledge of Mr. Clay, the Rules that had been drawn up and adopted that day could hardly by this time have been prepared. It was but to express the opinion of the whole Board to move, as a resolution,

"That the sincere thanks of the Board of Directors be given to John Clay, Esq., for the valuable assistance which he afforded the Executive Committee by drawing up a draft code of Rules and Tables for their consideration."

Mr. HECKSTALL SMITH seconded the motion, which was carried unanimously.

Treasurer. Dr. CHEVALLIER moved, Dr. ARMSTRONG seconded, and it was resolved—

"That Dr. Westall be elected Treasurer of the Society."

Executive Committee. On the motion of Dr. CHEVALLIER, seconded by Dr. ARMSTRONG, the Executive Committee was appointed, to consist of the same members as before.

Secretary. Mr. CLAY proposed, Mr. HECKSTALL SMITH seconded, and it was resolved—

"That Dr. Henry be appointed Secretary, and that his salary be at the rate of £100 *per annum.*"

It was also resolved that the Treasurer be empowered to pay the Secretary his salary for the past quarter; and that the sum of Ten Pounds be advanced to him from the auxiliary funds for incidental expenses.

A vote of thanks was given to the Chairman.

The CHAIRMAN, in acknowledging the vote, said he was more than compensated by the success of the Society up to the present time. He had not anticipated so much success; neither was he aware, until the project had ripened into action, that the want of a Medical Provident Society was so keenly felt by the profession. They had but to hold on as they had begun, and one of the most useful and important medical societies of England would soon be in active operation.

The meeting then adjourned, after a continuous sitting of seven hours.

BATH AND BRISTOL BRANCH: ORDINARY MEETING.

The third ordinary meeting of the session of the above Branch was held on Wednesday, January 25th, in the Victoria Rooms, Clifton; R. W. FALCONER, M.D., President, in the chair. There were present forty-two members and visitors.

The minutes of the previous ordinary meeting were read and confirmed.

New Members. The following gentlemen were elected members of the Parent Association and of the Branch: James Douglas Harington, M.B. (Bath); Charles S. Bayliffe, Esq. (Chippenham); Henry Freeman, Esq. (Bath); Charles Vernon Hitchins, Esq. (Weston-super-Mare); G. F. Atchley, M.B. (Bristol); William Cooper, Esq. (Bristol).

The Medical Provident Society. Dr. MARSHALL proposed that the election of a Director of the Medical Provident Fund, in the room of Dr. Budd, who had resigned, be deferred until the annual meeting of the Branch; which was unanimously agreed to.

Union Medical Officers. Dr. COLBORNE (Chippenham) submitted the following petition to the House of Commons on the question of the remuneration of the Poor-law Unions; and proposed that the same be signed by the members of the Bath and Bristol Branch of the British Medical Association, and when so signed be forwarded to Mr. Henry Berkeley, M.P. for Bristol, and Mr. Tite, M.P. for Bath, for presentation to the House of Commons; and that the President (Dr. Falconer) be requested to communicate with the Committee of Council on the subject of the petition.

"To the Honourable the Commons of the United Kingdom of Great Britain and Ireland, in Parliament assembled.

"The humble petition of the Members of the Bath and Branch of the British Medical Association,

"SHEWETH,—That, in the opinion of your petitioners, the present administration of the Poor Laws acts most injuriously towards the members of the medical profession throughout England and Wales, and especially towards such members of the medical profession as are engaged in the attendance upon and care of the sick poor.

"That such members of the medical profession have been compelled to accept salaries or remuneration much below the value of their services, which is a hardship inflicted upon the medical profession.

"That the present administration of the Poor Laws often impedes the members of the medical profession in the proper and conscientious performance of their duties towards the sick poor.

"That it is highly unsatisfactory that there is not any competent medical superintendence of the medical relief to the poor, nor a competent body to assess the true value of the services rendered by the medical profession.

"Your petitioners, therefore, humbly pray your honourable House to cause a searching inquiry to be made into the subject of the medical relief of the poor; and that your petitioners may have the opportunity afforded them of laying their grievances before you; and that they may have such relief as your honourable House sees fit.

"And your petitioners will ever pray, etc."

This proposition was carried unanimously; and the petition received a large number of signatures.

Papers. The following papers were read and discussed.

1. On Excision of the Wrist-Joint. By R. W. Coe, Esq.
2. A Case of Fungus Hematodes of the Eyeball. By F. Mason, Esq.
3. Case of Rupture of the Uterus. By J. G. Swayne, M.D.
4. An instrument for controlling hæmorrhage in operations on the lips (hare-lip, cancer of the lip, etc.) was exhibited by A. Prichard, Esq.

Other papers had to be postponed till the next ordinary meeting.

ROYAL COLLEGE OF SURGEONS. Professor Huxley, F.R.S., will deliver the first lecture of his course, consisting of twenty-four, on the structure and classification of the Mammalia, in continuation of the course of last year, on Monday next, in the theatre of the College of Surgeons.

Reports of Societies.

LIVERPOOL MEDICAL INSTITUTION.

JANUARY 12TH, 1865.

JAMES HAKES, Esq., Vice-President, in the Chair.

Adjourned Discussion on Fever. Dr. GEE commenced by corroborating what had been stated with reference to the form of the fever during the epidemic; the majority of the cases admitted into the Fever Hospital being typhus, but few typhoid; and no case of relapsing fever had come under his notice since the commencement of the epidemic. The mortality of fever cases treated in hospital was undoubtedly very large, being 15 per cent., compared with the 6 per cent. that occurred in those treated at their own homes. This was very difficult to account for, considering that in hospitals were found proper ventilation, good diet and nursing—conditions which we should consider favourable, compared with the filth and wretchedness so often met with in the houses of the poorer classes. Dr. Gee did not agree with Dr. Shearer on the subject of nursing; for he had, generally speaking, found that the patients' friends were the very worst nurses that could be found. Dr. Gee then alluded to the fever patients that were admitted into the Fever Hospital from Mr. Steele's district, where he found that, out of fifty-four admissions from this part of the town, only one death had occurred—a circumstance proving that the fever was of a less fatal form; but why it should be so, he was at a loss to explain. He agreed with Mr. Steele as to contagion being the exciting cause of the disease; sanitary defects strongly predisposing to attacks of the disease. Dr. Gee stated that six years ago there were only two or three patients in the Fever Hospital, whereas at the present time all the wards are fully occupied. Dr. Gee did not think Mr. Steele had grappled successfully with the important question, How do we account for the present epidemic? He thought it owing mainly to the great communication between the various classes that exists at the present day. Yet there was something which he confessed he was at a loss to explain. During the year 1853, when fever was very prevalent in the town, he recommended that certain houses, where fever had been raging, should be entirely closed, and their inhabitants removed elsewhere. Dr. Gee concluded his remarks by an allusion to the "fever-wave" which he thought would in time pass over us, leaving us comparatively free for some years to come.

Dr. E. WHITTLE concurred generally with the remarks that had fallen from Dr. Gee, and more especially when he applied the simile of a wave to the epidemic now in Liverpool. He thought too little importance had been attached to destitution as a cause of the disease. All famines had been followed by epidemics. He had noticed, at the commencement of the present epidemic, the large number of people out of employ; these men, with their small parish allowances, hardly sufficient to keep body and soul together, were the very victims for fever. Dr. Whittle thought too much time was lost in getting fever patients into hospital, and in the meantime the disease allowed to spread from one to another.

Mr. HODGSON mentioned that, amongst one thousand workpeople under his care, there had been numerous cases of fever. Prior to the outbreak of the disease, he had noticed a great declension in the general health of the men, for which he could not

account. Mr. Hodgson was not surprised at the large hospital mortality, for in his own practice he only sent those cases whose chance of recovery was exceedingly small; and if, as he supposed, other medical men did the same, he could not wonder at this large death-rate. Strangers coming from the country, where they had been engaged in agricultural pursuits, and settling down in our filthy courts, soon fell victims to fever, and assisted materially in its spread.

Dr. CAMERON entirely disagreed with the views taken by Mr. Steele and Dr. Gee as to contagion being the only exciting cause of fever. How would the theory held by these gentlemen explain typhus fever not being communicated to other individuals in respectable houses, where there did not exist any sanitary defects? How could it explain a fact that had lately come under his notice, of typhus fever breaking out in an emigrant ship six weeks after it had left the shore? Would this theory explain satisfactorily the presence of fever in the Crimea, where it was found that the disease abounded in proportion to sanitary defects? 9,588 cases were admitted into the Belfast Fever Hospital from 1818 to 1835, of which 7,246 were traceable to contagion, and 2,342 to other causes; and in the Glasgow Fever Hospital, out of 1,061 cases admitted under the care of Dr. Cowan, only 47 per cent. were traceable to contagion. Dr. Cameron argued that it was for those who held the contagion theory to account satisfactorily for these figures; and, with these before him, he could not come to the conclusion that contagion was the sole exciting cause. He drew attention to some admirable remarks on overcrowding by the late Dr. Duncan, who showed that fever raged in large towns proportionate in amount to sanitary defects. With reference to the spontaneous development of the fever-poison, Dr. Cameron remarked that we were unacquainted with the essential nature of it; but, assuming it to be analogous to an organic chemical agent, there was no inconsistency in believing that, under certain circumstances, it might be developed *de novo*. He considered that the experience of the present epidemic had confirmed his opinion as to the error of adopting as a basis of classification the alleged difference in origin of the so-called distinct forms of fever—viz., "typhus," "typhoid," and "relapsing." For the prevalence of fever, an "epidemic influence" was required, which Dr. Cameron took to be a combination of sanitary defects. The army blue-books contained much valuable information on the subject of fever. Dr. Cameron thought fever depended on some atmospheric influence—a supposition that was strengthened when he looked at its geographical distribution. He thought it was not judicious, with our present knowledge, to attempt to trace the spread of the disease to one cause alone, for by so doing we tended rather to impede the progress of scientific investigation.

Dr. TELFORD thought, from observations principally conducted in Dublin, that the spread of typhus was by contagion alone; and he consequently agreed with Mr. Steele and Dr. Gee.

Dr. SPEAKING thought the great mortality of fever hospitals might in some measure be due to a concentration of the poison.

Mr. STEELE, in replying, commenced by stating that he did not wish to underrate destitution, overcrowding, and other sanitary defects, as contributing very materially to the spread of the disease; but he regarded them as predisposing causes alone, and incapable of generating the disease. He considered that the convalescent period was most dangerous, as far as contagion was concerned; and he took occasion to draw the attention of the Select Vestry to this,

hoping they would make practical use of his suggestion. He considered children as exceedingly liable to attacks of typhus, and felt sure that they were frequently the means of conveying the disease from one house to another. Mr. Steele was quite aware of the small percentage of deaths that had occurred in the Fever Hospital amongst the patients admitted from his district, but was quite at a loss how to explain the fact. During the time that Dr. Buchanan was visiting the town, Mr. Steele took an opportunity of showing him that typhus, in some instances of a very malignant form, was, and had been, raging in his district. He agreed with Dr. Sprakeling's remark, when he alluded to the excessive hospital mortality being in some measure due to a concentration of the fever-poison. In his practice, some of the worst cases had recovered by asking the friends of the patient to give them plenty of brandy—a request which was, generally speaking, readily responded to. Mr. Steele regarded many of the points brought forward by Dr. Cameron as tending rather to strengthen the contagion theory which he (Mr. Steele) had been endeavouring to prove. There was so much difficulty attending on proving contagion in every case, that he considered it unreasonable to require that it should be done. He acknowledged that he had met with cases of fever in the most isolated places; but he did not the less believe that the disease was conveyed there. There were so many ways of carrying the disease that would not, perhaps, be perceived.

Mr. STEELE will conclude his paper "On the Nature and Treatment of Continued Fever" at the next ordinary meeting of the Society, on Feb. 9th, 1865.

Correspondence.

MEDICAL ERRORS.

LETTER FROM A. W. BARCLAY, M.D.

SIR,—I am very unwilling to prolong a discussion which, I cannot but feel, degenerates into personalities when your readers are told that I have provided a "convenient loophole" for myself. Dr. Johnson evidently does not comprehend what I have endeavoured to explain in the Lumsian Lectures: that the hypothesis assumed to explain the phenomena is generally, if not always, suggested by some other circumstance than that immediately under consideration. He consequently repudiates the explanation offered in my last letter, in language which I am sure he will, on more mature consideration, acknowledge to be unsuited for scientific discussion.

I do not wish to be drawn into a criticism of Dr. Johnson's volume; but, as he so continually refers to it, I must say that I have failed to discover any logical proof of a single statement which it contains. I would especially commend to the author's notice the expression several times repeated, that a patient was *cured* by so many doses of castor-oil, corresponding as it does exactly to the words "strictly curative", to which he so much objects.

I may be permitted to add, that throughout I conscientiously believed that the occurrence of the "one or two remarkable recoveries" was the circumstance which misled him, just as the occurrence of two very remarkable recoveries after treatment by calomel misled many of us for some time at St. George's Hospital. I cannot, therefore, feel that any "apology" is needed for the sentence which he once more quotes from my volume.

I am, etc.,

A. W. BARCLAY.

LETTER FROM GEORGE JOHNSON, M.D.

SIR,—In my letter published in to-day's JOURNAL there are two misprints, which are rather unfortunate, inasmuch as, both of them occurring in extracts from Dr. Barclay's letter, it may be thought that I have misquoted him. In the sixth line from the commencement of the letter, the word *strictly* should be *directly*; and in the sixth line from the bottom of the same column, *ever* should be *even*.

I am, etc., GEORGE JOHNSON.

11, Savile Row, W., January 28th, 1865.

ARMY MEDICAL SERVICE.

SIR,—Will you allow me to say a few words on two subjects relating to the service? I mean "uniform" and "attendance at mess."

I think it will be allowed that there are advantages resulting from the use of uniform on certain occasions; but there can be no doubt that when on "active service" uniform is absolutely indispensable for every individual holding a recognised position with the army. In the Crimea, even the *Times* Correspondent deemed it advisable to adopt a species of "uniform" by which he might be recognised. Uniform cannot well be improvised for an occasion by any large class of men, therefore it is desirable that there should be a regular established uniform for medical officers, if it be admitted that on *any* occasion it may be necessary that one should be worn. At present there are a variety of "dresses and appointments" prescribed for medical officers, all more or less ugly and objectionable, and considerable expense is entailed by the objectionable habit of removing medical officers from regiments at the caprice of the Director-General. As a remedy for this evil it has been suggested that medical officers should cease to belong to regiments, but should all belong to one staff corps, and wear the same uniform, and be moved about at the discretion of the Director-General. To this arrangement there is one fatal objection: very few indeed would willingly place themselves so entirely in the power of the Director-General. Experience does not justify the belief that such power would be exercised impartially. But the same uniform might well be worn by all medical officers without regard to the branch of the army with which they might be actually serving.

I would wish to recommend that *all* medical officers should wear the same uniform as that now worn by the Inspectors and Deputy-Inspectors-General. There is indeed no valid reason why they alone should wear embroidered belts, and other medical officers be condemned to wear plain, unsightly black belts, similar to those worn by railway guards. It may be said, what is the importance of a belt? I reply, much!—and so will any one who has heard the remarks passed on the dress and appearance of medical officers by "other" officers, and the "unwashed" crowd at a review. Adopt the cap and belts now worn by the Inspectors, and there would be no reasonable cause for complaint.

Secondly, as to "attendance at mess." Undoubtedly the position of a medical officer at mess, according to the prevailing custom and the wishes of the Horse Guards officials, is most unsatisfactory; but if we were removed from attendance at mess, we should suffer much inconvenience individually, for I do not see how a bachelor would be able to live respectably or comfortably without the aid of the mess; and the whole profession would suffer damage, as it would be insinuated by our enemies (and their name is legion) that we had ceased to be members of messes because of "unfitness." No! never let us take such a false

step as that—the withdrawal of the medical officers from the membership of different messes; but rather seek to obtain the position in a mess which is due to the age, knowledge, and relative rank of the medical officer.

I am, etc.,

FORTIS EST VERITAS.

INDIAN MEDICAL SERVICE.

SIR,—I enclose a reprint of the *Englishman's* (one of the leading Indian papers) opinion of Sir Charles Wood's late despatch, from which you will see that I was pretty correct in the estimate I formed of it; the next mail will, I think, bring stronger disapproval when the despatch has been fully understood. A few days more will tell us how far Sir C. Wood has succeeded in deluding the unwary. Do, pray, warn our young friends to avoid the snare.

I am, etc., A RETIRED SURGEON-MAJOR.

February 1865.

"A careful perusal of Sir C. Wood's despatch does not prejudice us in its favour. We readily acknowledge that it confers some benefits; these benefits being the removal of the anomaly in the previous order, by which unemployed and employed officers were remunerated alike, and the consequent acknowledgment of the propriety of granting staff salaries; the granting promotion to assistant-surgeons after a definite period of service; the allowing the twenty-five years of service qualifying for a step of honorary rank on retirement to count from the date of first commission, and to be inclusive of all leave of absence; the limitation of the tenure of office of a deputy inspector-general and an inspector-general to five years, unless re-elected; the making the ranks of inspectors-general and deputy inspectors-general substantive ranks; the bestowal of an additional pension upon inspectors-general and deputy-inspectors-general after five years' active employment in India in those grades, and the annulment of the retrospective operation of Clause III of the Royal Warrant of January 13th, 1860, which required two years' service in, or with, a regiment as a qualification for an assistant-surgeon for promotion to the rank of surgeon,—these are certainly advantages which we feel confident the members of the medical service will fully appreciate. We wish we could write as favourably concerning the remaining clauses of Sir C. Wood's despatch. From paragraph 16 it will appear that the administrative staff of the service is to undergo a reduction, the prizes of the service will thus necessarily be diminished in number, and the chances of earning an augmented pension under paragraph 36 and 37 materially decreased. From paragraph 20, it is to be inferred that many appointments now held by members of the service will, in future, be bestowed upon uncovenanted medical men, and an evident desire is shown on the part of the Home Government to confine Indian army medical officers to the charge of native troops. Paragraph 27 acknowledges the propriety of granting staff salaries for independent responsibilities, but the salaries so granted in paragraph 28, for the charge of native troops, and with reference to which the revised emoluments of all other appointments are to be calculated, we consider utterly inadequate; that we are justified in this opinion will, we think, appear from the comparison of the staff salary, in addition to staff corps pay of his rank, which the order confers upon the medical officer, and that which is granted to other officers of a native regiment of cavalry or infantry.

"The value which the comparison shows that the government place upon the professional usefulness of its medical staff will scarcely tend to diffuse a spirit

of satisfaction and contentment among the officers, now in the service, and to secure for the future a certain supply of medical officers of good social position, liberal education, and professional ability, for her Majesty's service in India."

"Our first impression that, at least in the matter of retiring pensions, the new order would prove a boon, we are sorry to say, further inquiry compels us to correct. We omitted to notice that the pensions now sanctioned are for certain terms of service in India, and that no allowance is made for absence on furlough, as in the pension scale now in force. The comparison of the two scales will show that, except in the case of inspectors-general and deputy inspectors-general, who get an additional pension under paragraph 36 and 3, the alteration is in no respect an improvement." (*Englishman*, Dec. 17th.)

SYPHILISATION.

LETTER FROM HENRY LEE, Esq.

SIR,—In your JOURNAL of this date, under the head of Progress of Medical Science, you furnish an abstract of some cases of supposed very severe constitutional syphilis, which yielded at once to syphilisation.

One of these patients was advised, in 1861, to go to Christiania, and to place himself under the care of Professor Boeck. Six years had elapsed since he contracted a chancre. He was suffering from an ulcer over each tibia and one over the left clavicle. Perforation of the palate had taken place, and some pieces of bone had come away from the interior of the nose; the frontal bone was swelled; and he was very much reduced in strength. He underwent a course of syphilisation, and was "completely cured" in three months.

Now, sir, curiously enough, I have had under my care during the last eighteen months a gentleman who has suffered from disease of the bones of the legs, from enlargement of the left clavicle, and from whose nose some pieces of bone had come away. The frontal and parietal bones in this gentleman were enlarged; he had been sent from Edinburgh to Professor Boeck, and had undergone some 160 inoculations.

It is most unlikely that two cases could agree in so many particulars; and I, therefore, conclude that my patient is the same as the one you mention as having been completely cured.

I took great pains to investigate my patient's case; and, to his surprise, gave him my decided opinion that he had never suffered from syphilis at all. One day, after leaving my house, he met a relative somewhat older than himself; and he mentioned to him, that it appeared a very curious thing that, after going over to Norway to be syphilised, he should now be told that he had not had syphilis at all. His relative replied by asking him if he knew what his father had died of. He did not; and was then informed for the first time that his father had died of "softening of the bones." My patient returned at once to furnish me with this information; which afforded to him, as it did to me, a satisfactory explanation of his symptoms.

The absence of any eruption in this case, and the interval of some years between the appearance of the supposed primary and secondary affections, would of themselves be sufficient to lead to the inference, that the patient's symptoms were not syphilitic; and I can only conclude that, although his journey to Norway had undoubtedly done him much good for a time, he had very unnecessarily undergone some 160 inoculations. One more inference may, I think, be deduced from this case; namely, that the matter em-

played in these inoculations was pus from suppurating or soft sores, and not the secretion from indurated or infecting sores.

Had the latter been employed, my patient would probably have returned from Norway with a disease which he had not when he left England.

I am, etc., HENRY LEE.

Savile Row, January 2th, 1865.

Medical News.

ROYAL COLLEGE OF SURGEONS OF ENGLAND. The following gentlemen, having undergone the necessary examinations for the diploma, were admitted members of the College at a meeting of the Court of Examiners, on January 24th.

Bell, William, Uppingsham
Brady, John, Belfast
Clements, George, Brixham, Devon
Dixon, George, Penrith, Cumberland
Edgelow, Thomas, Teignmouth, Devon
Farrington, Anthony Charles, Ottery St. Mary, Devon
Ferne, James, Kimbolton, Herts
Griffith, Griffith, E. Jeyrn, near Pwllheli, North Wales
Hulme, Samuel James, Bowdon, Cheshire
Hiffe, Charles Webb, Coventry
Logg, Robert Duncan, Calcutta
Lupton, Richard John, Bradford, Yorkshire
Pearson, Henry, Manchester
Powell, Richard Douglas, St. John's Wood
Rogers, George Arthur, Commercial Road
Stokes, George, Hanley, Staffordshire
Sutton, Frederick, County Asylum, Norwich
Taylor, James, Chapel-en-le-Frith
Webb, George Fortescue, Exeter
Webster, Thomas James, Conway, North Wales
Whipp, Robert, Bowdon, Cheshire
Wilson, David, Carmonney, co. Autrim
Wilson, Thomas, Darlington

Admitted on January 25th—

Aroher, Herbert Ray, Montagu Street, Portman Square
Armitage, Frederick William, Louth, Lincolnshire
Bott, Charles Glen, Brentford
Broom, Charles, Llanelly, South Wales
Cox, Pierre Georges, Mauritius
Davies, Evan Parry, Denbigh
Greely, Francis, Galway
Howse, Henry Greenway, Liverpool
Hughes, William Lewis, Llandudno, North Wales
Macaulay, James Campbell, Leicester
Murray, Septimus Henry Liddle, Newcastle
Samuels, Henry George, Liverpool
Stirling, William Boughton, Whitechapel
Walker, Henry George, Great Russell Street
Wallbridge, John Smith, Demerara
Williams, Owen Thomas, Bangor, North Wales
Wood, Miles Asman, Leabury, Hereford
Wykes, Edwin, Birmingham

Admitted on January 26th—

Adrien, Edward William, Old Town, co. Dublin
Anningson, Bushell, Hampstead
Charlton, Alfred, Tunbridge
Cheale, Edward, Tamworth
Child, Edwin, Vernham, Andover
Cotter, Arundel Hill, Cork
Curtis, Charles Edwin, Yately, Hants
Downman, Joseph Rymer, New Zealand
Drummond, Edward, Blyth, Northumberland
Grimes, John, Castle Thorpe, Bucks
Howes, Frank Charles Plumpton, Great Yarmouth
Jacques, John Thomas, Birstall, Leicestershire
Jeffreys, Richard, Chesterfield
Morgan, William John, Burwood Place, Edgware Road
Murray, John, Aberdeen
Orme, Robert, Instow, North Devon
Parkinson, Richard Colville, Guildford
Purcell, Ferdinand Albert, Cork
Shaw, James, Handsworth
Taylor, Arthur, Kennington

Admitted on January 27th—

Armistead, John William, Leeds
Bryan, John Morgan, Northampton
Clayworth, Charles Creasey, Spilsby
Gosselin, William, Cavan, Ireland
Kilroy, Mark Antony, Virginia, co. Cavan
Neate, Charles Pitt Wetherell, Fowey, Cornwall
Redwood, Thomas Hall, Rhymney, Monmouthshire
Shedd, Ebenezer, Montreal

Naval Surgeons. At a meeting of the Court, on January 24th, the following gentlemen passed their examinations for Naval Surgeons.

Bellamy, George, Haslar Hospital, Gosport
MacLaurin, Henry Norman, Greenwich Hospital
Slaughter, Charles Henry, H.M.S. *Royal Adelaide*

APOTHECARIES' HALL. On January 26th, 1865, the following Licentiates were admitted:—

Broom, Charles, City Road
Hedley, John, Newcastle-upon-Tyne
Renton, William Matthew, Shotley Bridge, Durham
Watson, George Henry, Jersey
Wilford, John George Frederick, Drompton, Yorkshire

At the same Court, the following passed the first examination:—

Shedd, Ebenezer, Manchester

APPOINTMENTS.

*WADE, W. F., M.B., M.R.C.P., elected Physician to the Birmingham General Hospital, vice *James Johnstone, M.D., resigned.

ARMY.

BARROW, Staff-Assistant-Surgeon T. S., M.D., to be Assistant-Surgeon 23rd Foot, vice J. Greig, M.B.
DAVENPORT, Assistant-Surgeon C. J., M.D., 6th Dragoon Guards, to be Staff-Assistant-Surgeon, vice T. P. Flynn.
GREIG, Assistant-Surgeon J., M.B., 33rd Foot, to be Assistant-Surgeon Royal Artillery, vice G. D. Milne, M.D.
HANNAN, Staff-Surgeon J., to be Surgeon Royal Artillery.
LANDALE, Staff-Assistant-Surgeon J., M.D., to be Assistant-Surgeon 6th Dragoon Guards, vice C. J. Davenport, M.D.
WOODS, Staff-Surgeon D., to be Surgeon 107th Foot.

ROYAL NAVY.

HILL, George B., Esq., Surgeon, to the *Osborne*.
MURPHY, Alexander, Esq., Assistant-Surgeon, to the *Cumberland*.
WIMBERLEY, C. C., M.D., Assistant-Surgeon (additional), to the *Euryalus*.

VOLUNTEERS. (A.V.=Artillery Volunteers; R.V.=Rifle Volunteers):—

DEANS J., Esq., to be Honorary Assistant-Surgeon 35th Kent R.V.
FISHER, L., M.D., to be Honorary Assistant-Surgeon 29th Lancashire R.V.
SHAW, H., M.D., to be Surgeon 1st Devonshire R.V.
WINTERBOTHAM, L., Esq., to be Honorary Assistant-Surgeon 18th Gloucestershire R.V.
WOOD, H. B., Esq., to be Assistant-Surgeon 5th Administrative Battalion Kent R.V.

DEATHS.

ABBOTT, Charles T., Esq., Surgeon 50th Regiment, at Aldershot, aged 35, on February 2.
*BARTLETT, Jacob Bickford, Esq., at Teignmouth, aged 72, on January 17.
BURROUGHS. On January 28th, at Lee, aged 44, Mary Ann Julia, wife of J. T. R. Burroughs, Esq., Surgeon.
CLARKE, Charles H., M.D., at Stonyhurst, aged 49, on January 14.
FALCONER, Hugh, A.M., M.D., at 21, Park Crescent, Portland Place, on January 31, aged 50.
MERYON. On December 21st, 1864, at North End, Fulham, Eliza, wife of Charles L. Meryon, M.D.
REECE. On January 12th, aged 6, Lydia Florence, youngest child of the late *George Reece, Esq., of 45, Sussex Gardens.
SCHNYLER, Allen P., M.D., at East Budleigh, Devon, on Jan. 10.
SUTTER. On January 10th, at Gravesend, aged 71, Catherine E., wife of Thomas Sutter, M.D., of Southampton.
SLIVER, William, M.D., at Clifton, aged 85, on January 10.
SMYTHE, William D., Esq., Assistant-Surgeon, Royal Artillery, at Calcutta, aged 27, on December 13, 1864.
WRENTMORE, John, Esq., Surgeon, aged 74, on January 18.

PROFESSOR SYME has been appointed one of the Examiners of the College of Veterinary Surgeons of Scotland.

PROFESSOR CHELIUS has resigned the Professorship of Surgery in the University of Heidelberg, which he has held for fifty-two years.

DR. LYONS has resigned his seat for the city of Cork, though earnestly entreated to retain it till the next general election.

IRIDECTOMY IN DUBLIN. In the eighteenth report of St. Mark's Ophthalmic Hospital we note that amongst the list of operations on the eye iridectomy does not occur.

A MEDICAL MAGISTRATE. The Lord Chancellor has recently placed W. H. Ackland, M.D., on the Commission of the Peace for the borough of Bideford, North Devon.

HEALTH OF SCOTLAND. During the month of December 1864, there were registered in the eight principal towns of Scotland the births of 3,139 children, of whom 1,599 were males and 1,540 females. Of these 2,836 were legitimate and 283 illegitimate, indicating a proportion of one illegitimate in every 11.0 births. The proportion of illegitimate births was lowest in Greenock, where it was 4.8 per cent., while in Aberdeen 18.3 per cent. of the births were illegitimate. Eight hundred and eighty-four marriages were registered in the eight towns during the month, being by far the highest number registered in December during the nine previous years. The deaths of 2,411 persons were registered. Allowing for increase of population, the deaths would be the exact average of the corresponding period during the nine preceding years. Forty-four per cent. of the deaths were of children under five years of age. In Aberdeen the proportion was 10 per cent. below this average, and in Dundee the average was exceeded by seven per cent. The zymotic class of diseases proved fatal to 756 persons, or 31 per cent. of the deaths. Typhus fever was the most fatal epidemic; it caused 244 deaths, or 10.1 per cent. of the whole deaths. In Glasgow the proportion of deaths from typhus was 11.7 per cent.; in Paisley, 12.5; and in Greenock, 20.1 per cent. This is the most severe epidemic of typhus fever experienced in Scotland for many years. Scarlatina caused 153 deaths; measles, 102; whooping-cough 89; small-pox 15; diarrhoea and dysentery, 31; diphtheria, 30; croup, 47; metria, 9; erysipelas, 13; apoplexy, 23; paralysis, 52; diseases of the heart, 92; inflammatory affections of the respiratory organs, 402; bronchitis, 276; consumption, 222. Seven of the persons who died (one male and six females) had exceeded the age of 90 years; the two eldest (females) were aged 95 years respectively.

THE LATE DR. BAIKIE, THE AFRICAN EXPLORER. The *Orkney Herald* gives an obituary notice of Dr. Baikie, who was a native of Kirkwall. About the age of 16 Dr. Baikie proceeded to the University of Edinburgh for the purpose of studying medicine, and passed through the regular curriculum. From respect to one of his teachers there he gave the name of Mount Christison to a lofty hill along the reaches of the Binnue. Natural history was one of his favourite studies; and in 1848, at the close of his University curriculum, there was issued from the press *A Catalogue of the Mammalia and Birds observed in the Orkney Islands*, by Messrs. W. B. Baikie and Robert Healdle. It was soon after the publication of this little treatise that Dr. Baikie obtained an appointment in the Royal Navy. Dr. Baikie's first experiences as an African explorer were given to the world in a volume, entitled *Narrative of an Exploring Voyage up the rivers Kwoora and Binnue (commonly known as the Niger and Tsadda)* in 1854. The expedition mainly owed its success to Dr. Baikie's energy and ability. . . . Dr. Baikie visited his friends in Orkney after his first expedition. In 1856 the narrative of his exploration was published, and he seems immediately to have set his whole heart upon returning to Africa. An opportunity soon presented itself. He left Kirkwall in March 1857, and immediately afterwards embarked for Africa. In his second expedition up the Niger, which was destined to extend over the lengthened period of eight years, he was accompanied at first by Lieutenant H. Glover, R.N. Dr. Baikie's aim, in exiling himself for so many years in Central Africa, was to become thoroughly acquainted with the people

and the trading capabilities of the country. For this purpose he established his head-quarters chiefly at Leukoja, on the banks of the Niger, near the confluence of the Tsadda; but he also went occasionally several hundreds of miles inland to Soccata and other places, where he could have no communication from England, and could only himself seize every rare chance of sending letters to this country by caravans crossing the desert of Tripoli. Letters from England, when they reached him, were sometimes a year old.

PRACTICAL DIETARY. Dr. Edward Smith has just published a volume called *Practical Dietary for Families, Schools, and the Labouring Classes*. Dr. Smith urges the distribution among the poor of handbills with the heading, "The Cheapest and Best Kinds of Food;" and he supplies the contents. Amongst his directions are such sentences as the following:—"If you are very poor, spend nearly all your money on bread. Bread and milk porridge make the best breakfast for husband, wife, and children. Buttermilk is a very good and cheap food. Whey is food, and is a much better drink than water or beer. Every member of the family should, if possible, have two pints of new milk, skim milk, or buttermilk, daily. With plenty of bread and milk there will probably be health and strength, and no doctors' bills. When you can buy Indian corn meal you will find it a stronger and cheaper food than flour. Potatoes are the best of all garden vegetables. Tea is a very dear food. If you are very poor, do not buy any tea, but spend your money in bread and skim milk. When you cannot obtain sufficient milk, and must drink tea, let it be weak, and add as much milk as you can to it; but it is then better to make broth for breakfast and dinner. Hot food is both more agreeable and digestible than cold food. Children, old and feeble people, need hot food more than strong adults. When you are very poor, and have not enough to eat, do not drink cold fluids." The teetotallers may like to know that Dr. Smith is convinced that the use of wine is quite unnecessary in the ordinary conditions of health, and that all the elements which give value to wine, except the alcohol, which has been added to it, are found equally in the so-called light wines and the strong wines of Spain and Portugal; and hence ordinary claret is quite as valuable to the system under numerous conditions both of health and disease as port or sherry. With regard to beer he says: "Whilst we cannot deny to beers the position of foods, it may be doubted whether they are necessary ones, and whether others cannot be found which offer the same advantages at a less cost. It is impossible to regard them as economical foods, whilst as medicinal agents they may have much value, and as luxurious foods they may supply a want in the present state of society." (*Daily News*.)

A STUDENTS' ROW AT VIENNA. A misunderstanding has arisen between the professors and students at the University of Vienna. The arbitrary proceedings of the Rector Magnificus (Hyrtl) and his learned coadjutors led to a great academical uprising on the 17th January. Many months ago it was resolved that the 500th anniversary of the establishment of the University should be celebrated on March 12th, that being the day on which the University was founded by Rudolph III, Duke of Austria. As the Austrian Revolution of 1848 began on March 12th and 13th, the government expressed disapproval of the resolution taken by the students, and proposed instead August 8th. The committee elected by the students for the management of the festival publicly protested against the change of day, and then declared that they had ceased to be in office. For this "act of insubordination" the twelve members of the committee

were summoned to appear before the Consistory. On the 17th ult., the offenders made their appearance in the Consistorial Hall, in which sat the Rector Magnificus (the renowned pathologist, Dr. Hyrtl), Messrs. Arnts, Späth, and Miklosich (the Deans of the Faculties of Law, Medicine, and Philosophy), and an academic notary. When the members of the committee entered the hall, so many of their fellow students went in with them that the beadle found it difficult to close the doors. Professor Arnts said that they had "offended against the discipline of the University." While he was speaking the students outside, who were in great force, shouted "Vivat!" "Bravo!" and "Hoch!" so loudly that Professor Späth left the hall in order to request them to be less demonstrative. As soon as the door was opened the students forced their way into the room, which was soon so densely filled that it was not possible to continue the proceedings. It must be supposed that the Rector got nervous, for he promised the intruders that their colleagues should not be subjected to punishment of any kind if they would consent to leave the room. On hearing this the young men retired with loud cries of "Bravo Hyrtl!" The students expressed their resolve not to take a part in the jubilee unless it be held on March 12th. A long conversation then ensued between the professors and their disciples, and it ended by Dr. Hyrtl's promising to see what could be done. When the doors of the hall were opened the Rector Magnificus and the members of the committee were hoisted on to the shoulders of students, and borne in triumph to the University. Dean Späth was loudly cheered by the students, who were about 2,800 in number, but Arnts and Miklosich were greeted with hisses and deafening cries of "Peret! Peret!" The young men then took some refreshment at Dreher's new "beer hall," and then proceeded *in corpore* to Dr. Hyrtl's residence. The professor begged the students to return quietly to their homes, and promised to exert himself to the utmost to bring about a satisfactory solution of the question at issue. Formerly Hyrtl was a highly popular man in the scientific world, but recently he has become an object of suspicion to his colleagues and disciples, because he curries favour with the Ultramontane party. There are about seventy professors at the University, and fifty-eight of them take the same view of what may be called the "anniversary question" as the students. The young men see that the Ultramontanists are straining every nerve in order to increase their influence in Austria, and they are determined to thwart them in their efforts to get the University under their rule. The *Wien Med. Woch.* writes thus of the above affair. The proceedings at the University are not satisfactory. His magnificence Professor Hyrtl is not lucky in his new charge; and he has only himself to thank for it. His famous Rectorial Discourse lost him the sympathies of the scientific world; and his weak temporising proceedings in this students' affair has disgusted his colleagues in the Consistory.

BAD AIR. At the request of the Royal Commission which has recently reported on the condition of the Cornish and other metalliferous mines, Dr. Angus Smith examined the quality of the air which the miners have to breathe, to the impurity of which is chiefly attributable the early break-down in their strength. A healthy atmosphere may be taken to be one with 20.9 per cent. of oxygen, and .04 per cent. of carbonic acid gas. Late in the evening in the pit of London minor theatres as much as 0.252 and 0.330 per cent. of carbonic acid has been found; but the average of above 300 samples of air taken from these mines had 0.785. Two-thirds of the samples presented an atmo-

sphere exceedingly bad, and the worst parts of the mines had only about 18.69 per cent. of oxygen, and as much as 1.8 or more of carbonic acid, in one instance 2.26 per cent. In order to test the effects of such bad air, Dr. Angus Smith caused to be constructed a small close chamber of lead, with windows sufficiently large that they might in any emergency be broken through for a way of escape. The first trial was made by sitting down in the chamber for an hour and forty minutes. This produced about 1 per cent. of carbonic acid, and the air became cheerless. A young lady was anxious to be in the chamber when the air was such that candles would not burn. She was not much struck by the impurity of the air on entering, although the candles were threatening to go out; there was not quite 19 per cent. of oxygen, and there was rather more than two per cent. of carbonic acid. No one had been breathing in the chamber, so that organic matter from the person was absent, and that makes a great difference. She stood five minutes perfectly well, making light of the difficulty, but suddenly became white and could not come out without help. On another occasion a still greater amount of carbonic acid was present in the chamber, but it was not accompanied with a corresponding loss of oxygen, for the gas was driven in upon pure air; there was 20.19 per cent. of oxygen, with 3.84 of carbonic acid. Two persons got headache instantly, and were unable to stay above seven or eight minutes. Dr. Smith stayed about twenty minutes, but felt very anxious to get out, as his movements were made with great haste, and both mind and body betrayed symptoms of feverish activity. The face was flushed, and the lungs acted more rapidly than usual. In fact there was a burning haste to live, as if life were afraid of being put out. It seems to him impossible to endure 4 per cent. of carbonic acid for any length of time. There was a very remarkable lowering of the pulse, and as this happened regularly he puts it down as the result of poisoning with carbonic acid gas, and asks whether it may not suggest a mode of lowering the pulse in fever. These experiments show the great mischief that must arise from the impure, unwholesome air in metalliferous mines. The men call it "thin," "poor," "dead;" the effect is slow poisoning. The explosions of gunpowder produce sulphide of potassium, the effect of which is probably like that of sulphide of hydrogen, but from its acting more slowly there is distributed over a long period that death which might ensue instantly, and so, in chemical phrase, the effect is dissolved in health, and becomes disease. Gun-cotton seems to promise to perform the work of blasting with less injurious influence upon the air. In the coal districts, where, on account of the dangerous gases, great attention has been given to the proper ventilation of the mines, the mortality (accidents excepted) is considerably less than in the metalliferous districts, and this shows that the excessive mortality in the latter is not caused by the mere working underground in dark galleries. Dr. Smith touches incidentally in his report upon various points of practical importance. He notices the purifying effect of rain upon the air, of which there was such a scarcity last year. Moisture with a high temperature is oppressive, but moisture with a lower temperature improves the air, and he holds that cold and moisture in such amounts as those in which they are found in Great Britain are capable of producing powerful constitutions, and that the more watery districts of the kingdom present in many instances the most healthy spots. Still, in relation to ventilation, he notes that "chemical action, and with it the feelings demand a certain amount of warmth first and above all things. No function can go on without it. You may live

hours, days, or years in badly ventilated places with more or less discomfort and danger, but a draught of cold air may kill like a sword. In railway carriages, and in houses also, the great instinct of man is first to be warm enough, and he is quite right. Such a universal instinct must not be sneered at."

OPERATION DAYS AT THE HOSPITALS.

MONDAY.....Metropolitan Free, 2 P.M.—St. Mark's for Fistula and other Diseases of the Rectum, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.

TUESDAY.....Guy's, 1½ P.M.—Westminster, 2 P.M.—Royal London Ophthalmic, 11 A.M.

WEDNESDAY....St. Mary's, 1 P.M.—Middlesex, 1 P.M.—University College, 2 P.M.—London, 2 P.M.—Royal London Ophthalmic, 11 A.M.—St. Bartholomew's, 1.30 P.M.

THURSDAY.....St. George's, 1 P.M.—Central London Ophthalmic, 1 P.M.—Great Northern, 2 P.M.—London Surgical Home, 2 P.M.—Royal Orthopaedic, 2 P.M.—Royal London Ophthalmic, 11 A.M.

FRIDAY.....Westminster Ophthalmic, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.

SATURDAY.....St. Thomas's, 1 P.M.—St. Bartholomew's, 1.30 P.M.—King's College, 1.30 P.M.—Charing Cross, 2 P.M.—Lock, Clinical Demonstration and Operations, 1 P.M.—Royal Free, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.

MEETINGS OF SOCIETIES DURING THE NEXT WEEK.

MONDAY. Royal College of Surgeons of England, 4 P.M. Professor Huxley, "On the Structure and Classification of the Mammalia."—Epidemiological Society, 8 P.M. Dr. Babington, F.R.S., "Suggestions for the Diminution of Venereal Disease among the Civil Population."—Medical Society of London, 8.30 P.M. Dr. E. Sykes Thompson, "Notes on Cases of Tumour in the Mediastinum"; Mr. Tevan, "On Certain Fractures of the Skull."

TUESDAY. Pathological Society of London, 8 P.M.

COMMUNICATIONS have been received from:—Dr. HENRY MARSHALL; Dr. DEBANT; Dr. W. H. O. SANKEY; Dr. B. W. RICHARDSON; Dr. HARDIE; Mr. T. M. STONE; Mr. REGINALD HARRISON; Dr. BARCLAY; Mr. RHODES; THE HON. SECRETARY OF THE EPIDEMIOLOGICAL SOCIETY; Mr. J. JAMES; Dr. GEORGE JOHNSON; THE HONORARY SECRETARIES OF THE OBSTETRICAL SOCIETY; Mr. W. R. HUGHES; Mr. A. RANSOME; Dr. JOHN THOMPSON; Dr. SCHOLFIELD; Dr. W. H. ACKLAND; Mr. PRIDGIN TEALE; Mr. J. H. HAMMOND; Mr. J. N. RADCLIFFE; Dr. FITZPATRICK; Mr. J. SADLER; Mr. RICHARD WILDING; Dr. WILLIAM NEWMAN, THE HON. SECRETARIES OF THE MEDICAL SOCIETY OF LONDON; Mr. W. N. HIRON; and F.R.C.P.

TO CORRESPONDENTS.

* * * All letters and communications for the JOURNAL, to be addressed to the EDITOR, 37, Great Queen St., Lincoln's Inn Fields, W.C. COMMUNICATIONS.—To prevent a not uncommon misconception, we beg to inform our correspondents that, as a rule, all communications which are not returned to their authors, are retained for publication.

CORRESPONDENTS, who wish notice to be taken of their communications, should authenticate them with their names—of course, not necessarily for publication.

NON-MERCURIAL TREATMENT OF SYPHILIS.—SIR: In answer to the inquiries of Dr. Fox, concerning the cases published in the JOURNAL on December 24th, 1864, as to whether they are strictly within the limits of the non-mercurial treatment, I must say that I consider they are. The ointment used in Cases I and II was merely as a local application, not to produce any effect upon the system; the patients used about one ounce a week, and it contained six grains of the nitric oxide of mercury. In Case III, the child had been under treatment before it was brought to me; and instead of improving, it was gradually losing ground; it soon rallied on the non-mercurial treatment. Allow me to add another case, that of J. R., aged 5 weeks (third child). The father informed me that his two previous children had suffered from the same disease. They had been treated with grey powder and blue ointment; both died. Upon examining this infant, I found that it had syphilitic psoriasis on the buttocks and testicles, an ulcer at the anus, and snuffles, and was pale and emaciated. I ordered it, on Oct. 11th, two grains of chlorate of potash three times a day; and on Nov. 1st, it was discharged cured.

I have treated upwards of thirty cases by the non-mercurial treatment with the most favourable results; and will publish them *in extenso* in the JOURNAL, if you wish. I will refer Dr. Fox to a letter of mine, published in the JOURNAL on June 24th, 1864, for three more cases, treated without mercury.

I am, etc.,

R. WILLIAM DOWNS.

13, Surrey Street, W.C., January 25th, 1865.

THE POOR-LAW MEDICAL SERVICE.—SIR: One who has known from childhood what work life really is, hardly needs an apology for speaking out when occasion tempts. As the eldest son of a medical family, whose parent was Poor-law Medical Officer, or, in more intelligible language, the parish doctor, during the thirty-three years he spent in a laborious country practice, I feel I have an Englishman's right to a simple hearing, on the case of Timothy Daly. *Punch* has exhausted my argument on behalf of the Poor-law profession, in to-day's issue. To endorse his views, and encourage the indomitable Richard Griffin—whose effigy ought to adorn the entrance of every workhouse—I send you a copy of a paper I was compelled to print, in self-defence, when assailed by the Leicester Guardians and their clerk some years ago. The facts contained in the paper are indisputable, and, I think, appropriate to the *in memoriam* tablet of Timothy Daly and his aggrieved medical advisers.

I am, etc.,

JOHN A. BOLTON, M.D.

Leicester, January 28th, 1865.

PRYCE V. BOWEN.—SIR: I wish to inform the members of the medical profession that sufficient contributions have been raised to enable Dr. Bowen to defray the legal expenses incurred by the late trial, "Pryce v. Bowen."

I am, etc.,

H. D. SCHOLFIELD, M.D., Treasurer.

11, Hamilton Square, January 31st, 1865.

Further contributions to the "Bowen Fund":—Preston (per Dr. Hammond), £17 15 6; Dr. Waters (Chester), £5 5; Dr. Stevenson (Birkenhead), £5; Mr. Mullock, Chemist (Birkenhead), 10s. 6d.; J. Boutflower, Esq. (Manchester), £1 1.

SIR: I shall feel greatly obliged if you will allow the following additional list of subscribers to the "Bowen Fund" to appear in this week's JOURNAL.

I am, etc.,

J. H. HAMMOND.

Winkley Square, Preston, January 31st, 1865.

James Hall, Esq. (Preston), £1 1; W. H. Spencer, Esq. (Preston), £1 1; E. L. Dixon, Esq. (Preston), £1 1; Dr. Arminson (Preston), 10s. 6d.; Dr. Marshall (Preston), 10s. 6d.; J. Rigby, Esq. (Preston), 10s.; Dr. Gradwell (Lytham), 10s. 6d.

ADVERTISEMENTS.

DR. GRAILY HEWITT ON THE DISEASES OF WOMEN.
Just published, in 1 vol. 8vo, price 16s. cloth.

The Diagnosis and Treatment

of DISEASES of WOMEN, including the Diagnosis of Pregnancy. By GRAILY HEWITT, M.D. Lond., M.R.C.P., Physician to the British Lying-in Hospital; Assistant Physician Accoucher and Lecturer on Midwifery and Diseases of Women and Children at St. Mary's Hospital Medical School.

REMARKABLE for the erudition, judgment, and accuracy with which it deals with the whole subject. *Lancet*.

UNDoubtedly reflects on the Author the highest credit for ability and research, and it must be looked on as one of the most

able contributions of our time to the science of gynaecology.

Glasgow Medical Journal.

A really original work, the study of which will be found almost essential for those engaged in this department of practice. *Deutsche Klinik*.

London: LONGMAN, GREEN, and Co., Paternoster Row.

Clinical Remarks

ON

EXCISION OF THE ELBOW-JOINT FOR THE RESULTS OF INJURY.

Delivered at the Queen's Hospital, Birmingham.

BY

FURNEAUX JORDAN,

SURGEON TO THE HOSPITAL.

GENTLEMEN,—The change which I made twelve months ago in my duties as a teacher of clinical surgery—a change, namely, from an hour's formal clinical lecture to a couple of hours each week (independently, of course, of our systematic visits to the wards), of partly clinical lecture, partly clinical demonstration, partly clinical examination—has, among other advantages, this one: I can bring before you a larger number of surgical topics for practical illustration, and re-introduce, change, or dismiss them at will.

Joint-diseases have always occupied much of our attention, because of their frequency, their importance, and the rapid progress of our knowledge of their surgery in recent years. It is not more than true to say, that this branch of surgery, as exemplified in the writings of Bonnet, Richet, Bryant, Barwell, Sayre, Bauer, and many others, is as much in advance of the state in which Sir B. Brodie placed it, as Sir B. Brodie's views were in advance of those of his predecessors. Nor is this improvement found in pathology only; it is seen in treatment also, especially in the practice of excision of joints, the value of which, particularly in the upper extremity, where mobility is the great requisite, cannot be too highly estimated. I have so often drawn your attention to the several features of the progress of our knowledge of the pathology, diagnosis, and treatment of diseases of the joints, that I need not now advert to them; but pass directly to the consideration of cases which you have recently seen, of excision of the elbow for the results of injury.

As a general rule, the success which follows excision of the elbow and shoulders for injury is extremely satisfactory; not, however, so satisfactory as that which follows the operation for idiopathic or non-traumatic disease. In both classes of operations, the chief mischief arises from delay. I have known several cases of death from too protracted delay in the removal of disease of even the smaller joints of the upper extremity. A great danger of delay in the upper extremity (I need scarcely tell you that the principles which regulate the excision of joints in the upper and lower extremities are totally different) in osseous disease is the fatty degeneration of the muscles which rapidly ensues from the resulting disease of a joint. An useful hint in the practice of excision of the joints may be drawn from modern pathology—a muscular fibril which has once become fatty is never regenerated.

You all remember a case of excision of the shoulder of a young woman who was under my care in

Ward 3. The disease, though not of many months' duration, had constantly progressed, in spite of careful treatment before admission, until the deltoid was little more than a thin sheet of fat and fascia. It is true that when rid of the painful disease, she acquired considerable use in the shoulder, and with the preserved elbow and hand could follow a skilled occupation; but the deltoid could never again lift the humerus. This might have been effected by an earlier operation.

For simple disease, the results of excision are excellent. I will give you Mr. Bryant's opinion on this point. "At Guy's Hospital" (he remarks) "amputation for diseased elbow is so rare that in five years but one case has taken place, and in the same period eight excisions of the elbow have been performed with one death and with one subsequent amputation: in the remainder, a good arm was preserved." (*Diseases and Injuries of Joints*, p. 141.) Our experience at the Queen's Hospital is even more favourable than this.

For the results of an injury, delay is positively disastrous. A severe injury to the elbow-joint may require excision at any time—immediately, or in a few days, or weeks, or months—so rapid and destructive to all tissues is the inflammation which follows. It is the severity of the inflammation and the injury to adjacent structures—muscles, tendons, vessels, and nerves—which place the results of excision in traumatic cases below those of the operation in simple disease. Indeed, in many cases of disease, and in the slighter injuries, appropriate means short of operative interference will often arrest the mischief, and preserve the mobility of the affected joint.

In all diseases of the elbow-joint, whether of traumatic or idiopathic origin (as also in injuries which require immediate operative interference), remember this fundamental rule—however limited the injury or disease, if an operation be required at all, no part of the joint-structure must be removed without removing the ends of all the bones. Such a proceeding is as indefensible as, say, applying the taxis, or operating in strangulated hernia, or attempting to pass a catheter in retention of urine from spasmodic stricture, without securing the inestimable advantages of chloroform. To remove part of a joint, is to induce, with absolute certainty, ankylosis and its consequent inutilty: to remove the whole joint is to secure, in the great majority of cases, a thoroughly useful limb. I remember well, during a lengthened stay in Edinburgh a few years ago, the amusement which was produced in that distinguished surgical school on the publication of a case by a well known surgeon of a large London hospital. The case recorded the removal of the head of the radius only, simply because the head of the radius only was diseased.

The following case illustrates well the advantages of excision of the elbow for disease of traumatic origin. I shall make a few comments as I proceed.

W. C., aged 40. Nearly two years before admission (since which time he has been a complete invalid), a waggon wheel passed over the elbow. The skin was not broken. There was no fracture nor dislocation of the bones. The injury was immediately followed by intense synovitis, which was very speedily succeeded by inflammation of the bone-extremities. The elbow

was flexed at first from synovial distension. [Bonnet, of Lyons, induced the characteristic positions of the several joints in synovitis by forcibly injecting the joint cavities of the subject with water. I have had occasion to show you the value of his experiments, especially in hip-joint disease.] The character of the flexion was subsequently modified by that peculiar muscular contraction which accompanies osteitis, and which is absent in synovitis. Severe intermittent pain was present. Any attempt at movement of the joint was insupportable. For nearly two years the poor man passed from one practitioner to another—all of them being presumably of opinion that an operation was "uncalled for." The last medical practitioner whom he saw, very correctly surmised that surgical interference alone promised any benefit, and desired the man to place himself under my care at the Queen's Hospital. After careful examination, I pointed out to the man not only that excision was the best measure, but that there was really no alternative. I adopted Moreau's method. The patient was removed to bed, a light dressing having been applied and a figure of eight bandage. The arm was at first laid on a pillow, and in a few days when the patient left his bed (the sooner a patient gets up the better), was simply placed in a sling. Every kind of splint was carefully avoided, as splintage greatly favours the tendency to ankylosis. On the tenth day passive motion was commenced, and gradually increased in frequency and extent. After several weeks, by means of strenuous exertions, he succeeded in effecting slight movement without external assistance. In a few months, by devoting himself to seconding our efforts, he acquired every movement in his new elbow as completely as in the elbow of the sound extremity; indeed he could perform all the movements which the military surgeon requires of the recruit—movements, I may tell you, which many men with healthy joints are unable to perform.

The portions of bone which I removed are not altered in shape; and as the cancellous tissue is simply condensed, and the cartilages here and there only very gradually worn down to the bone, they might seem to have little the matter with them to those whose only ideas of bone-disease are those of advanced caries; ideas commonly derived from the "sensation" specimens which abound in museums; specimens which are, for the most part, discreditable memorials of a terribly antiquated surgery, and serve only as surgical scarecrows to warn students of the immeasurable evils of procrastination.

Give me your attention for a few moments to certain inferences which naturally flow from this case. Professor Syme introduced the operation of excision of the elbow into this country; and in all that appertains to this question, he is still our unapproached authority. What does he teach? This: that excision is the one remedy for the vast majority of diseases of the elbow; that ankylosis is itself a sufficient cause for excision (and ankylosis, bear in mind, is the certain result of severe inflammatory disease of the elbow—disease which quite possibly may leave the bones untouched); that every kind of splint should be avoided, as ankylosis is by far the greatest evil to be feared; and, lastly, that passive motion should be commenced at an early period—about the tenth day. The truth of these principles is aptly illustrated in the case I have narrated. The man now follows an occupation which requires mobility and strength, with as great efficiency as before his interregnum of two years.

I have already told you that the results of excision of the elbow for injury are inferior to those of the operation for disease. A careful consideration of the following case will show that the results are far from being so uniformly satisfactory as in the case of W. C.

A man in the neighbourhood of Dudley, received a severe injury to the elbow and arm in a colliery—the soft parts, including the ulnar nerve, being divided down to the bone at the back of the joint. In a short time, to use his own language (I quote these particulars from the report which was taken on his admission into the Queen's Hospital), "the arm was swelled to the size of his thigh." Six weeks afterwards, on his admission into the hospital, the elbow was immovable, and any attempt at movement gave rise to intolerable pain. Marked intermittent pain was also present. A sinus characteristic of bone-disease existed over the olecranon, and permitted a probe to come into contact with denuded bone. In short, there was no room for doubt that the joint was the seat of destructive inflammation implicating the bones; there was equally little room for doubt of the future of the case, unless surgical measures were adopted without delay. What the nature of the interference should be, could not admit of two opinions being held. Excision was the only remedy which gave any prospect whatever of success. The bones when removed gave signs of more advanced disease than was present in the case I have already brought before you, and could not possibly escape detection in any competent and careful examination. The bone-extremities were slightly enlarged, but not altered in shape. The sawn surfaces of the radius and ulna showed condensation of the cancellous tissue. In the olecranon process the osteitis had passed beyond the stage of sclerosis; the once cancellous tissue could be scooped out with the finger-nail and rubbed into a putty-like pulp. The cartilages, as in the case of W. C., were here and there gradually thinned down to the bone. The synovial membrane was completely destroyed. The man's habit of body was flabby, and his mental idiosyncrasy so strange, that in the after-treatment he not only did (as my dressers frequently remarked) the very reverse to what he was told to do, but undid what others had done for him. Add to these circumstances the severe injury to the adjacent structures at the time of the accident, and you will not be surprised to learn that the fibrous union was weak, and subsequently somewhat elongated; and that the muscular power over the elbow has not yet been regained. Much, however, may frequently be done in these cases by means of time, and (a suggestion of Mr. Barwell) by forcible friction of the bone-extremities, subcutaneous puncture of the uniting medium, and other measures.

I have frequently drawn your attention to the pathology of bone-disease; and there is no part of it more important than the changes which occur in the several stages of osteitis; and these have been greatly elucidated of late years by continental observers. Before I conclude these remarks, let me urge upon you the importance of an energetic and life-long study of pathology generally. I mean an attention so profound, that you will apply at first-hand to the writings of the numerous honest workers who are now revolutionising this most important branch of our knowledge; but whose views have not yet permeated the general current of surgical literature and teaching. Never forget that diagnosis is neither more nor less than the recognition of pathological states. As all treatment is founded on some

kind of pathology, the truer the pathology the more successful the treatment will be.

I might give you many illustrations of the everyday practical value of even advanced pathology. I will give you one or two. Those who have worked most closely at this subject in this country, and especially in Germany, have shown indisputably that phlebitis (in its common acceptation) has no existence; and yet surgeons are still too frequently afraid of putting ligatures on veins—structures which inflame with more difficulty than any others in the body. Another evil, a corollary to this, is of still greater magnitude. The numerous and too frequently fatal results of thrombosis and embolism, if unrecognised, are of course also unchecked, or are aggravated if treated as so-called phlebitis. Pyæmia, again, has quite recently been resolved into several distinct diseases; and, therefore, the treatment of the one supposed disease (which really never had any existence) should surely be relinquished. Take, again, the question of repair. It is still taught widely that there are many modes of the repair of wounds—immediate union; union by the first, by the second, by the third intentions; subcutaneous repair; repair of fractures. There is really but one simple method of repair in all localities, in all tissues, and in all circumstances. The sooner the views of Reichert, Donders, Virchow, and Kölliker (a late and reluctant convert to the new school), on the development of the tissues, are carried into the domain of surgical pathology, the sooner will the treatment of wounds be placed on a single, uniform, and philosophic basis.

At our next week's clinical meeting, I shall call your attention to a case of large strangulated inguinal hernia, who came in, a few days ago, with intense collapse (partial consciousness, pulse 48), hicough, and constant vomiting. I performed the single form of the extraperitoneal operation which I have devised (*Medical Times and Gazette*, 1864) for relieving the stricture by a small incision in the cutaneous structure away from the tumour, as in Mr. Gay's operation (large enough to admit the finger only), and leaving in all cases a hernial tunic unwounded between the subperitoneal fat and the knife. The peritoneum, subperitoneal fat, and fascia transversalis, in inguinal, umbilical, and ventral herniæ, are left undivided; and the peritoneum, subperitoneal fat, and femoral sheath, in femoral hernia. In two hours, the pulse rose from 48 to 72; and he has remained well, chiefly because the almost subcutaneous wound was not in itself dangerous. The wound in itself, in the operation of opening the sac, is extremely dangerous. I shall also bring overwhelming evidence to show the enormous saving of life which follows the extraperitoneal (pre-taxoid) operation, as contrasted with the rude, unanatomical, unnecessary (save in rare, exceptional, and recognised cases), and dangerous operation of opening the sac.

A COMMISSION is engaged in collecting subscriptions for the erection of a statue to Dupuytren, as well as of Laennec.

MEDICAL MAYORS. Mr. Garrington, a medical man of high standing in Portsmouth, is candidate for the office of Mayor of Portsmouth, vacant through the death of Mr. Cooper, who was also a medical man. Mr. Garrington has two lawyers for his opponents.

Remarks

ON

DR. BARCLAY ON MEDICAL ERRORS.

BY

THOMAS MAYO, F.R.C.P., F.R.S.

I WILL venture to suggest some remarks to Dr. Barclay, the subject of which, I am sure, has not escaped his attention in his work on *Medical Errors*, though I do not think he has given it quite sufficient weight.

Dr. Barclay affirms, that "few have attempted to apply the rules of inductive reasoning to medicine, though many of the collateral branches of knowledge which are embraced in the education of medical men, are cited by logical writers as instances of progress made in consequence of the employment of the methods of research which this department of philosophy has suggested." Dr. Barclay afterwards says, that he thinks he shall be able to show that the principles of medicine are based upon true and legitimate inductions. Now, the process of induction by the method of agreement, as applied to the simpler uniformities of cause and effect, *has been* cultivated with various skill by many medical writers; and Dr. Barclay adduces good examples of it from Dr. Jenner and Dr. Baly, not using, indeed, the expression for it which I borrow from Mr. Stewart Mill. But when Dr. Barclay proposes to show that the principles of medicine are largely based upon *true and legitimate induction*, by which I presume him to mean the method of difference of Mr. Stewart Mill, or its equivalent, *per exclusiones et rejectiones debitas*, of Bacon, I beg leave to observe that this latter induction has been abstained from, whether consciously or unconsciously, by medical writers, *because it is inappropriate*. We cannot isolate, and exclude, and subject to experiment the elements of disease, so as to arrive at that class of conclusions which are arrived at in science; *e.g.* in the science of chemistry. Meanwhile, the induction by the method of agreement, inferior as it is to the more exhaustive process which constitutes true and legitimate induction, has been able to give us a high amount of certainty, as in those instances quoted by Dr. Barclay. But if medical writers venture to affirm more logical certainty in inductions than their subject matter allows, in place of progress in pathology and therapeutics, a reactive state of medical opinion will take its turn. We shall fall into a distrust of reasoning from having overrated it, and cease to antagonise disease for fear of antagonising it too much; a state of thought to which the conclusions of Sir John Forbes manifestly point.

I do not consider these cautions as vain. The early history of medicine is full of gratuitous assumptions, taking the form of *a priori* principles, and leading to proportionate error. Dr. Barclay will benefit medical reasoners, not by directing them to aim at inductions analogous to those of pure science, but by preserving them from such as he has commented on in Dr. Todd's practice.

One form of gratuitous assumption, I think, Dr. Barclay will allow me to suggest, as an important

though minor element of inductive thought. "It may be called" (I am quoting from my own outlines of medical proof) "the extemporaneous hypothesis, applicable, as it is, when a case falls under no recognised law, and the mind craves, in the absence of such law, some intelligible ground of immediate practice. It is the faculty of thus extemporising, which perhaps, more than any other, distinguishes an able physician, provided it be combined with a just appreciation of the value of such hypothesis, and a readiness to abandon it in the presence of contravening facts. A capacity and readiness in executing this process is, indeed, sometimes a source of reproach to us, as practising a merely conjectural art, by those who are unable to distinguish the results of luck from those of sagacity; and sometimes physicians, with a false modesty, humour the imputation. Although in its immediate application conjectural, the power which I speak of demands an original talent, and is never successfully carried into practice, except by men of large acquired knowledge."

Original Communications.

ILLUSTRATIONS OF THE DIFFERENT FORMS OF INSANITY.

By W. H. O. SANKEY, M.D. Lond., Proprietor of Sandlywell Park Private Asylum; Lecturer on Mental Disease in University College, London; late Medical Superintendent of the Female Department, Hanwell Asylum.

[Continued from page 62.]

In the last paper, certain so-called varieties of insanity were arranged under three classes: viz., 1, Varieties named after some particular symptom; 2, Certain cases named from a supposed cause; 3, Others formed out of the progress of the disease. The present article will be confined to a few remarks upon some of these cases.

1. The varieties named after a particular symptom—as Kleptomania, Oinomania, Nymphomania, etc.—are chiefly recent cases; and the prominent symptom from which the case is called, is not the sole or single deviation of the mental faculties, but is perhaps the most obvious or predominating only. There are other cases, in which a fixed delusion lasts for years; and on such the popular belief, that a person can be mad on one point only, is probably founded. The class of which we are now speaking are usually free from true delusion, which only occurs at a late stage of mental disease. The symptoms in question are more an alteration of the moral faculties, or the appetite, desire, etc., and are, therefore, connected with the disease in an earlier stage; but there is nothing whatever to separate these cases from melancholia and mania generally, to one of which forms the cases usually belong.

The state called Kleptomania is merely a symptom; and it is one very commonly met with in the first stage of general paresis.

With respect to Nymphomania, it occurs in connection with melancholia and recurrent mania more frequently than in acute mania.

Oinomania, or Dipsomania, presents itself in two forms: 1, Simply as a vice, the result of an unbridled appetite; 2, As a true symptom of disordered mind;

and the cases are usually recurrent mania. A person, otherwise respectable, without obvious cause, suddenly breaks out into an uncontrollable desire for drink. The attack, in its suddenness, resembles closely the outbreak of homicidal insanity; and neither case, I am disposed to believe, occurs as a primary form of disease; and when dipsomania happens as the result of mental disease, it obeys all the rules of an attack of recurrent mania. The patient is often a temperate person in the interval between the attacks.

Of Puerperal and Phthisical Mania, I have had numerous examples under my care; and some have already been given as illustrations of mania and melancholia in these papers. I know of nothing that distinguishes cases attributed to these causes from disease arising from other causes. It has been asserted, that the phthisical patient is much more excitable; but this is by no means true of all. Dr. Clouston, who has studied these cases with the greatest attention, thinks that, in about one-fourth of the whole, the symptoms are of a peculiar and fixed type. The line of demarcation is not, however, very clearly made out by him even; and the peculiarity of the symptoms appears rather to be due to debility. The patients are, perhaps, a little more peevish and suspicious. It may be called, says Dr. Clouston, a mixture of acute mania and dementia.

With respect to suicidal mania or suicidal melancholy, I have already described several cases. Another remarkable instance of this condition, and its connection at times with an hereditary predisposition, may be here cited.

A governess of good ability was admitted into the Hanwell Asylum affected with melancholia. Her mother was insane, and died so. She was eighteen months out of her mind, and was depressed the whole time, and appears to have died by exhaustion. One brother, at the age of 28, committed suicide. He had been low spirited for six weeks previously. His death was believed at the time to have been accidental. He took medicine, and had to go to the water-closet during the night; and he was found dead on the following morning, with his head in a tub half-filled with water and empty ginger-beer bottles. A second brother, at the age of 18, destroyed himself on account of a love affair. A third brother was found drowned; but it was suspected that he had been foully dealt with. Her mother's brother shot himself. All the above were relations on the female side. On the male side, her father's brother shot himself. None of the above were given to drink. There was never any intermarrying, that could be traced, in the family.

The patient was a governess, and a very accomplished person. Her case was melancholy, with restless agitation. She was removed from Hanwell to another asylum; but there were no symptoms which would distinguish her case from others arising from different causes.

With respect to those cases on which distinct names have been bestowed, but which, according to my views, are simply stages of one disease—as imbecility, dementia, etc.—there is one form which requires a few words, and which has received the title of "Folie Circulaire", or "Folie à Double Forme", from the French authors, by whom it has been particularly described. In most French systematic treatises on insanity, it occupies a distinct position. In well marked, or typical, instances of this form, there is a stage of melancholy, in some cases followed by a lucid interval, and then a stage of excitement or mania. In some cases, the lucid interval is absent—at least, such is the account given by authors. To

M. Falret is due the first emphatic account of *jolie circulaire*; but Willis, in 1680, speaking of mania and melancholia, says, "Hi affectus sæpe vices commutent, et alteruter in alterutrum transeat." I cannot view these cases as belonging to, or constituting, a separate form of disease. The fact is, that in chronic insanity very frequent alternations of the patient's state occurs, and every variety of alternation is found. Sometimes the patient is restless one week and dull at another period; or the same takes place on alternate days, or months; or one may go even several months, and then have a period of decided maniacal excitement; indeed, among a number of chronic lunatics, such is the rule rather than the exception. Very few chronic lunatics, before they sink into absolute imbecility, are free from occasional outbreaks of excitement; and many have periods of depression, also; and, on the other hand, many who have sunk into absolute dementia are also at times excited and violent. Out of the large number of chronic patients, an infinite variety in the modes of alternations must be found; and, in a small proportion, this somewhat regular interchange of lowness and excitement occurs. The condition is always allied to a state of imbecility, and, like all disease in a chronic state, is very incurable.

With respect to the states of imbecility and dementia, all degrees of mental debility are to be met with. On the subsidence of the acute stage, some patients, of course, regain perfect sanity of mind; in others, on the subsidence of the morbid process, a permanent mental defect remains. The patient recovers, like one from a fractured leg, with a permanent limp or halt. It is to certain cases of this description, that English writers apply the term monomania. The French, however, use that term for chronic insanity, or chronic mania. A condition of monomania, or of a mental defect on one point, as the term is used in England, is an absurdity, if the definition is to be applied with scientific strictness. Every mental operation is more or less complex; indeed, the simplest proposition involves many mental faculties. For example, when a patient believes himself to be king, how many mental actions are brought into play, as judgment, reason, memory, etc.?

Many states of mind, however, are met with on the subsidence of active disease. There is this peculiarity about them, which marks their chronic character—they are connected with the intellect proper. They are errors chiefly of judgment, reason, association of ideas, etc.; and involve to a much less degree or more indirectly the moral attributes of mind. The condition is a stage of chronic disease; it may be permanent or nearly so, or transitional to a greater degree of mental debility; and whether we call the state monomania, or chronic mania, or chronic insanity, it is still but a stage of one original or primary disease, which may have occurred with predominating maniacal or melancholic symptoms.

When a persistent false belief—that is, a delusion—is found, the case in which it occurs is chronic and of long standing. A delusion, an alteration of the intellect, does not occur in the first stage of the disease. At least, such is my experience. I have received patients who have had a particular and predominating delusion, whose cases have been certified to be perfectly recent, and the symptoms to be primary; but which have all proved to be otherwise on a more careful investigation.

Many of these cases appear to be stationary; certainly many continue in one state for years; yet, in all, there is a gradual declining of the mental power. In some, the progress is rapid and evident; in others, slower and almost imperceptible. In by far the

larger portion, a state of imbecility and dementia gradually becomes established.

When the disease has advanced to this stage, recovery is of course hopeless. However, as the mind becomes more and more feeble, the patient may be, by careful attention, re-instructed in many matters, and habits lost in the acute stage of disease can be restored. Very many, even of the worst cases—even those who have lost all ideas of propriety or decency of behaviour—have been rendered orderly, quiet, and cleanly, by good nursing. Indeed, taking the class as a whole, perhaps there is none for which amelioration of the condition can be so safely promised as for the imbecile and demented.

To the Commissioners in Lunacy, and to Mr. Gaskell especially, is due the attention which the specialty have lately given to this branch of treatment. At Hanwell, the number of wet and dirty patients was reduced from 10 per cent. to 2 per cent. by careful attention day and night; and with the cure of wet and dirty habits, there was a corresponding improvement in habits of propriety and decency, as well as in health and comfort. By the word cure is meant that the habit was eradicated. Many patients who required to be roused twice or even three times during the night at first, afterwards required attention once only, and at length no attention at all, and were restored to the wards appropriated for the cleanly or orderly classes.

[To be continued.]

A CASE OF CHOREA.

By JOHN THOMPSON, M.D., F.R.C.S., Bideford.

THE article in a late number of the JOURNAL by Dr. J. Turnbull, on chorea, has brought forward a subject, on which much has been written, and yet no very precise information rendered respecting the pathology or the treatment of the disease, on both which our knowledge is painfully defective.

A well written description, such as the one referred to, embraces the general characters of the disease, and points out graphically striking facts; as that rheumatism and chorea have sometimes a clear relationship; also that chorea and hysteria sometimes approximate closely. But, nevertheless, a number of phenomena are still undescribed, which yet appear to belong to chorea in some one of its forms, as I think the following case will show.

I was consulted in February 1864 for a well grown intelligent girl of fourteen, under the following circumstances. She had menstruated regularly for some time, but the quantity was in excess; and she was weak, apparently from this cause. There was pain in the right elbow-joint, which contained a little effusion; and this condition impaired the mobility. In other respects, there seemed not much the matter. The joint-affection was believed to be rheumatic; and this was confirmed by a speedy accession of the same character of pain about the intercostals of the left side. The stomach became very irritable; food was seldom retained; the bowels were rather constipated; menstruation ceased. The spine was sensitive along the whole line of the spinous processes; and some disposition to twitching was occasionally manifested about the neck and extremities. There came on a peculiar convulsive voice-sound, somewhat resembling hicough, repeated with almost the rapidity of time-seconds, and accompanied with an agitation of the neck much resembling paralysis agitans. All these had been developed by the beginning of April. At that time Dr. Brown, of this place, met me in consultation; her case being then, in brief, as follows.

Vomiting almost always follows any taking of food. The bowels are rather constipated. There is a constant tremulous movement of the head and neck, and the peculiar laryngeal sound before described. The limbs are rather tremulous on being used; and there appears to be anchylosis of the diseased elbow-joint. She cannot stand, nor sit up without being supported. The agitation of her system and the voice-sound entirely subside on her taking sleep.

I had already given her steel, effervescing salines, iodide of potassium, calumba, opium, etc.; some of these being directed to the improvement of the tone of the system, others to the relief of the vomiting. Some counterirritation was employed over the spine, to the side, and to the elbow; and every attention given to the diet, ventilation of the room, and nursing.

During another month, we tried the preparations of zinc, the mineral acids, strychnia, cod-liver oil, occasional doses of purging medicine, with a little blue pill; and supported her strength in every possible way. Counterirritation was still applied to the spine.

The case did not at all seem benefited by our assiduity; and we now recommended her to be taken to a house in the country, in a commanding situation, and enjoying a strong breeze from the Atlantic. When she left, she still had the agitation of the voluntary muscles, and the spasmodic action of the larynx; and both these were notably increased if she were hurried by the intrusion of a stranger, or by any undue notice of her ailment. After being in the country for some weeks, the agitation of the neck (which was continuous when she left), as also the voice-sound, ceased; but the irritability of the stomach was in no way abated.

It was now determined to omit the medicines, and see what would be the effect of trusting to the influence of the country air; counterirritation by means of mustard being still advised as an occasional application. The omission of the medicine was attended with no improvement in the symptoms, the vomiting being even worse than before, and the patient could not be induced to take any food. I endeavoured to support her system by means of injections of good broth or milk, and these were continued for some weeks. During this period, vomiting sometimes occurred; and blood was occasionally ejected in some quantity.

At length the patient objected so strongly to the use of the injections, that they were first omitted occasionally, and at length discontinued, in spite of my advice to the contrary. I warned the friends that, without food, it was impossible that life could long be sustained; but to no purpose. The patient was inflexible, and they would not consent that force should be employed. But, notwithstanding the abstinence from food and drink, the patient lived on. An injection of water was twice used to unload the bowels; but no other interference with nature took place.

A most complete abandonment of the case was made; for I believed that the craving from hunger would compel the patient in no long time to eat; but in this I have been entirely disappointed, for she has now been over six months without having taken a morsel of food or moistened her mouth with fluid, so far as is known. She has had no injection for several months; the bowels do not act, nor is any water passed. Her condition resembles that of hybernation; rolled up in a little bed in the corner of a room, she takes no notice of any one, and only answers in a low whisper any question that is put to her.

Her pulse is now about 120 in the minute, and the respirations about 16. The breathing during the ill-

ness has been generally slow, and the pulse much less frequent than at present.

At times she has been in a state of great excitement; has had croupy breathing; and a disposition to hysterical convulsion, throwing about her hands, and endeavouring to pluck out her hair. It has been necessary for her attendant to restrain her for an hour or two at a time, when this has occurred. For the last few months, nature has seemed too much exhausted to allow such exertion.

It is now over ten months, since this patient came under my attention. She took very little food for the first four months, and is believed to have taken none for the last six. The residence in the country, which extended over four months, benefited her, in that all the paralytic agitation and spasms were removed; but no improvement took place in any other respect. The last time an evacuation was procured, the matter was scybalous, and strung bead-like; the last evacuations of urine resembled the thick ammoniacal fluid, which constitutes the urine in birds.

She is greatly emaciated; her spine being particularly distinct, and every bone in it defined. There is tenderness over the spines; but no paralysis in any part of the body. The surface of her skin is now, and has been throughout her illness, rather cold; the superficial blood-vessels appear congested; the extremities are not cedematous.

The facts of this, which I deem a most extraordinary case, will probably be received by some with a feeling of scepticism. On my part, I shall be happy to give any further explanation of the statements I have made, either by private communication or through the pages of the JOURNAL.

RETROSPECTIVE NOTES ON OUT-PATIENT PRACTICE.

By C. M. DURRANT, M.D., Physician to the East Suffolk and Ipswich Hospital.

DIGESTIVE SYSTEM. (*Continued from p. 114.*)

2. *Congestion of the Liver.* The affection classed under this head might, it may be thought, have been included in one of the varieties of dyspepsia. The symptoms, however, pertaining to hyperæmia, or abnormal accumulation of blood in the capillaries of the liver, differ sufficiently from those of simple dyspepsia to merit and call for a separate notice. Congestion of the liver is a prelude to almost all diseases of the organ terminating in alteration of structure; but, in the cases to which these notes have reference, the affection depended solely upon simple engorgement of the hepatic circulation, and were quite distinct from the passive congestion and enlargement arising from cardiac or other organic visceral diseases.

Patients with this affection generally present a dusky, semi-jaundiced hue. The tongue has a thin yellowish coating. There are nausea and more or less anorexia, although at the commencement the appetite is sometimes ravenous. The chief complaint is of a dull heavy pain in the right hypochondrium. On examining this region, the natural hepatic dullness is increased; and pain is caused by pressing the liver upwards from the costal margin, where we may not unfrequently detect the enlarged and turgid edge of the organ itself. The bowels are for the most part confined, and the excretions dark, offensive, and bilious; and complaint is often made of pain in defæcation, from enlarged and swollen hæmorrhoidal veins. The urine is scanty and high coloured; and in some cases the nervous system sympathises, as evidenced by great mental depression, together with tingling and numbness of the extremities.

In the treatment, a blister applied over the liver at the commencement gives great relief, and tends to shorten the attack. The portal vessels should be drained by saline aperients, preceded, if necessary, by calomel; while the alkalies, with the aromatic spirit of ammonia and spirit of nitric ether, with tincture of colchicum, should be given during the day.

The diet should be light and in moderate quantity, consisting chiefly of fish, broth, and vegetables, without stimulants.

As a subsequent tonic, which is not often required, cod-liver oil acts favourably in these cases.

3. *Diarrhœa*. The affection next in frequency of occurrence has been diarrhœa. This has prevailed chiefly during an epidemic of the disorder; but we have had some sporadic cases, especially in infants, which have been very obstinate, and in two instances almost terminated fatally.

This epidemic diarrhœa, influenced doubtless by atmospheric causes, has immediately depended, apparently, upon vitiated and acid alvine secretions, giving rise to much fermentation and flatulence. If the case be seen early, it is desirable to commence the treatment by giving a mild rhubarb and magnesia draught, containing a few drops of laudanum and chloric ether. Afterwards, the following formula, by correcting the disordered secretions, and giving tone to the nervous centres, has generally completed the recovery.

(Ph. Lond.) R Annon. sesquicarb. ʒss; sodæ bicarb. ʒi; æther. chloric. ʒi; tinct. opii mxx ad ʒss; misturæ camph. ad ʒviij. M. A sixth part every three or four hours.

I have not used chalk mixture, catechu, etc.; but, with two adults, the dilute sulphuric acid, in doses of twenty minims, acted very favourably; and, in some of the infantile cases, this remedy was prescribed with the best effect. I believe that the sulphuric acid treatment will be found to act with most certainty, if it be administered chiefly to cases in which the tongue is moderately clean and pale.

4. *Chronic Gastritis*. A subacute inflammation of the mucous membrane of the stomach is not an uncommon occurrence as an out-patients' disease.

Faulty diet, chiefly from excess, but sometimes from deficiency, if the latter circumstance be long continued, and the quality of the food taken be depraved, especially if to this be added the depressing influence of persistent cold, will, singly or combined, act as a powerful excitant to the disease.

It will be well also to remember that, in the gouty subject, this disorder may be a latent but exciting cause of the gastric inflammation. The tongue is red, more or less glazed, and with a thin creamy coat; the apex being surrounded with fiery, closely set papillæ. There are, anorexia; pain at the epigastrium, increased on pressure, and by taking food, and after vomiting; and a disordered condition of the digestive functions generally. When enumerating the causes, I should have noticed a not very uncommon one among workmen exposed to its influence; viz, the inhaling the fumes arising from noxious gases, or from the ignition of woollen materials, etc.

In the treatment, a few leeches to the pit of the stomach, followed by a large linseed-meal poultice, will often afford considerable relief. A blister may subsequently be applied, if the tenderness remain. A few grains of mercury, with chalk, with extract of henbane, or poppy, will be useful at bedtime; and a mucilaginous mixture, containing chlorate and citrate of potash, I have found to answer well, given during the day.

Perhaps the most important part of the treatment will be the strict confinement of the patient to the blandest milk diet, allowing small quantities of

quite cold water or ice to be sipped or sucked at intervals.

5. *Ascites*. The cases of ascites were only three in number. One was an acute attack, the result of exposure to cold; and the remaining two were passive dropsy, consequent upon chronic peritonitis, which was not, however, of tuberculous origin. In neither case were the kidneys involved; and the heart and liver were equally free from disease.

The acute case was treated by free purging with saline aperients; bicarbonate and nitrate of potash, with the spirits of nitrous ether, being taken during the day. Under this plan, recovery rapidly followed.

In the chronic cases, the treatment was of necessity more prolonged; but these ultimately did well, after blistering the abdomen, giving blue pill and henbane at night, and saline diuretics during the day; to which was subsequently added iodide of potassium, with cod-liver oil. After the healing of the blister, great comfort and benefit were derived from the application to the abdomen of a large plaster, composed of equal parts of mercury and opium plasters.

6. *Hæmatemesis*. We have had a few cases of rather severe hæmatemesis. In two, the hæmorrhage was simply vicarious of the catamenia; but, in the remainder, the cause was traceable to congestion of the mucous membrane of the stomach, which, in its turn, was attributable to confined bowels and a surcharged condition of the portal circulation.

The practical point in these cases is to decide whether the hæmorrhage proceed from mere congestion, or whether it depend upon an ulcer of the stomach, which may be either simple or malignant in its character. In the former case, when arising solely from congestion, the hæmorrhage generally takes place suddenly and in large quantity; the patient feeling faint and oppressed, and often complaining of an undefinable sensation at the pit of the stomach, prior to the occurrence of the bleeding.

When, on the contrary, the hæmorrhage proceeds from ulceration of some part of the coats of the stomach, whether it be simple or malignant in its character, the bleeding is generally much less in quantity; is often vomited, mixed with food; occurs chiefly after a meal; and presents the well known coffee-ground appearance. Besides this, a careful manual examination will sometimes detect an isolated painful spot, or the irregular enlargement of malignant disease.

Hæmatemesis may arise from blood-poisoning; but in this case the previous history of the symptoms, and the general condition of the patient, will sufficiently clear the diagnosis.

The treatment of these cases consisted of a blister to the pit of the stomach; mercury with chalk at bedtime; and saline aperients, with a view to unload the venous capillaries both of the stomach and liver.

The vicarious cases recovered upon the re-establishment of a healthy menstruation.

If the bleeding be very troublesome and persistent, the best astringents are acetate of lead, gallic acid, and turpentine. The perchloride of iron is said to answer well, given as a strong solution.

The patient should, if possible, rest in bed, taking only a bland unstimulating diet, with cold water or ice from time to time while the bleeding lasts.

7. *Melæna*. The cases in which the hæmorrhage assumed this form were, like the preceding, of a simple character, resulting from hepatic obstruction. In these, free daily purging by senna and sulphate of magnesia, giving over-night calomel or blue pill, speedily effected recovery. I have witnessed cases of melæna, after resisting the most persevering and varied use of astringents, yield at once, in the most

satisfactory manner, to the daily adoption of active purging.

I need scarcely add, that care must be exercised to avoid mistaking simple melæna from bleeding from hæmorrhoids, and still more not to confound it with the hæmorrhages from intestinal ulceration or malignant disease.

8. *Intestinal Irritation.* Although scarcely a disease *per se*, still the symptoms under which patients classed under this category labour are so common and so uniform, that, practically, it may be desirable to give it a separate notice.

There is pain, often very severe, but not increased by pressure, in some part of the intestinal tract, generally at or around the umbilicus. It is very frequently accompanied by reflex neuralgic pain at the sides of the abdomen; also in the rectum, and over the sacrum, extending sometimes to the genitals in the male, and to the inguinal regions in the female. The tongue is coated, and it has a reddish tip. The appetite may not be much interfered with. There is much flatulence; and the bowels are alternately constipated and relaxed, the evacuations being very fetid, and of a particoloured and unhealthy character. The urine is generally clear, high coloured, and with an excess of uric acid.

These symptoms depend upon a faulty condition of the contents of the bowels, giving rise to congestion of the mucous membrane and enteric pain.

The exciting cause is most frequently cold; to which may be added improper food, and the many depressing influences to which the labouring poor are so constantly exposed.

At the commencement of the treatment, a mild dose of castor-oil, guarded with laudanum, will be desirable; and alkalies, with mucilage, henbane, and chloric ether, will be the most suitable combination.

The cutaneous neuralgic pains are often more distressing to the patient than the immediate phenomena referable to the bowels themselves. Mr. Hilton, in his valuable *Lectures on Rest*, etc., strongly, and as the result of a long experience, recommends the more frequent application of anæsthetics to the peripheral extremities of the nerves. "I believe," says Mr. Hilton, "this plan of treatment—I mean the application of anæsthetics to the cutaneous nerves—is, as a rule, most imperfectly carried out in practice." For this purpose, he recommends *strong* solutions of belladonna, opium, or hemlock; and further adds his belief that "the reason why these applications are not more frequently employed, and why they are so often ineffective, is, that the solutions are not strong enough, and that the proportion of the materials is not sufficient." In the neuralgic pains under consideration, the extract of belladonna, freely smeared upon the part, will often give much relief; or, this failing, a strong solution of opium may be tried.

9. *Malignant Disease of the Bowel.* These cases were, happily, only two in number; and in each instance the relief that we were able to afford was but slight and very temporary.

The first case, in the absence of a *post mortem* examination, was, I believe, a thickened and contracted condition of the cæcum, of a malignant character. The patient suffered great pain; he had passed blood and sanious matter *per anum*; and he was rendered much worse by the flatulence engendered during digestion. This case ultimately died; but an inspection of the body was unattainable.

The second case was one of carcinoma of the rectum, accompanied by much pain, and purging of what the poor fellow himself graphically termed "bloody corruption". Opium gave very partial relief, and his attendance at the hospital was discontinued.

In a case of extensive cancer of the rectum, accompanied by great abdominal pain, preventing sleep, and with whom opium, given internally, entirely destroyed the appetite, Mr. Hilton was induced to advise a strong solution of opium to be rubbed upon the abdominal parietes every night and morning. "From that time," adds Mr. Hilton, "the patient had scarcely any pain, or spasmodic abdominal contraction; he required no more opium by the mouth to make him sleep; and he regained his appetite."

10. *Mesenteric Disease.* Affection of the mesenteric glands is a malady of very frequent occurrence, especially among children as out-patients. In two or three of the applicants, the disorder had advanced so far, and the tubercular deposit had produced such extreme emaciation and debility, that death was the only termination to be looked for.

The cases which present most frequently, however, are those termed by Dr. Ferguson "*meseraiaisis*". In these, the glands are congested and irritable, and more or less enlarged; but their functions, as yet, are not so much impeded as to prevent recovery, if judicious remedial measures be adopted. The experienced eye of the practitioner will at once detect the peculiar abdominal expression of the little patient. The face is anxious, thin, and drawn; the eyes sunk, but often preternaturally bright, with a dark line below the orbit. The child is fretful, and complaining of pain in the body. The skin is hot, and over the abdomen pungent; the tongue red at the tip, with a white creamy fur; lips often sore and ulcerated from picking; appetite very capricious; and sometimes vomiting. The bowels are generally relaxed, with most offensive, unhealthy evacuations; the urine variable in colour; abdomen swollen, tense, and tender upon pressure. The legs are often drawn up upon the body. There is general wasting, especially of the extremities; and increasing debility. These cases, if seen early, and before the glands become much infiltrated with cacoplastic or tuberculous matter, offer a reasonable chance of recovery, especially if tonics be not administered (as I believe is often the case) too early. The plan that I have found to be most useful is the following.

As perfect rest in bed as it is possible to obtain, in order to lessen peritoneal friction. A large thin linseed-meal poultice, sprinkled freely with laudanum, and covered with oil-silk, should be applied to the entire abdomen. After poulticing for a day or two, the belly should be covered with a plaster consisting of equal parts of opium and mercury plasters. The bowels should be regulated with the mildest aperients; and, in general, none answer better than rhubarb and carbonate of soda, guarded, if necessary, with Dover's powder.

It must be recollected, that the improvement in the appearance of the evacuations takes place very slowly in these cases; and that it is not desirable or safe to use active or irritating measures in order to effect this object.

In addition to this, I have found the best result from a combination of the citrate and chlorate of potash, with tincture of opium and chloric ether, apportioning the doses to the age of the patient. When the febrile symptoms lessen, and the tongue improves, the cod-liver oil will be the best tonic, in addition to the mixture. I am persuaded that I have often seen much harm done in these cases by the too early exhibition of steel and iodide of potassium.

The diet should be of the lightest kind, consisting chiefly of milk, with farinaceous articles. A very lightly boiled egg will sometimes agree, and be enjoyed, when other food is refused. If broths be allowed, the mildest only, as chicken-tea, should be

selected at first. A small quantity of sherry with water may, I think, in most cases, be advantageously given at intervals during the day.

As the patient improves, the abdomen should be enveloped for a prolonged period with a well adjusted flannel bandage.

The point which strikes me to be particularly observed is the avoidance of a too early administration of tonics, or a diet that will overtax the very much weakened digestive organs.

[To be continued.]

Transactions of Branches.

BATH AND BRISTOL BRANCH.

ON EXCISION OF THE WRIST-JOINT.

By R. W. COE, F.R.C.S.E., Senior Surgeon to the Bristol General Hospital.

[Read January 25th, 1865.]

ON regarding the results of operations for the removal of diseased bone from the carpus, we cannot but be struck by their unfavourable character—a character certainly not dependent upon the complex anatomy of the carpal joints, nor upon the tendinous structures in their neighbourhood; for it is well known that no class of injuries is more quickly recovered from than those affecting the hand or wrist requiring immediate operation. It must be familiar to us all how after partial crushing or severing of the hand or injury by gunshot, that it is the rule for the sound portion to be saved, on the injured part being removed; though in the doing this, the carpal joints may be freely opened, some or all of the carpal bones taken away, and tendons cut through.

These cases afford an illustration of the reparative powers of the upper limb; and if we compare the results of these injuries with those of corresponding injuries in the lower one, we shall find them to be more favourable than in the latter, shewing that the powers of reparation are greater in the upper limb than in the lower. Yet if we compare the results of the removal of diseased bone from the carpus, with those of excision of the tarsal bones for the same cause, we find the balance much in favour of the latter—a consequence for which *a priori*, I think we should hardly be prepared.

Dr. Humphry in a note to his published Address on Surgery, delivered at Cambridge (1864), has truly stated the reason of the difference. After observing that the reparative powers in the upper limb are greater than in the lower, its exposure to injuries less, and its opportunities for repose greater, he says: "Hence a given amount of disease in it is, proportionately, more indicative of constitutional debility than in the lower limb."

In considerations of this nature must be sought the explanation of the frequent unfavourable results of operations on the joints of the arm, especially on the wrist. It may, with something approaching to accuracy, be said that diseased bone when resulting from injury to the lower extremity, is produced by a faulty local nutrition primarily, and secondarily by a constitutional taint; whilst in the upper limb the same condition is brought about in spite of the local energy of the part, and in consequence of a constitutional taint. If this be so, what inducements are there for the surgeon to operate in affections of the wrist-joint, it being avowed that the results have been on the whole not only somewhat less than favourable—indeed positively unfavourable.

It must be borne in mind that the comparisons I have instituted are very rude, and the statements proportionately general; there are consequently many exceptions to be made. It is by the recognition of these exceptions that we may hope to discover the cases which will repay our labour.

A rough classification of the diseases of the joint compared with the results of the recorded cases will, I think, clearly shew what the inducements are, and when we may hope for a favourable issue. Excluding those cases where injury to the hand or wrist is immediately followed by operation, I would divide the wrist-joints injured by violence or disease into the following classes.

1. Those where the violence is followed by acute inflammation of the joint and soft parts, interfering with their nutrition, and ultimately causing a true necrosis of the carpal bones by preventing their blood supply.

2. Those where a slight injury, as a sprain or blow, is followed after some interval of time by a slow chronic inflammation, which takes its character from a constitutional condition, and which may eventually present every sign of a specific disease; the injury to the joint having the same relation to the developed disease that a blow on the breast has to the development of cancer in that organ.

3. Those where the disease, of whatever nature, is idiopathic, and the mere expression of a constitutional cachexia.

In looking over the recorded cases, I find the success of the operation following the order of the above division being most perfect and most frequent in the first class. In the second, the result hardly to be called a success, and this partial success but infrequent; whilst amputation after the excision seems to have been the rule in the third class.

In the first class of cases, I should say that the operation of excision was imperatively called for. Of the second, I speak with more diffidence. It has been clearly shewn that many so-called strumous affections of joints are amenable to treatment when continued through a sufficient length of time, rest being esteemed a principal element. When this has failed, the sooner the excision is performed the better; for the disease continuing, forms a nidus for the constitution to act upon, and to be in turn affected by; and if the operation fail, amputation can be had resort to under but slightly, if any, increased disadvantages. Of the third, I can only refer to the results, which are so unfavourable as to demand amputation.

How the carpal bones, and, if necessary, the carpal extremities of the radius and ulna and metacarpal bones, can be best excised, is the point I wish principally to bring under your notice this evening. Of the value of the mode I advocate, you will have an opportunity of judging by the inspection of one of my cases; but brought rather earlier under notice than I wish, from its being doubtful whether I should be able to present her at our next meeting in Bristol.

Erichsen has removed the carpal bones through a long longitudinal incision over the dorsum of the wrist; also, by a flap uncovering the tendons, and picking the bones out from between them. Ferguson has removed them by two lateral incisions; also, by a flap over the dorsum, leaving the tendons. Simon has removed them by two longitudinal incisions, one over the dorsum, the other on the palmar aspect, passing between the tendons—a proceeding not very likely to find imitators. Stanley has operated by a flap on the dorsum, cutting through the tendons, and turning them back with the flap. Butcher takes credit to himself for what he calls a

new operation: viz., by a flap on the dorsum, beginning on the ulnar side of the extensor secundi internodii pollicis, thus leaving the extensors of the thumb uninjured. It is very doubtful, however, whether he improved much upon Stanley's operation; for it would require a special bungler to cut through the extensor ossis metacarpi pollicis and extensor primi internodii pollicis in turning up a flap from the dorsum of the wrist. Spence of Edinburgh has lately adopted the two lateral incisions.

Of these modes, Stanley's and Butcher's have obtained the best results; but rather depending upon the class of case operated on, than on the kind of operation; and each of these has this great disadvantage, that all extension of the fingers is lost.

I find that a lateral incision on the ulnar side of the wrist beginning half way up the side of the fifth metacarpal bone and terminating two inches above the end of the ulna; a dorsal incision, beginning over the upper end of the second metacarpal bone, and carried obliquely over the wrist on the radial side of the second extensor of the thumb; and, if needs be, a third incision in the palm, an inch and a half in length, over the upper end of the metacarpal bone of the thumb and prominence of the trapezium, for the purpose of taking away this last bone, which is the only one there is any real difficulty about. Give room enough for the removal of all the carpal bones, together with the ends of the radius and ulna and metacarpal bones, not exposing the tendons and rendering them liable to slough, as in the superficial flap operations, nor destroying the extension of the fingers, as in the deep flap operation of Stanley and Butcher; in fact, if the operation be successful, preserving all the functions of the hand, indeed there is no necessity, if these incisions be adopted, for cutting any tendon, artery, or nerve.

I will not take up your time by detailing at length the two cases I have operated on. Suffice it to give the following statement of the first.

Aaron Morse, aged 34 years, engine-driver, was admitted under my care at the General Hospital on June 17th, 1858. His disease was said to have been injury of the right wrist, followed, after two months, by inflammation of the carpal and wrist-joints (probably of a strumous character), and subsequently by necrosis of some of the carpal bones.

His history was that, in September 1857, he stumbled over a railway switch-handle, and fell on the palm of his outstretched right hand. He jumped up, not having apparently suffered any injury. He continued to work until November, when he was obliged to give up; his hand having become swollen and painful. He was treated by Mr. Morgan of Newport, who first blistered and then leeches the wrist—upwards of seventy leeches having been applied.

A swelling eventually pointed over the first metacarpal bone, which was opened by caustic. He had had altogether three small swellings open and discharge near the wrist.

His appearance and condition on admission were described as follows.

He looked somewhat pulled down and cachectic, with a strumous aspect, partly due to a loss of blood from the anus, following a dose of castor-oil taken a week before. The whole of the back of the carpus was swollen, but not painful. There were three old openings leading to the wrist; one on the upper and inner side of the first metacarpal bone. The bone was not to be felt by a probe passed through it. A second opening existed between the upper extremities of the second and third metacarpal bones, leading down to the os magnum apparently, which was quite necrosed and moveable. And there was a third between the upper extremities of the third and fourth

metacarpal bones, leading down to the carpal bones, but through which no bone could be felt. The whole discharged a glairy looking matter, as if formed by pus and synovia mixed. Over the inner side of the styloid process of the ulna was a small abscess, which I opened. From this there escaped discharge of the same character as that which came from the old openings. A probe introduced through this new opening passed deeply among the bones of the carpus without touching any bare bone.

On June 23rd, I removed his carpal bones, with the exception of the pisiform, by means of the incisions I have already described. He progressed satisfactorily, and left the house in August, with only a sinus unhealed. I heard favourable accounts of him from time to time; but in a few months he died of phthisis.

This case is almost a typical one of those of the second division. Its history and appearance prior to operation, and subsequent behaviour, may fairly represent the origin and course of most of the recorded unfavourable cases. The slight injury, followed after some time by signs of irritation; that irritation of a specific character; the character dependent upon a constitutional diathesis; and all the stronger probably from manifesting itself in the upper extremity. The interference with the healing process and the ultimate death were both due to the general affection.

I learnt from this case, that the operation, performed in the manner I advise, in a fitting subject, would, in all probability, be followed by a successful result as regards the functions of the hand.

I had not an opportunity of testing this until September of last year, when I removed the carpal bones and ends of the radius and ulna under as disadvantageous conditions as are likely to be met with, excluding the almost fatal complication of a specific constitutional diathesis.

How gladly ought we, then, to welcome any conservatism which will retain for its possessor such a priceless gift. That conservative surgery has done much for this patient, I think she feels; for, with the elbow- and wrist-joint both removed in the same arm, she yet possesses what promises to be a very useful, and is certainly a most seemly looking limb. No person casually looking at her could tell that she had undergone any operation.

Elizabeth Jones, aged 40 years, a domestic servant, was admitted under my care at the General Hospital on May 13th, 1864, for an obscure affection of the left elbow-joint. The character of the disease gradually developed itself; and I removed the joint on July 21st. Although she suffered from cellular inflammation round the seat of operation, which threatened to be diffuse, she recovered by the latter end of August, and was able to move about the ward; the wounds having healed, and there promising to be a very useful false joint.

After getting about a few days, she had a rigor, which was followed by diffuse cellular inflammation of the forearm and hand of the same side. Incisions were at once and freely made; but the first phalanx of the little finger was found bare, as also the carpal bones. The discharge was very profuse; and the constitutional irritation so exceedingly great, that her life was threatened.

It became necessary to remove the then source of the irritation, either by removing the arm above the elbow-joint, which it would have been useless to preserve; or the wrist and ends of the radius and ulna. My colleagues assented to my doing the latter, on the understanding that I should at once remove the arm, if her system did not rally.

On September 22nd, I excised the carpus and ends of the radius and ulna. Within forty-eight hours,

the patient was much improved in health. The local condition also steadily improved, care being taken to provide a free egress for pus, at one or other side of the wrist, as occasion arose. Her general treatment, I need only say, was of the most supporting character.

Her present condition you will be enabled to judge of. Her elbow has every movement; though, from the necessity there has been for keeping it quiet, it is not so free at present as it would otherwise have been. When under chloroform, however, the arm can be moved freely in every direction. Her fingers are yet stiff, and the wrist somewhat lax; but I have little doubt but that she will regain full power over the fingers, and that her wrist will become strong and firm. Both these changes are making themselves evident from week to week.

It is not for me to dwell, before such an audience, on the wonderful and complex structures which fit the hand for its various functions; yet it is right, in discussing the propriety of any operative proceeding, to bear in mind, and bring prominently under notice, the manifold services such an organ as the hand performs for its possessor. It is the exponent of his emotions, the asserter of his rights, the slave of his will. It is the giver of formal expression to the genius of the artist, the engineer, and the mechanic. It is the special instrument whose cunning gives rise to the appellation which includes the great industrial community of our land—the “handcraftsman”; and, while priceless to the liver by its labour, it appears scarcely less valuable to the merest idler.

If such be its uses, how incalculably great must be its loss; and what a triumph to our art to succeed in preserving, even in a mutilated form, an organ of such infinite value! A solitary finger is worth something: a finger and thumb more to be esteemed than any artificial contrivance whatever.

The surgeon naturally witnesses much suffering, and himself inflicts many and serious mutilations. He must indeed by stoical who passes by all unmoved; but different men are affected in different ways and by diverse circumstances. For myself, I confess to more mental pain on removing or seeing removed an arm or hand, than from any other surgical proceeding. A man's individuality seems more affected by this mutilation than by any other; he appears more helpless, less able to make his mark upon the world, more needful of sympathy, kindness, and help.

ARMY MEDICAL SERVICE. The next examination of candidates for the army medical service takes place at Chelsea on the 20th inst. On this occasion the examination will embrace candidates for the Indian medical service as well as for the army medical service.

TRAINING OF IDIOTIC CHILDREN. Mr. C. Brady, in a pamphlet entitled *The Training of the Idiotic and Feeble-minded Children*, describes a visit made by him to the Asylum at Earlswood, etc. Mr. Brady recommends for the 7,000 imbeciles who, according to the last census, are in Ireland—“1. The foundation of a general institution for the reception of all degrees of idiocy, from the hopeless to the most improvable. 2. The opening of an asylum for the pure idiots, who are not susceptible of much improvement, but who can be housed, cared for, and cured of bad habits. 3. The establishment of a training school for the improvable cases, where, as in the asylums of which I have attempted a description, they may be trained to habits of usefulness, rendered able to earn a livelihood, and be taught the way of salvation.”

We beg to remind the members of the Association that the annual subscription is now due. Payment of the same can be made either to the Honorary Secretaries of Branches; or to the General Secretary, T. Warkins Williams, Esq., 13, Newhall Street, Birmingham.

British Medical Journal.

SATURDAY, FEBRUARY 11TH, 1865.

THE POOR-LAW OFFICIAL'S REPORT ON TIMOTHY DALY.

MR. FARNALL has given in his report upon the case of Timothy Daly: No blame attaches to Mr. Norton as medical attendant of the man; and no blame attaches to the Poor-law system in reference to its dealing with the case! It was necessary, however, to find some scapegoat—to blame somebody; and the doctor, therefore, has, of course, received censure.

“I beg to inform you, with Dr. Carr's sanction, that in his opinion, and in my opinion, the evidence taken at this inquiry does not establish the charge publicly brought against Mr. Norton, the medical officer of the Holborn Union Workhouse, of having ill-treated and neglected Timothy Daly, while he was an inmate of that house.” In reference to the alleged neglect of Mr. Norton, as regards the entries in the “workhouse medical relief book,” Mr. Farnall adds: “If Mr. Norton had kept this book, he would have been enabled to produce a faithful record of the days when he attended Daly, and of the dietary which he ordered. I consider Mr. Norton's conduct to have been very careless in this matter, and it appears to me to deserve your censure.”

Mr. Norton is blamed for not having fulfilled to the letter some one of the thousand minute formulæ which are demanded of Poor-law medical officers, and which we believe would, if carried out to the letter, occupy as much time as is devoted to the actual business of attending on the sick. Still it is officially declared that Mr. Norton, as regards the treatment of Timothy Daly, is free from all blame. But while Mr. Farnall, the Poor-law official, is ready enough to throw a stone at Mr. Norton, in order, we may assume, to blind the public, and screen his own masters from blame, he takes good care to do and say nothing which can indirectly cast suspicion or discredit upon the working of the Poor Laws. In this he exhibits the true spirit of a paid official; he shows that above everything in this inquiry is the saving of his masters from public censure. In doing this, to say the least of it, he has acted very unjustly. Mr. Farnall has great faith in Dr. Carr; he called him in to assist in the inquiry concerning Daly's death; and at every step he quotes Dr. Carr, where he can do so to the advantage of the “system.” Why does he stop there? Has he acted

fairly to all parties in doing so? and, above all, to those most concerned in the matter? Dr. Carr is quoted by him freely enough to prove that at the Holborn Union, bedding, food, ventilation, etc., in the sick ward, are all excellent; and to show, in fact, that in the death of Daly the system is blameless. Now, we ask, has this Commissioner acted honestly towards the public, and to Mr. Norton, when he makes no comment or reference to that part of Dr. Carr's evidence, which indirectly throws the very severest censure on the system, as worked out by the Guardians of the Holborn Union? What is the meaning of the following words of Dr. Carr's report, if they do not distinctly say this:—You have no right to expect that your pauper patients will receive proper medical treatment unless you pay your medical officers properly? Here are Dr. Carr's words.

"On the subject of the medical officer, I would respectfully suggest, looking at the large amount of duty which he is expected to perform, that some change should be made in relation to him; 1, That the drugs should be supplied by some respectable wholesale druggist, and paid for by the Guardians; and, 2, That his salary should be raised to £150 per annum.

"This additional expense would, I doubt not, be followed by real and positive good, alike to paupers and Guardians.

"I would also suggest that two properly educated nurses should be appointed, and paid sufficient salaries to command a high-class character, who would raise the tone of feeling in the wards, and prove a source of help and comfort to all concerned, who would save life and spare the expenditure of the rates.

"Remembering that the poor are always with us, the object of the Legislature should be to provide a remedy at once economical and preventive; erring not by meanness, which propagates the evil of pauperism, nor by extravagance, which wastes the rates levied from the industrious classes. Moderate and liberal policy is often, if not generally, the wisest course of conduct.

"WILLIAM CARR, M.D., F.R.C.S., etc.

"Blackheath, January 24th, 1865."

Could any more severe censures be passed upon the Poor-law guardians than are contained in these words? Mr. Farnall knows, as well as we do, what they imply. They say, as plainly written as words can be: *You, the Poor-law guardians, are guilty of neglect; you have injured the sick poor placed under your charge; you injured Timothy Daly, by refusing to give him and them the proper medical attendance, the proper medicines, and the proper nursing which he and they require.* Dr. Carr has told the Board that which doubtless they knew well enough before; but he has told them, as one of their own temporary official advisers, that their pauper sick suffer—i. e., are not duly cared for—because they do not pay properly for attendance on the sick. Mr. Farnall has, therefore, we must again repeat it, acted meanly and unfairly to Mr. Norton, in not boldly repeating, in his report, what Dr. Carr has thus truly and honestly stated. Mr. Farnall, instead of doing this—instead of censuring the Holborn Board—has screened them,

by unjustly throwing blame on Mr. Norton. And does not all this show that official inquiries of this kind, carried on by the official officers of the "system", are simply a delusion and a farce—not meant to get at the truth, but only to screen the system from censure.

One word, however, we must add of a more strictly ethical professional kind. It is clear that, if it had not been for the unnecessary interference of one of his own professional brethren, Mr. Norton would have been saved all the great pain and anxiety and obloquy to which for the past month he has been so unjustly subjected. Mr. Lowne saw Daly after his removal from the Holborn Union. He therefore

"Wrote a letter to Mr. Shuter, the honorary Secretary to the Farringdon Dispensary, setting forth his view of Daly's case, upon which Mr. Shuter immediately visited Daly in Mr. Lowne's presence, and at once requested Mr. Lowne to modify the letter referred to, so that it might be made fit for publication in the *Times* newspaper. Mr. Lowne did as he was desired, and, dating his modified letter December 17th, handed it to Mr. Shuter. Six days after this occurrence, after Daly's removal by Mr. Lowne to St. Bartholomew's Hospital, Mr. Shuter addressed a letter to the editor of the *Times*, in which he embodied Mr. Lowne's letter of the 17th of December. Mr. Shuter headed his letter with the words 'Horrible Case of Union Treatment,' and thus it appeared in the *Times* newspaper of December 24th, and so brought Daly's case before the public, who were invited to view it with disgust and resentment. Mr. Shuter says that he published this letter out of mercy to the poor; but he also admits that he wrote it with some desire to attack the Poor-law Board."

Mr. Lowne, it thus appears, without making any inquiry from Mr. Norton about the nature of the case of Daly, assists Mr. Shuter in rushing into the *Times*, and thereby injuring Mr. Norton. The result of the inquiry proves, as we have said, that Mr. Lowne's proceedings were very blameable. He imputed blame to a professional brother without a sufficient knowledge of facts. To Mr. Norton the profession, therefore, must accord its sympathy, and visit with its censure those who have so cruelly injured him.

PRIVATE GRATUITOUS MEDICAL SERVICES.

THERE is one species of the system of gratuitous medical services prevalent in the metropolis, as well as elsewhere, which is deserving of particular condemnation. We regret to say that it is practised even by some of those who are of high standing in the profession. The system to which we refer, is that of doing business, on a large scale and regularly, in the gratuitous advice way at their own houses.

Reduced to its simplest expression, the proceeding is nothing but a private advertising move; there is not a grain of real charity in it. The trick (for so we must call it) no doubt answers the purposes of those who practise it; but it is degrading to the dignity

and injurious to the interests of the profession at large. These gratuitous advice-giving gentlemen are indiscriminate in their gifts of advice. All they seem to desire is to have a well known street door. We have heard of paying patients seduced in this way from a neighbouring practitioner's house; and we have also heard of cases in which the gratuitous patients, sick of waiting their turn in the benevolent man's consulting-room, have gone to a neighbouring practitioner's and paid their guinea. We need hardly say that, as a pretence at benevolence, the whole thing is a brazen-faced sham. Selfishness is at the bottom of the whole business. The numerous visitations to their house, implied in the gratuitous advice, is a publication of their name and address—the patients acting as hookers-in; and, besides this, the gratuitous patients cram up the hall and make a show, and fill the minds of the paying patients with wonder and admiration at the “immense reputation and benevolence of the doctor.”

One of this class of advice-givers had, and, for all we know, still has, a most ingenious method of displaying and utilising his gratuitous patients. His plan was to plant them round the room through which his first class patients had to pass before they gained admission into his presence; and as his specialty was the cure of an incurable disease which involves a good deal of coughing, the paying patient passed, in bewilderment and admiration, through a perfect explosion of barkings, wheezings, and all the different varieties of sounds which represent defective respiration, before he could gain the presence of the great curer. Of course, the impression made upon his mind by the display was, that the doctor was a profound genius and enormously benevolent. We need hardly tell our readers what sort of benevolence really stirred this individual's breast. He kept the third class patients there as long as their services were required; and then rapidly started them off with a prescription, to be taken to a special druggist, with whom (if report be no lying jade) he shared the plunder of a thirteenpenny bottle of physic.

AN ACTION FOR FEES.

THE Lord Chief Justice Cockburn has always shown himself a warm supporter of the honour and dignity of our profession. In the case of *Tamplin v. Cosens* (reported at another page), which lately came before him, he gave his entire support to the professional side of the case. We must, therefore, congratulate Mr. Tamplin on having successfully asserted what he considered his rights in a court of law. We would, however, remark—and we are sure that the feeling of the profession, and no doubt of Mr. Tamplin, is with us—that the more rarely medical men, and especially men in a high position in it, appear as claimants for fees in a court of law, the better is it for us as a professional body.

No doubt Mr. Tamplin had good and sufficient reason for taking action in this particular instance—more so, perhaps, than appears before us; but still the public will not always take a pleasant view of such proceedings. It would, indeed, perhaps be well if our leading surgeons, operative and consulting, should stand, as regards their fees, in the position of honorary claimants only; and, as a rule, such, we believe, is their position. None of us would like to see our Sir Benjamin Brodies or Sir Astley Coopers suing for fees in a court of law. It is certain, moreover, that men in high repute, either as physicians or surgeons, are the last men in the profession who have occasion to make, or are justified in making, such claims. The fees usually paid to them for visits and operations are notoriously, as a rule, high fees, and, moreover, are religiously paid.

We must add, as regards the particular case in question, that it may be fairly questioned, from a professional point of view, whether it is right that a surgeon or physician should continue for a year or two in constant attendance upon a patient (without receiving or claiming his fees), unless there is a distinct understanding as to the payment of the fees. Candidly speaking, it seems to us that a patient would be justified in believing—might reasonably believe—that his physician or surgeon would not charge him the full tariff for a daily attendance, for eighteen or twenty months, on a case where there was little or nothing to do daily, and where repose and nature were mainly effecting the cure—unless it was distinctly understood that the full payment of fees was to be made. In such cases, it seems to us evident, that the physician or surgeon should either take or demand his fee at each visit, or should have a distinct understanding as to what his fee is to be at the conclusion of his anticipated lengthy attendance. Surely a patient might not unreasonably object to his doctor, in a case of the kind supposed, that it was hardly fair to come down upon him, at the end of a couple of years, with a charge of three or four hundred guineas for as many attendances, unless the doctor had already at starting distinctly explained to him the terms of his attendance. The payment of such a sum would be to most men, who have to get their living by professional labour, a very serious difficulty. At all events, if the doctor in the case supposed is determined to maintain the professional tariff of one guinea per visit, he should, in our opinion, make his charge an honorary one; and so leave it to the patient's honour or conscience for settlement.

A NEW objection has been thrown in the way of the utilisation of sewage, and one which has probably occurred to few of our readers. Dr. Cobbold, our highest authority on helminthology, warns us that

we may be ruined and overwhelmed by entozootic diseases, if we spread this sewage as manure over the country. He has published a pamphlet with a formidable title, which explains, however, its contents: "New Entozootic Malady: Observations on the probable Introduction of this formidable Disease, and on the almost inevitable Increase of Parasitic Diseases in general, as a Consequence of the proposed extensive Utilisation of Sewage." We feel bound to say that a perusal of this pamphlet has much relieved our mind of the fears which were raised by reading the title. Dr. Cobbold leaves a very wide hiatus in the tale of how the eggs of the *Bilharzia*, when distributed in the sewage over the land, are to find their way into the human body. He traces them into the bodies of land and water snails, and there he leaves them. But there is always what has seemed to us an unanswerable answer to all those who argue as Dr. Cobbold does, and it is this: There is no shadow of proof that any entozoon can or does survive in meat which is properly cooked. Even, therefore, if we suppose, by a stretch of the imagination, that the fears of Dr. Cobbold may be realised, we clearly have the remedy in our own hands. Of course, if people will act the part of cannibals, and eat raw meat, they must be prepared for the consequences which ensue from such unnatural doings. But the truth is, that the possible consequences of the eating raw meat are unknown to those who indulge in that propensity. Ignorance here is the source of disease, just as it is in a thousand other deviations from the laws of nature which produce disease, and are daily practised around us. Our right business, therefore, should be to enlighten ignorance, and in this way prevent the introduction of live entozootic animals into man's body. Of course, we are not wishing to recommend the raising up of entozoa to infest our beef and mutton; but, as we have in our kitchens a positive destroyer of all danger of infection from that source, and as Dr. Cobbold seems to have failed in a satisfactory proof of the connexion between the spread of sewage over the land and the increase of entozoa in man, we cannot hope that his objections will interfere with the realisation of an immense national blessing—the utilisation of our sewage, and the purification of our rivers.

THE fifth Annual Report of the Cranley Village Hospital, just issued, gives a very satisfactory account of its success. Every one must rejoice at the progress of so excellent an institution. It is greatly to be hoped that similar hospitals will become general throughout the country. Their advantages in every respect are very great. They bring relief home to the working man's door; they are very economical; they are also salubrious, being small in size; and they give our brethren in country dis-

tricts a good field for the cultivation of their profession as a science, and in so far tend to improve our art. Only one objection we must raise to them, as at present carried on; and that is, that they do not pay their medical officer. On what grounds should the medical man give his gratuitous services to them, we beg to ask?

THE Manchester Medico-Ethical Association has published the subjoined advertisement in all the Manchester daily papers. In doing so, it has set an example worthy of imitation by other influential medical bodies.

"*Manchester Medico-Ethical Association.* At the annual general meeting of the Association, held on Wednesday, the 25th inst., at the Clarence Hotel—Sir James L. Bardsley, M.D., President, in the chair—it was unanimously resolved:

"That this Association has great pleasure in publicly expressing its thanks to the proprietors of the *Manchester Guardian* for having excluded licentious and immoral quack advertisements from a paper so influential and of such extensive circulation; also, to the many other journals which have given up the somewhat lucrative but dishonourable practice. The Association begs to express its high sense of a proceeding which, though inseparable from an honourable press, has yet too few imitators.

"JON. WILSON, F.R.C.S. } *Hon. Secs.*
JNO. THORNBURN, M.D."

THE French Academy of Medicine has been engaged in a learned, lengthy, and serious discussion about the transmission of syphilis through vaccination. It seems passing strange to us to note all this wondrous waste of time and eloquence—this veritable logomachy. We suppose that two words will sum up all the *facts* of the case; and that, in truth, every one is agreed as to the nature of those facts. Why, therefore, all these grand displays of oratory from the Ricords, Depauls, and Trousseaus of our art? That syphilis has been and may be transmitted through vaccination seems to be a positive fact acquired to science; but, as M. Trousseau and his colleagues admit, such transmission is "not only rare, not only very rare, not only excessively rare, but is prodigiously rare." Why, then, it is asked, make all this noise and fuss, why set all society in agitation, why excite all this emotion, about an event which happens so rarely as to be an actual prodigy, a kind of miracle, when it happens—an event, moreover, which, there is every reason to believe, has never happened except through the sheer ignorance or carelessness of the vaccination? The end of Trousseau's long oration is just this: The transmission of syphilis by vaccination is excessively rare; but it is a fact which ought to be known. But who does not already know the fact?

GUERSANT ON VULVITIS IN CHILDREN.

M. GUERSANT writes as follows in the *Bulletin Général de Thérapeutique* for November 30th, 1864.

Inflammation of the vulva in children may be met with under the following forms: 1. Simple; 2. Diphtheritic; 3. Ulcerative; 4. Gangrenous; 5. Syphilitic.

1. *Simple Vulvitis* commences with very slight erythema of the mucous membrane of the whole vulva, with or without itching. It is met with in very young children, sometimes a few weeks after birth, and is characterised by redness and itching, with mucous exudation. It is caused by want of cleanliness, and is the source of the leucorrhœal discharge so common in female children. When detected, it can be arrested by lotions of cold water, pure or slightly astringent. If this application be neglected, it frequently happens that the labia become glued together; sometimes the adhesion is congenital—has been formed before birth, although M. Guersant has never met with any positive instances of this. He has often been consulted by the parents of children, and even by medical men, regarding supposed cases of obliteration of the vagina. In these cases, the labia majora had become adherent by very thin transparent false membranes, analogous to those which are met with between the prepuce and the glans in boys who have had balanitis and in whom the glans is not uncovered. This false membrane glues the labia together, but does not cover in the urinary meatus. It is readily torn by means of a probe, or even by gently separating the labia. The performance of this slight operation averts the production of more solid adhesion, which may occasion inconvenience and require a more formidable proceeding when the catamenia appear. When the labia have been separated, it is a good plan to place between them some charpie (or lint) to prevent fresh adhesions; lotion of acetate of lead should also be applied three or four times a day—it may prevent a return of the condition, which recurs rather frequently.

M. Guersant has sometimes seen vulvitis produced by ascarides (*oxyures vermiculares*) which had passed from the anus to the vulva. In these cases, the children have intolerable itching. The best remedies are, mercurial inunctions, calomel suppositories, injections of infusion of wormwood, and sulphur-baths.

2. *Diphtheritic Vulvitis* is characterised by the presence of false membranes. It is met with either in children who do not yet present any other morbid manifestations, or, more frequently, in those who have or are threatened with diphtheritic disease of other parts, as the pharynx, larynx, and tonsils. The internal surface of the labia majora is lined with white false membranes, more or less solid, analogous to those which are met with on the tonsils. When one of these false membranes is removed, the subjacent tissue bleeds. They have a tendency to be reproduced; the inguinal glands are often enlarged; the patient is more or less depressed; and there is often fever.

The appearance of this affection denotes frequently that the child is seized with a general diphtheritic attack; and hence it ordinarily resists local means, and even general remedies rarely subdue it. But, although the prognosis is serious, local and general treatment must not be neglected. The local means consist of the application of nitrate of silver, either solid or in solution; lemon-juice may also be applied successfully, as well as insufflation of alum and tannin. These remedies are most likely to succeed when the disease is purely local; otherwise, general treatment alone can modify the disease. This diph-

theritic false membrane must not be confounded with that met with in syphilitic children; these have generally other symptoms, such as chancres, etc.

3. *Ulcerative Vulvitis*. It is not rare to meet in young female children with ulcerations or excoriations on the inner surface of the labia majora. They are met with in neglected cases of simple vulvitis; they also arise from want of care in children who have leucorrhœal discharges; or they may be produced by repeated masturbation. They have no syphilitic character; and are nevertheless sometimes accompanied by *plaques muqueuses*. The ulcerations and excoriations yield to local applications, general and local baths, astringent lotions, lemon-juice applied locally, chlorinated water, nitrate of silver, but especially to careful cleanliness. The labia must be kept separated.

4. *Gangrenous Vulvitis* is frequently a termination of the affections which have been described. It occurs only in children whose general health is in an unfavourable condition. It has been observed as a result of fevers, adynamic diseases, and certain severe forms of scarlatina. It is characterised by a transformation of the mucous membrane of the labia majora and the entire vulva into a blackish tissue, forming a soft moist slough, which tends to extend so long as the disease is left to nature.

The treatment must be local and general. The principal indication is to combat the disease which is weakening the infant; hence tonics of various kinds—cinchona, bitters, beef-tea, wine, coffee, etc.—are to be placed in the first rank. The local treatment is no less important. Applications of lemon-juice, of powdered cinchona and camphor, spirit lotions, etc., may be sufficient. These, however, often fail; and the best means of arresting the gangrene is the application of iron at a white heat; the cauterisation ought to extend beyond the limits of the eschar. When this energetic remedy is successful, there is left a large eschar—a true burn of greater or less depth, and requiring the ordinary treatment of burns. Powder of cinchona, or of charcoal, with a little camphor, are important applications; lotions of aromatic wine or chlorinated water may be useful. Every possible care must be taken to prevent adhesion of the labia; the dressings should be carefully applied and frequently renewed.

5. *Syphilitic Vulvitis* is characterised by the presence of chancres or mucous pustules. It must be observed, that the mucous pustules observed between the labia majora and also at the anus are not always syphilitic, but are often produced by want of care and cleanliness; and yield to lead lotions, the application of nitrate of silver, and baths, without general treatment. When, on the contrary, the mucous patches resist these measures and are accompanied by true chancres or by syphilitic pemphigus, it is necessary not only to attend to the cleanliness of the patient, but to subject her to mercurial treatment. This affection, when met with in very young children, is hereditary, and frequently appears fifteen or twenty days after birth; in older children, from eight to ten years of age, it is acquired, being produced by the contact of individuals affected with syphilis.

In infants, M. Guersant has employed the following treatment with success. The child is placed daily in a bath containing some corrosive sublimate; and a few drops of Van Swieten's solution (a preparation of bichloride of mercury) are also given daily in a little syrup. If the mother be suckling, she must be subjected to general treatment. If the infant cannot be suckled by the mother, it must not be entrusted to a nurse, but must be fed by the bottle. In some cases, M. Guersant thinks, it is advantageous to give the child the milk of a goat which has

been subjected to mercurial friction; but it is of the greatest importance that the animal should live in the open air, so that its milk may be of the best quality.

Syphilitic children may also be fed with the milk recommended by Dr. Labourdetti, and brought daily into Paris. It is obtained from cows fed in the pastures of Normandy, to whom is given every day, before and after their return from pasture, a bolus of iodide of potassium. M. Guersant says that he has known the best results to follow the use of this milk, which he prescribes in cases of syphilis and scrofula in newly born children.

EXCISION OF THE TONGUE.

THE week before last we announced the fact that Mr. Syme had successfully removed the tongue. The following is the history of the case and the operation.

Some years ago I endeavoured on two occasions to afford relief from disease of the tongue, otherwise incurable, by cutting out the entire organ; but, as both cases terminated unfavourably, I felt no desire to repeat the experiment, and have repeatedly declined doing so under circumstances of a very urgent character.

In the early part of November last, Mr. W., aged 52, from Manchester, applied to me on account of a very formidable morbid condition, affecting his tongue. From its point to the root it was swollen and indurated, the surface being of a brown colour and roughly tuberculated, so as to resemble the back of a toad. It was also nearly quite immovable, and, from completely filling the mouth, not only prevented articulation, but rendered deglutition impossible with respect to solids and extremely difficult in regard to fluids. From the same state of matters, there was a most offensive fetor through mucus secreted by the unhealthy surface not being permitted to escape.

The patient informed me in writing that he had suffered from uneasiness in his tongue for many years, but that neither articulation nor deglutition was seriously affected until 1862, since which time he had been under medical treatment in London as well as Manchester without experiencing any benefit. As palliation seemed all that could be expected, I offered some suggestions with this view, and advised that no time should be lost in returning home. But soon after his arrival there I began to receive from the patient very painful letters, reporting aggravation of the symptoms, especially in regard to deglutition, so that death from starvation seemed imminent, and urgently desiring some means of relief. To these appeals I replied that the only effectual remedy was removal of the tongue, and that this could not be done without very serious danger to life, so that the operation promised nothing more than a chance of escape. This slight encouragement brought the patient back, and he arrived here on December 27th.

Being thus as it were compelled to make another trial of excision, I carefully considered all the circumstances concerned that might tend to interfere with its successful performance. Of these the one which most prominently presented itself was the prevention of voluntary deglutition that must result from depriving the os hyoides of the power by which it is drawn forwards. In the common cases of cut-throat, where a large transverse wound is made into the pharynx, although the suicide rarely accomplishes his object in the first instance, he still more rarely escapes the fatal effect of pulmonary inflammation induced by irritation propagated from the larynx; and I did not

forget that both the patients on whom I had performed the operation in question died from purulent effusion into the lungs. Instead, therefore, of cutting through all the muscles of the os hyoides, as had been done in the former cases, I resolved to retain the mylo-hyoid and genio-hyoid entire, and divide merely the attachments of the genio-hyoglossi. I also thought it would be better to perform the operation without chloroform, since the patient, instead of lying horizontally, might thus be seated on a chair, so as to let the blood run out of his mouth and not pass backwards into the pharynx.

The operation was performed on the 29th, with the assistance of Mr. Annandale, Dr. Sewell, and Mr. Cheyne, to the first of whom I am especially indebted for his able co-operation. Having extracted one of the front incisors, I cut through the middle of the lip and continued the incision down to the os hyoides, then sawed through the jaw in the same line, and, insinuating my finger under the tongue as a guide to the knife, divided the mucous lining of the mouth, together with the attachment of the genio-hyoglossi. While the two halves of the bone were held apart I dissected backwards and cut through the hyoglossi along with the mucous membrane covering them, so as to allow the tongue to be pulled forward and bring into view the situation of the lingual arteries, which were cut and tied, first on one side and then on the other. The process might now have been at once completed had I not feared that the epiglottis might be implicated in the disease, which extended beyond the reach of my finger, and thus suffer injury from the knife if used without a guide. I therefore cut away about two-thirds of the tongue, and then, being able to reach the os hyoides with my finger, retained it there while the remaining attachments were divided by the knife in my other hand close to the bone. Some small arterial branches having been tied, the edges of the wound were brought together and retained by silver sutures, except at the lowest part, where the ligatures were allowed to maintain a drain for the discharge of fluids from the cavity.

Next day I visited the patient, and finding him in all respects comfortable, inquired if he could swallow. In reply he pointed to a drinking-cup containing milk, and intimated that he wished it to be filled; then, placing the spout between his lips, while his head was bent backwards, he drank the whole without any cough or sputtering. Having seen this, I felt assured that the result would be satisfactory, and was not disappointed, as everything went on well afterwards. The only inconvenience experienced was from the edges of the jaw being occasionally displaced; but this was easily remedied by an ingenious contrivance of Mr. Wilson, the dentist, who, finding that a silver cap inclosing the teeth, was not sufficient for the purpose, fashioned a shield of gutta-percha, embracing the chin on each side, and secured to the metal plate by a wire.

Under an ample supply of nourishment by milk, soup, and soft solid food, there was a rapid return of strength, so that an improvement in this respect was almost daily observable, and before the end of three weeks the patient declared that he had never felt better in his life. He returned to Manchester on January 23rd.

Excision of the tongue has thus afforded complete relief in a case of the most formidable and distressing disease. How far the relief thus obtained may prove permanent, and how far it may admit of being extended to cases of a similar kind, are questions that can be determined only by experience. But the frequency of malignant growth affecting the tongue in an otherwise sound state of the system urgently requires the truth to be ascertained in regard to the value of a

remedial measure; and if the operation is now, as I trust it has been, freed from the chief danger attending its performance, facts sufficient for the purpose will probably ere long be accumulated.

R. PARTRIDGE, Esq., F.R.S., President, in the Chair.

ON ECZEMA OF THE EYELIDS, CONJUNCTIVA, AND CORNEA. BY FURNEAUX JORDAN, M.R.C.S., BIRMINGHAM.

[Communicated by E. H. SIEVEKING, M.D.]

MANY observers, and especially writers on diseases of the skin, have considered ophthalmia tarsi to be simply eczema of the lids. Dr. Mackenzie has pointed out that scrofulous, or as he terms it, phlyctenular ophthalmia, is frequently associated with eruptions on the skin. It is the object of this paper to show that not only ophthalmia tarsi is eczema of the lids, but that granular lids, a peculiar swelling of the sub-integumental connective tissue of the lids, lippitudo, strumous ophthalmia, certain forms of simple or catarrhal ophthalmia, keratitis and strumous keratitis, and certain ulcers on the cornea, are merely varieties of eczematous disease. Cases of extreme, firm, indolent, pale or pinkish swelling of the lids, occur occasionally, the only cause of which is eczema of the margins of the lids. The eczema may be very slight, or it may pass away quickly, and leave only the swelling behind. Unchecked eczema of the eyelids terminates in lippitudo just as persistent and progressive eczema of the cornea produces pannus. Both these conditions are analogous to the eczematously red, swollen, and moist condition of the skin which may persist for an indefinite period. Eczema of the conjunctiva presents many important features. The so-called strumous ophthalmia may be regarded as chronic eczema. The several stages of pimple, vesicle, ulcer, or thickened patch, admit of indisputable demonstration. In acute eczema of the conjunctiva, there is for a few days a uniform scarlet colour; then a crowd of vesicles, which soon pass away, and leave an irregular or patchy redness—each patch, however ill-defined, having a redder, thicker, and possibly ulcerated centre. These cases have a slight mucopurulent discharge, and are always tedious. If treated as eczema, they speedily recover. The so-called keratitis, or strumous keratitis, is eczema of the cornea. When vesicles, white patches (necessarily white because of the anatomical structure of the cornea), or ulcers occur on the cornea in conjunction with vesicles on the conjunctiva, the term scrofulous ophthalmia is commonly used. If the same pimples (necessarily fiat), vesicles, patches, or ulcers occur on the cornea alone, especially near its centre, the term keratitis is applied, notwithstanding the symptoms are similar, and notwithstanding that there is usually, if it be carefully sought for, evidence of eczema of the

lids or face, or ears or scalp. The characters of eczema of the cornea are quite as typical as they are of eczema elsewhere. The several varieties of eczema of the cornea, conjunctiva, and lids are combined in a great variety of modes. They are much more frequently combined than not, and very frequently indeed associated with cutaneous eczema in its favourite localities. Eczema is often limited to sites as small as the cornea. The treatment should be directed to eczema. Its chief features are non-stimulating diet and alkaline medicines, with a little iron added in most cases. If the lids are affected, as also in pannus, lippitudo, and granular lids, a little of any of the "eczema ointments" may be used, with the customary attention to details; if there be much photophobia, a little morphia may be given in the morning.

ON THE SUBCUTANEOUS INJECTION OF QUININE FOR THE CURE OF AGUE AND OTHER MARSH FEVERS.

BY P. H. DESVIGNES, M.R.C.S.

[Communicated by JOHN BIRKETT, Esq., Hon. Sec.]

The author had had large opportunities of testing the value of this remedy in the intermittent fevers which were so common in the district of Tuscan called the "Maremma." The use of quinine and arsenic, in the usual manner, having repeatedly failed, he resolved to try the subcutaneous injection of solutions of quinine. The solution he employed was a grain and a half in fifteen drops of water, acidulated with a drop of dilute nitric acid. With this he successfully cured several hundred cases.

OBSTETRICAL SOCIETY OF LONDON.

WEDNESDAY, JANUARY 4TH, 1865.

HENRY OLDHAM, M.D., President, in the Chair.

FIVE gentlemen were elected Fellows.

Communications. Dr. PLAYFAIR read a case of Extra-Uterine Fœtation, on which Dr. PRIESTLEY made some remarks.

Mr. WILLS, through Dr. GRAILY HEWITT, described the Mode of Birth of a Double Monster, and exhibited a photograph of the same.

Dr. PARSONS exhibited a specimen of Pulmonary Embolism, of the tubular kind, after ovariectomy; and described the case.

Dr. RICHARDSON entered at considerable length into the question of these fibrous deposits.

Mr. NAPPER read a case of Amputation of Arm during early Pregnancy.

ANNUAL MEETING.

The business of the annual meeting then commenced. The report of the auditors of the accounts of the treasurer for the year ending December 31st, 1864, was read; from which, it appeared that the balance in the hands of the treasurer is £262:6:5, and that during the year a sum of £181:10 was invested in Consols, in the name of the trustees of the society, making a total now invested in Consols of £731:10. The balance-sheet showed that the society had received during the year the sum of £469:7, as subscriptions from the fellows, and £40:9:6 from the sale of *Transactions*.

Mr. MITCHELL, in proposing the adoption of the report, congratulated the society on its financial prosperity. Mr. NICHOLS having seconded the resolution, it was carried unanimously.

The SECRETARY having read the modifications of the laws rendered necessary by the opening of the library, Dr. MEADOWS proposed their adoption. This, being seconded by Dr. HALL DAVIS, was unanimously adopted.

It was then announced that arrangements were

now completed for the lending of the books of the library to the fellows, at Mr. Hardwicke's, publisher, 192, Piccadilly.

Dr. PRIESTLEY moved the following resolution, which was seconded by the whole meeting—

"That the thanks of the society be and are hereby given to the President and officers of the society for their services during the past year. That they be particularly given to the retiring President, Dr. Oldham, for the able and efficient manner in which he had presided over the society; and also to Dr. Graily Hewitt, on his retiring from the office of Honorary Secretary, for his zealous aid rendered to the society from its commencement."

The list of donations to the library was then read.

The following gentlemen were then elected officers for the ensuing year:—*Hon. President:* Sir C. Locock, Bart., M.D. *President:* R. Barnes, M.D. *Vice-Presidents:* G. T. Gream, M.D.; R. Greenhalgh, M.D.; F. S. Haden, Esq.; R. Hardey, Esq. (Hull); T. H. Tanner, M.D.; J. G. Wilson, M.D. (Glasgow). *Treasurer:* Graily Hewitt, M.D. *Honorary Secretaries:* J. Braxton Hicks, M.D.; A. Meadows, M.D. *Honorary Librarian:* A. Meadows, M.D. *Other Members of Council:* J. Aveling, M.D. (Sheffield); C. Clay, M.D. (Manchester); J. H. Davis, M.D.; H. Gervis, M.D.; A. Hall, M.D. (Brighton); I. Harrison, Esq. (Reading); H. Madge, Esq.; J. T. Mitchell, Esq.; G. C. P. Murray, M.D.; E. Newton, Esq.; H. Oldham, M.D.; E. Ray, Esq.; S. Richards, M.D.; T. Skinner, M.D. (Liverpool); W. Tyler Smith, M.D.; F. Symonds, Esq. (Oxford); J. R. Traer, Esq.

ANNUAL ADDRESS. BY H. OLDHAM, M.D., PRESIDENT.

The PRESIDENT referred to the prosperity and activity of the Society, as shown by the balance-sheet, by the *Transactions*, and by the number of its Fellows, who now were to be found in Australia, New Zealand, India, and Canada. He lamented, however, the death of six Fellows during the past year. He congratulated the Society upon the formation of the Lending Library, which had long engaged the attention of the Council. The tone in which the discussions had been carried on in the Society was very satisfactory, although subjects had been brought before them upon which there had been strong diversity of opinion. Dr. Oldham pointed out that it was to the interest of the Society to continue to maintain this spirit unimpaired. He thought it desirable to establish a committee of two experts to report to the Society upon the results of any new line of practice which might prove of serious consequence to the patient. It was one of the duties of the Society, not only to bring forward new suggestions for improving practice, but, by the light of modern science, occasionally to revise the older rules and opinions; and he noticed, among other subjects, the advantages of the careful and intelligent investigation of the influence of the ergot of rye on the mother and fetus, and on the uterus in functional or organic diseases. He alluded to the possibility of improving the education of women as nurses to the lying-in room, by instructing them in public institutions to a competent knowledge of their duties, which would save a vast amount of the injury and misery inflicted by incompetent nurses. Referring to the revival, in a recent case, of a jury of matrons to decide upon the pregnancy of a condemned criminal, he hoped the Society would take an early opportunity of endeavouring to induce the legislature to alter this rule, and refer in future to obstetric practitioners. The President, in conclusion, expressed his warm acknowledgments for the assistance rendered him by the Honorary Secretaries; and thanked the Fellows for their support, which had rendered the performance of his office one

of the most agreeable recreations of his professional life.

Dr. TYLER SMITH proposed, and Dr. GREENHALGH seconded, a vote of thanks to the President for his valuable address, which was carried unanimously.

HARVEIAN SOCIETY OF LONDON.

THURSDAY, JANUARY 19TH, 1865.

J. LANGMORE, M.B., President, in the Chair.

Extraction of Cataract. Mr. J. Z. LAURENCE exhibited a case of Mooren's operation for the extraction of cataract. It was that of an old woman, 79 years of age. Mr. Laurence had first performed iridectomy, and then extracted by the downward section. The patient, with a proper glass, read the most minute type (No. 1 of Jäger). The case illustrated forcibly the great value of Mooren's operation; for it would have been difficult to have selected a more unfavourable case for any operation, and more especially for one in which reparative action has to take place in a non-vascular texture, like the cornea. The patient was very aged; she suffered from chronic bronchitis, and was very emaciated and feeble. During the progress of the case, she had nearly succumbed from a violent attack of diarrhoea; she had iritis, which had left the iris adherent to the anterior capsules in parts; the cornea was opaque at one part. Yet, in the face of this complication of untoward circumstances, the operation had been attended with the most brilliant result. Mr. Laurence stated he had now extracted about a dozen cataracts successively by Mooren's method without losing a single eye; and that, notwithstanding many of the cases presented as unfavourable circumstances as the case before the society. He felt convinced that many of his cases would have gone wrong had the flap extraction not been preceded by iridectomy. In answer to a question, as to how long a time the iridectomy should precede the extraction, Mr. Laurence stated that he waited until all irritation had gone off after the iridectomy, which was, on an average, about a month.

Favus. Dr. SQUIRE showed a photograph of favus.

Embolia of the Great Vessels of the Heart, and its Diagnosis. By W. STEWART, M.D. The author wished to draw the attention of the Society to the following cases, which, he hoped, would throw light on the diagnosis of embolia. Case I was that of a widow, who, enjoying perfect health, was suddenly seized with fainting, vomiting, cramps, and coldness. When seen by the author, she was in collapse, with general cyanosis of the surface. She died five hours afterwards. *Post mortem* examination showed general venous congestion, externally and internally; interlobular emphysema of both lungs, with pulmonary apoplexy. The cavities of the heart were full of black fluid blood. A large clot of partially decolorised fibrine was attached to the lining membrane of the heart, and filled up the orifice of the aorta so as completely to occlude it. The second case was that of a single woman, aged 49, who fell down suddenly and expired. For ten years, she had suffered from angina pectoris; but had been well previously to her death. There was cyanosis of the head, face, and neck. On *post mortem* examination, there was found to be general venous congestion externally and internally, pulmonary apoplexy, and emphysema. The heart was hypertrophied, dilated, and atheromatous, with softened valves. Its right cavities were full of dark fluid blood; and fibrinous clots existed in the pulmonary artery. Case III was that of a gentleman who died suddenly. Atheroma of the heart was

found; and a large clot filled the vena cava descendens and both subclavian veins. In the fourth case, a woman, aged 46, died suddenly, with great dyspnoea and cyanosis. No *post mortem* examination was allowed. In all of these cases, the cyanosis was of a deep purple hue; so deep as only to be seen in cases of strangulation by hanging or blueness from cholera. The clots of fibrine, in one case, were softened, and fat globules were seen on them. Dr. Stewart said that, if he were called to a patient evidently seized with extreme excitement of the nervous, vascular, and arterial systems, great anxiety of the countenance, with blueness of the surface coming on in apparent health, accompanied with fainting, vomiting, and exhaustion, without apparent cause, he would diagnose embolism of the great vessels of the heart.

Dr. HARE thought that the definition of the word embolism ought to be kept closely in view. It meant something thrown by the heart into the arteries and plugging them up. He thought that none of Dr. Stewart's cases fulfilled this definition, and consequently they were not embolism. All persons constantly engaged in *post mortem* examinations were accustomed to these fibrine plugs in the great vessels.

Dr. DRYSDALE said that Virchow had first pointed out that thrombus and embolism were probably the causes of pyæmia; and that, in rheumatism, the smaller vessels of the brain might be plugged up from the heart; but such large plugs as those mentioned by the author were not embolism, he thought; though cases were given where the femoral artery was occluded and dry gangrene ensued.

Mr. J. Z. LAURENCE said that embolism of the retinal vessels might be observed in some cases by the ophthalmoscope.

Mr. JAKINS related two cases of what he considered embolism of the heart occurring in soldiers who were invalided. In the second case, a soldier was found dead in his bed, with an empty laudanum bottle near him, and a large clot was found in the auriculo-ventricular opening extending into the great vessels, which he thought had caused death.

Dr. CLEVELAND considered this case to be probably one of poisoning by laudanum; and the plugs in the great vessels to be what was constantly met with in *post mortem* examinations.

Correspondence.

SYPHILISATION.

LETTER FROM PROFESSOR J. Y. SIMPSON, M.D.

SIR,—My son, whose report of two cases of tertiary syphilis cured by syphilisation was quoted by you in the JOURNAL for January 25th (p. 89), is abroad. In his stead, therefore, allow me a word or two in answer to Mr. Henry Lee's criticism on one of these cases, contained in the last number of your JOURNAL (February 4th, p. 128).

1. Mr. Lee (who never saw the gentleman I allude to, before his cure by syphilisation) states it as his "decided opinion that he had never suffered from syphilis at all." All the medical men who saw him when he was ill, entertained exactly the opposite opinion; and surely they had infinitely better means of forming a correct judgment. Dr. Rynd of Dublin, who attended the patient during the existence of the primary disease, declared the sore to be syphilitic; and Dr. Guthrie, Professor Miller, and Professor Boeck, who had him successively under their care after the tertiary symptoms broke out, never, I believe, had a single doubt as to the syphilitic cha-

racter of his malady. I never myself saw a more distinct and marked case of tertiary syphilis.

2. Mr. Lee argues that the absence of any recollected eruption in this case, and the lapse of some years between the primary and the tertiary affections, "lead to the inference that the patient's symptoms were not syphilitic." This argument seems to me inconceivably strange, coming from a gentleman in Mr. Lee's high position. Mr. Lee himself states, in his work on *Syphilis* (2nd edition, p. 268), that there is no well-marked natural division between the secondary and tertiary symptoms, "and, in fact, the so-called tertiary symptoms sometimes appear before the secondary." Mr. Acton (*Practical Treatise*, 2nd edition, p. 558) lays it down that occasionally no secondary symptoms whatever appear after the primary sore; but, after "a considerable lapse of time", in consequence of some exciting cause, as cold, etc., "tertiary symptoms all at once declare themselves". In his elaborate and masterly treatise on the *Pathology and Treatment of Venereal Diseases*, Dr. Bumstead of New York observes: "We meet with some instances in which syphilis appears to skip over its secondary, and manifest itself *only* in its primary and tertiary forms." (P. 632.) One of the greatest living authorities in surgery, Professor Gross of Philadelphia, remarks in regard to the phenomena of tertiary syphilis, that the average period of their evolution ranges "from six to eighteen months, although in very many instances they do not occur until a number of years after the appearance of chancre, or chancre and bubo. Thus I have repeatedly seen tertiary symptoms manifest themselves for the first time from twelve to eighteen years after the primary disease, the poison having lain all this time like a hidden spark in the economy." (*System of Surgery*, vol. i, p. 486.)

3. Evidently Mr. Lee is anxious to reject this case as a case of tertiary syphilis, merely—it appears to me—because it was completely cured by syphilisation. And, indeed, the recovery was one of the most wonderful that I ever witnessed. The patient left this country for Christiania in the most wrecked and wretched state of health, so helpless and hopeless that most of his friends were in despair of the possibility of his recovery. He came back in three months well and feeling well; and one of his first visits was to the racket court. But Mr. Lee maintains that the disease of which this patient was cured was not syphilis, but "Softening of the Bones". That syphilisation should cure syphilis is, according to some minds, a great paradox—though not in reality a greater than the cure of it by mercury, iodine, or sarsaparilla. Professor Boeck has now used syphilisation successfully in hundreds of cases, and he looks upon the cure of syphilis by syphilisation as one of the most certain and "mathematical" facts in the range of practical medicine. I have the pleasure of knowing Dr. Boeck personally, and I know how entirely and implicitly his facts and observations and statements can be trusted to. But I opine that, if Mr. Lee's allegations be true, Mr. Lee has made—perhaps unwittingly—a greater discovery in surgical therapeutics than the cure of syphilis by syphilisation; for, according to his letter, he believes that inoculations from suppurating or soft sores cured in this case what was formerly, I believe, deemed incurable—namely, "Softening of the Bones". If the cure of syphilis by syphilisation is a marvel, should not the cure of "Softening of the Bones" by syphilisation be regarded in surgical therapeutics as a still more marvellous marvel?

4. The "Softening of the Bones" which, according to Mr. Lee's pathological views, was the malady under which the patient was brought to the gates of

death, was marked, as he himself states, by disease of the bones of the legs, enlargement of the left clavicle (there being carious ulcers in each of these three parts); pieces of bone were discharged from the interior of the nose, and the frontal and parietal bones were enlarged. What species of "Softening of the Bones" is, may I ask, indicated by this combination? Is there any new osseous disease, or "Softening of the Bones", of which these are the symptoms? Is there any old disease of the bones, *except* syphilitic disease of them, which ever leads to such a combination of them as the above?

I am, etc., J. Y. SIMPSON.

Edinburgh, February 6th, 1865.

P.S. I shall forward a copy of Mr. Lee's letter to Professor Boeck, who, I have no doubt, will answer it better than I can. Allow me to add, that I happened to see in the country lately the gentleman whose case is the other instance of syphilisation reported by my son. This gentleman is in the enjoyment of the very best of health, and spoke, to my astonishment, quite distinctly. He showed me that the secret consisted in his having a flexible caoutchouc palate to replace the havoc made in his mouth, etc., by the syphilitic ulceration. He assured me that, since leaving Christiania, he has not suffered in any degree from the old syphilitic enemy that had formerly nearly destroyed him, before he was cured by syphilisation.

J. Y. S.

MEDICAL ERRORS.

LETTER FROM GEORGE JOHNSON, M.D.

SIR,—In the concluding paragraph of Dr. Barclay's last letter, we have a good illustration of his mode of reasoning. He and many others at St. George's Hospital were, for a time, misled by two remarkable recoveries after treatment by calomel; so he conscientiously believed that one or two remarkable recoveries misled me. Therefore, he "cannot feel that any apology is needed" for the sentence which I have twice quoted from his book, containing, as it does, a statement of which I complain as inaccurate and unjust. It appears, then, that a censor who takes upon himself to expose and to correct the errors of his professional brethren, so long as he gives utterance only to what he conscientiously believes, is under no especial obligation to inform himself accurately as to the facts of a case before he ventures to pass judgment and to publish his prejudgment to the world.

Dr. Barclay "evidently does not comprehend" that the repeated reference to my book which appears so much to displease him, is an appeal to published facts from his "conscientious" belief as to what the facts are.

I sincerely regret to learn that he has "failed to discover any logical proof of a single statement which the book contains." Will he pardon me if I venture to suggest that this failure is not necessarily or certainly the fault of the book?

Dr. Barclay gives us in his own book an example of what I presume he considers a logical proof of a statement. He says: "The idea of increasing the discharges from the bowels, is opposed to the fact that the thickened condition of the blood, following on the abstraction of the serum, is prejudicial to life. This, I think, has been *proved* by the wonderful efficacy of fluid injected into the veins in bringing back temporarily to life and consciousness patients who were in the last stage of collapse."

Now, I beg to offer a few words of comment on the experiment which, to the logical mind of Dr. Barclay, appears to prove that the worst symptoms of cholera

are due to the drain of liquid from the blood. During the cholera epidemic of the year 1832, the late Dr. Mackintosh of Edinburgh, with a marvellous confidence in the truth of this theory, injected the veins of no fewer than 156 patients, of whom 131 died. Fortunate would it have been for many of these unhappy victims of a pathological theory, if they had been left to the unaided efforts of nature. But was not the temporary relief, in most instances, wonderfully great? Unquestionably it was; and on a superficial view, this result would seem to afford strong support to the hypothesis, that the symptoms of collapse are mainly the result of thickening of the blood through loss of its liquid. I believe, however, that the true explanation of the phenomena has been missed, and that, rightly interpreted, the results of this remarkable experiment afford as little support to the hypothesis in question, as does the undoubted fact that many of the most extreme cases of collapse are those in which there has been the smallest loss of liquid; or, again, the fact that the symptoms of collapse have often been observed to pass away, while the loss of liquid by purging has continued unchecked; or yet, again, the fact that many a patient has begun to rally from extreme collapse under the influence of a copious venesection. Dr. Markham, who has so well shown the influence of venesection in relieving distressing symptoms which result from embarrassment of the circulation through the lungs, will find few better illustrations of the principle which he advocates, than is afforded by the well authenticated instances of great and immediate relief by venesection during the collapse of cholera. There is good reason to believe, that the hot saline injection into the veins and the operation of venesection have this effect in common—that they tend to facilitate the passage of the blood through the lungs, and thus to remove that embarrassment of the pulmonary circulation, which is the essential cause of choleraic collapse. For the details of this explanation, I must again, with an apology to Dr. Barclay, refer to another publication.

Dr. Barclay appears to be anxious to fix upon me the statement that cholera is cured by castor-oil; and he especially commends to my notice "the expression several times repeated—that a patient was cured by so many doses of castor-oil"; corresponding, as it does, exactly to the words "strictly curative."

Now I can sincerely declare that if such a statement does occur in my work, it is the result of inadvertence, and not a true expression of my opinion, as must be manifest from the whole tenor of my remarks on treatment. But, as Dr. Barclay appears not to have discovered the printer's substitution of one word for another in the twice repeated extract from his own work, it may be that he has misread mine. For, although I find that the reports of several of the cases by my clinical clerks terminate with the expressions "cured" or "discharged cured", I can nowhere find the expression which Dr. Barclay commends to my notice. If, however, he will refer me to the page where it is to be found, I will at once admit that, in this particular at least, I have without reason questioned his accuracy.

I beg once more to express my conviction that while, in the proper sense of the term, there is no cure for cholera, and probably never will be, the eliminative plan is the rational and the right principle of treatment—the only treatment which can claim to have been in any degree successful. I repeat, too, that this conviction is not an assumption based on "one or two remarkable recoveries"; but a legitimate induction from a careful study of the entire history of the disease; more especially of the pathology of collapse, and the influence of various and opposite modes of treatment. I am aware that, in maintain-

ing this opinion. I stand opposed to some men for whose learning and judgment I entertain the highest respect. Nevertheless, so confident am I as to the general truth of the doctrine, that I feel it a positive duty to advocate it, in the face of opposition, prejudice, and even misrepresentation.

I am, etc., GEORGE JOHNSON.

11, Savile Row, W., February 7th, 1865.

THE DISCUSSION ON FEVER AT THE LIVERPOOL MEDICAL INSTITUTION.

LETTER FROM A. B. STEELE, ESQ.

SIR,—In the report under the above heading, published in the JOURNAL on the 4th inst., inaccuracies are so redundant as to render portions of the debate almost unintelligible to any but those who were present at the meeting. The importance and interest of the subject will, perhaps, induce you to afford me the opportunity of attempting to explain particulars which the report has left somewhat obscure.

The author of the paper, in his reply, is represented to have said "that he considered children as exceedingly liable to attacks of typhus"; which clearly implies that he ignored the well ascertained fact that typhus, like other exanthemata, as a rule, rarely occurs more than once in the same individual. The correct reading of the statement is as follows. A previous speaker had expressed an opinion that children enjoyed comparative immunity from typhus contagion. The author, in simply expressing his doubts as to the correctness of this view, did not, as the report implies, contend for a special liability in the case of children, although he laid stress upon the important fact that children were frequently the conveyers of contagion from house to house.

The inconsistency of the following sentence is apparent. The author is said "to have taken an opportunity of showing Dr. Buchanan that typhus, in some instances of a *very malignant form*, was and had been raging in his district." In the original sketch of the epidemic, it was described as exceptionally mild, and far less fatal than usual.

Your reporter has evidently failed to catch the point of the statement. The author had dwelt upon the significant fact, that hospital mortality in typhus was much greater than home mortality; and, as this important conclusion rested mainly upon statistics taken from his own district, he referred to the fact that his figures, as well as the cases from which they were derived, had undergone the rigid scrutiny and investigation of the government inspector, as evidence of their probable accuracy. Although severe and fatal cases of typhus were met with in the district referred to, the author had seen no examples of typhus during the present epidemic to which the term "malignant" could with any propriety be applied.

The summary of the treatment adopted by the author—viz., "some of the worst cases had recovered by asking the friends of the patients to give them plenty of brandy—a request which was, generally speaking, readily responded to"—scarcely conveys the true sense of this division of the subject. It might be inferred that the patients depended upon their friends for the supply of stimulants, instead of obtaining them, as they do, through the judicious liberality of the parochial authorities; while the special point of the remarks is altogether lost.

During the discussion, the question of the com-

parative merits of hospital nursing and home nursing had been raised; and the author wished to show that, however deficient in other respects the friends of the poor might be in the requisite qualifications of efficient nurses, he had found that, where the importance of the regular administration of stimulants had been duly impressed upon them, they, as a rule, gave the quantity ordered to their sick friends, and did not, as has sometimes been insinuated, follow the tactics of the "Sairey Gamp" school, by appropriating the "drops of comfort" to their own use.

There are several questions of much interest bearing on the subject of the causation of typhus, which were not fully brought out during this long and interesting discussion, but which I hope, on a future occasion, to lay before your readers.

I am, etc., A. B. STEELE.

Liverpool, February 1865.

VENESECTOMY.

LETTER FROM THOMAS MARTIN, ESQ.

SIR,—I have been much pleased in the perusal of Dr. Markham's clinical lecture on Venesection; and we are all much indebted to him for its insertion in the JOURNAL.

I am a very old practitioner, having formerly exercised the profession, for more than half a century, in what I call "The Happy Valley"—the vale of Holmsdale and the hill region round about—which is not only eminently healthy, but, according to the mortuary returns of the Registrar-General, is the healthiest part of England. In this district, I have had a large practice; and have had to treat many hundred cases of inflammatory disease, a large proportion being those of the respiratory organs and of the heart.

If applied to timely, one bleeding would perhaps suffice; producing the requisite impression on the action of the heart and arteries. Syncope was not required; but the change from a quick and hard pulse to a soft one was required, from which moment the patient was safe, the symptoms were at once relieved, and a speedy convalescence ensued, unimportant as might be the subsequent medicinal treatment. Another moderate bleeding might be demanded, or perhaps a blister; but I had no anxiety as to the patient's recovery, if application for aid was not too long delayed. I consider that the neglect of the use of the lancet of late years has been unfortunate; and a great mistake has been made in not distinguishing between depression of strength and real debility, inducing the use of stimulants, and thereby increasing the disease.

On a retrospective view, after sixty-five years' residence at this place, I have no hesitation in confessing to having sometimes overbled patients; correcting my error by the administration of opium, and encouraged by the wise admonitions of Dr. Marshall Hall.

I shall now, so long as I am spared (aged 86), hope to live to hear of the exercise of a correct diagnosis, and a judicious and appropriate treatment, instead of the present blind devotion to a stimulant system in all cases of congestion as well as inflammation of important organs. In such a pleasant reflection, I shall bear in memory my grateful recollection of my great master, Dr. George Fordyce, in avoiding nostrum-mongering and "extremes in practice."

I am, etc., THOMAS MARTIN.

Reigate, February 5th, 1865.

THE MEDICAL ACT.

LETTER FROM J. G. PARSONS, M.D.

SIR,—Not being quite satisfied with any of the proposed emendations of the 40th clause of the Medical Act, I beg, after mature consideration, to propose the following.

On and after the day of , 1865, it shall not be lawful for any person to pretend to be a medical practitioner, or to take or use any name, title, or description, contained in Schedule E of this Act, unless holding one or more qualifications registered under this Act; and entitling him to the use of such name, title, or description; and every person so offending shall, upon summary conviction, for such offence forfeit or pay a sum of money not exceeding twenty pounds. Provided always that nothing contained in this section shall prevent the free use of any qualification entitling to registration under this Act, granted by any university, college, or body, in the United Kingdom.

SCHEDULE E.

1. Physician or Doctor.
2. Surgeon.
3. Apothecary or General Practitioner.
4. Medical or Surgical Practitioner.
5. Professor of Medicine or of Surgery.
6. Physician or Surgeon, in combination with other words.
7. Any qualification, or the initial letters of any qualification, contained in Schedule A of this Act.
8. Any description implying that he is registered under this Act.

OBSERVATIONS.

By throwing the prohibited titles into a schedule, the wording of the clause is rendered clear and concise.

It prohibits the use of any title, even by registered practitioners, which their qualifications do not confer.

It prevents unqualified persons from evading the law by such compound words as Surgeon-Dentist, Surgeon-Accoucheur, etc.

It does not interfere with the proper use of medical titles granted by any body in the *United Kingdom*, even though the holders should not be registered. If gentlemen omit to get their foreign qualifications registered, they must submit to the inconvenience.

I am, etc., JAMES GAGE PARSONS.

Bristol, February 6th, 1865.

DR. BROWN-SÉQUARD. During the last week, much interest has been excited in Dublin by the visit of Dr. Brown-Séquard to that city, and the performance of a very formidable operation under the advice of that gentleman. The operation—excision of a portion of one of the vertebrae in a case of partial dislocation of the spine from injury—was performed by Dr. Robert Macdonnell in Jervis Street Hospital. In view of the certainty of death as the only remaining alternative, it was determined to endeavour to relieve the symptoms of paralysis by operation. The vertebra, which was low down in the dorsal region, was, we believe, found to be twisted and compressing the chord, and portions of the lamina were removed. Up to the present time, we understand that a slight improvement in motive power, or in the incontinence of urine and feces, has resulted. On Friday, the 3rd instant, a lecture on the Pathology and Diagnosis of Diseases of the Nervous Centres was delivered by Dr. Brown-Séquard before the King and Queen's College of Physicians. (*Dublin Med. Press.*)

Medical News.

APOTHECARIES' HALL. On February 2nd, 1865, the following Licentiates were admitted:—

Hera, Tudor, Blomfield Street
Mahony, Arthur John, Charlwood Street West
Richardson, James Francis Hamilton, Down, Kent
Wilson, Moreton S. W., Mowsley, Leicestershire

At the same Court, the following passed the first examination:—

Crowe, George, University College Hospital
Willmott, Robert, Moseley, near Birmingham

APPOINTMENTS.

*BROADBENT, W. H., M.D., elected Assistant-Physician to St. Mary's Hospital.

*DAVIES, Redfern, Esq., elected Surgeon to the Free Surgical Cottage Hospital, Walsall.

ARMY.

MARLOW, Surgeon-Major B. W., M.D., 28th Foot, to be Staff-Surgeon-Major, vice J. H. Ross, M.B.

ROSS, Staff-Surgeon J. H., M.B., to be Surgeon 39th Foot, vice C. T. Abbott, M.D.

WILLIAMS, Staff-Surgeon T. R., M.B., to be Surgeon 28th Foot, vice B. W. Marlow, M.D.

ROYAL NAVY.

CUNNINGHAM, Chas. L., Esq., Assistant-Surgeon, to the *Liverpool*.

MEIKLEJOHN, John A. S., Esq., Surgeon, to the *Columbine*.

TRIMBLE, James, Esq., Assistant-Surgeon, to the *Britannia*.

VOLUNTEERS. (A.V.=Artillery Volunteers; R.V.= Rifle Volunteers):—

JOB, S., Esq., to be Assistant-Surgeon 1st Administrative Battalion Nottinghamshire R.V.

MORISON, J. W., M.D., to be Assistant-Surgeon 5th Fife-shire A.V.

PRITCHARD, W., Esq., to be Surgeon 1st Administrative Battalion Nottinghamshire R.V.

ROGERS, R. J., Esq., to be Assistant-Surgeon 1st Sussex A.V.

WILLIAMS, T. M., Esq., to be Assistant-Surgeon 1st Administrative Battalion Nottinghamshire R.V.

DEATHS.

COLEBOURNE, Robert, Esq., Surgeon, at Great Marlow, aged 66, on January 24.

CREED. On January 26th, at Greenwich, aged 3, Ada Mary, only surviving daughter of Thomas Creed, M.D.

DICE, James, Esq., Surgeon, at Wednesbury, aged 28, on Jan. 27.

HANSTYDE. On January 24th, at Clifton, Letitia, widow of the late Robert Handyside, Esq., Surgeon R.N.

MATLAND, James, M.D., Deputy Inspector-General of Hospitals, at Anglessea Gosport, aged 57, on January 23.

MASTEN, George B., Esq., Bengal Civil Service, at Gondah, Oude, aged 39, on December 6, 1864.

MULLAR. On January 20th, at Kilburn, Frances, wife of F. G. W. Mullar, M.D.

ORD. On January 22nd, at Streatham Hill, aged 32, Julia, wife of W. M. Ord, M.B.

WATSON, James, M.D., at Edinburgh, on January 23.

WHEELER. On January 27th, at Swindon, aged 34, Edward, second son of Daniel Wheeler, Esq., Surgeon, formerly of Reading.

WOLSTENHOLME. On February 4th, at Holywell, Ada Elizabeth, youngest daughter of *John H. Wolstenholme, Esq.

THE LATE MR. BELFOUR. The remains of this gentleman were interred on Saturday last in the cemetery of Hackney Old Church.

BEQUEST. By will John Arnold, of Great Barford, Bedfordshire, and of Aldersgate Street, druggist, leaves to the Bedford Infirmary, £100. His personality was sworn under £60,000.

THE LATE DR. H. FALCONER. It is contemplated to erect a memorial of the late Dr. Hugh Falconer, in the form of a marble bust, in the rooms of one of the learned societies of which he was so great an ornament. The following gentlemen have undertaken to receive subscriptions for this purpose:—George Busk, Esq., F.R.S., 15, Harley Street; John Percy, M.D., F.R.S., Museum of Practical Geology, Jernyn Street; Colin Macrae, Esq., Oriental Club; and Charles Murchison, M.D., 79, Wimpole Street, W.

FEVER IN LIVERPOOL. A short time ago, the Government sent down to Liverpool Dr. Buchanan, as a medical commissioner, to report upon the cause and spread of fever in Liverpool. A summary of his report has been read before the Liverpool Select Vestry. The report is very minute and exhaustive. The conclusion arrived at by Dr. Buchanan is, that drinking and overcrowding are the principal causes of the fever which has so long afflicted Liverpool.

AN APPEAL. The following appeal has been made through the *Times* by the Rev. T. L. Fellowes, of Brighton Rectory, Acle, Norwich. "The appeal was made on behalf of the children of the late Dr. Andrews, the rector of Portwick, in Norfolk. He was originally a physician, but he had subsequently a strong desire to engage in the work of the ministry, and was ordained by the Bishop of Cape Town, Dr. Gray, in 1848. He remained a missionary in Africa for ten years before he returned to England, six years ago. He had been four years curate of Portwick at the death of his rector in 1863, and the Earl of Rosebery, with whom he had no acquaintance, generously presented him to the living in consequence of the esteem entertained for him by his parishioners. He had held his preferment but a single year when he died, in 1864, aged 55, leaving seven orphan children with no inheritance whatever, and no relations who are capable of assisting them. They had the calamity some years ago to lose their mother. The good fortune of Dr. Andrews was so brief that it only afforded him time to incur the expenses of his new situation without reaping its advantages. His previous salary had never exceeded £100 a year, to which was added such precarious earnings as he could derive from taking pupils. His eldest son is at the Cape, and can obtain his own livelihood. His two eldest daughters, aged 22 and 18, will trust, in like manner, to their own exertions. There remain three boys, aged 15, 14, and 13, and one girl, aged eight. A sum of £450 has been raised already, mainly through the agency of the press, and I venture once more to ask your indulgence to assist us in procuring the £1,050 which is still required."

DR. HUGH FALCONER. On the 31st ult., there died in London a man of science who was little known to the public, but who had made a great reputation for himself in the various scientific societies of London. He died at the age of 55, and twenty of the most active of these years were spent in India in the service of the East India Company. It is this absence from England that has chiefly retarded his public reputation. During the few years in which he has been at home he quickly became known as the possessor of one of the most scientific intellects in England. His chief field of study was palæontology, but he was also favourably known as a student of botany, and indeed generally of natural history. His scientific memory was prodigious, and he had such stores of knowledge at command that men of science in London are just now speaking of his loss as if with him had perished a great treasure of information which is not likely to be soon amassed again. From this enormous knowledge of his great things were expected; but he was cautious to a fault; never liked to commit himself to an opinion until he was perfectly sure of it; and he has died in the fulness of his power, before his race was run. He was born at Forbes, in the north of Scotland; he studied successively at the Universities of Aberdeen and Edinburgh; and went out to India in 1830. His two official appointments there, in which he became best known, were those of superintendent of the Botanic Gardens at Suharunpore in succession to Dr. Royle, and afterwards of those at Calcutta. It was to information

supplied by him that we owe the cultivation of tea in the district of Assam. It was through his exertions, also, that the cinchona plant has been introduced into India. The South American supply of quinine threatened failure through bad management. He suggested the cultivation of the plant in India, and the result has been completely successful. But beyond this he made great discoveries of fossils in India, and the result of his researches, arranged by himself, is a splendid gallery of specimens in the British Museum, the like of which is not to be found in any other collection in the world. He has been one of the chief instigators and directors of the inquiries which have recently been raised as to the antiquity of man. Many of the facts bearing on the question, such as those connected with flint implements, have been discovered either by him or by friends whom he urged to this or that course of investigation. About ten years ago he returned from India with shattered health, and he has died before his time. All those who had any knowledge of him will deeply feel his loss.

SANITARY CONDITION OF WOOLWICH. At a meeting of the local Board of Health, held on the 24th ult., at Woolwich, a letter was read from Dr. Simon, F.R.S., requesting to be informed what steps had been taken by the Board to carry out the recommendations of Dr. Bristowe, who had been specially employed by the Privy Council to make an inspection of the town with reference to the frightful epidemic which recently prevailed. Dr. Bristowe, in his report, strongly recommended the advisability of connecting the sewage system of the district with the tall shaft at the steam factory department of the Dockyard, as the best available means of getting rid of the noxious gases and effluvia which escaped from the ordinary sewer traps; and it was now stated that the local board had applied to the Admiralty for permission to carry out the plan proposed, but that some objections had been made, which it was believed could be obviated, and the subject was still under the consideration of the Board of Admiralty. A reply to this effect was ordered to be forwarded to the Privy Council.

TESTIMONIAL TO DR. ANDERSON AND MR. BRACEY. Dr. Anderson having resigned his situation as resident medical officer of the Birmingham General Hospital; and Mr. C. J. Bracey, who has filled the situation of house-surgeon at the same institution for the last three years, having also vacated his office, the students of the Sydenham College and the General Hospital availed themselves of the opportunity of expressing their obligations to those gentlemen by presenting them with testimonials on the occasion of the separation of the connection that had existed between them. Accordingly about thirty of the students assembled at Nock's Hotel, Monday evening last, when both gentlemen were present. After tea had been served, Mr. Hickenbotham, a late student of the college and hospital, was called to the chair, and briefly mentioned the object for which they were assembled. Mr. W. N. Hiron, one of the hospital pupils, then presented to Dr. Anderson a handsome marble timepiece, which had been purchased by the pupils as a testimonial of the respect and esteem in which that gentleman was held by them. The timepiece bore the following inscription:—"Presented to Dr. Anderson, by the students of the Birmingham General Hospital, upon his resignation of the office of House-Physician to that Institution. January 23rd, 1865." One of the hospital pupils referred to the distinction Dr. Anderson had attained in the University of Edinburgh where he had enjoyed for a considerable period the advantage of the prac-

tical instruction of Mr. Syme, and to the fact that he had studied under the personal superintendence of Professor Virchow at Berlin. Mr. Hiron said that the regret the students would experience from Dr. Anderson's departure at any period was increased by the comparatively short time they had been permitted to enjoy his society, and more especially by the fact that Dr. Anderson was going to leave Birmingham entirely, to practise in another part of the country (Burton-on-Trent), so that really the separation was more complete than they at first anticipated: he assured Dr. Anderson that they deeply appreciated his very kind attention to their studies, and that he carried with him their most earnest good wishes for his future success. In expressing his acknowledgments, Dr. Anderson assured them that he should always look back with pleasure to the time he had spent amongst them. He was aware of his shortcomings, for which he had always experienced their kind indulgence, and for which he most heartily thanked them. With regard to his late colleague, Mr. Bracey, he could assure them that whatever amount of order had prevailed in the hospital was mainly due to that gentleman, who had been a warm and zealous friend, and in the highest sense of the word had proved himself an amiable and honourable gentleman. In conclusion he thanked them most heartily for their present, and bade them a kind, hearty, friendly, and a most reluctant farewell. Mr. Read, a student of Sydenham College, then presented Mr. Charles J. Bracey with a marble timepiece and a pair of side ornaments, tazzas. This timepiece bore the following inscription:—"Presented to Charles James Bracey, M.B., by the students of the Birmingham General Hospital, upon his resignation of the office of House-Surgeon to that Institution. January 23rd, 1865." Mr. C. J. Bracey, in replying, said that his connection with the General Hospital and Sydenham College had been one of very long duration; it had been his pleasure—as he had felt it was his duty—to direct their attention to the principal cases under treatment, and he said that if he had been able to facilitate their comprehension of disease he was amply repaid; he thanked them for their very kind and handsome present. A vote of thanks was afterwards passed to the chairman, on the motion of Mr. Alfred Bracey, and the remainder of the evening was spent in a very harmonious manner.

ACTION FOR THE RECOVERY OF FEES. TAMPLIN v. COSENS AND ANOTHER. This was an action against the executors of a gentleman of the bar to recover the fees in respect of attendance upon his daughter. The young lady had laboured under double lateral curvature of the spine; and in November 1861, her father took her to the plaintiff, and placed her under his care. Mr. Cosens paid him the usual fee of a guinea, and nothing was then or at any time said as to fees. The plaintiff, however, intimated that his process of cure would probably take a considerable time—at least six months, if not longer. This was in November 1861; and he continued to attend the lady until July 1863, when her father died, and the claim in the present action, of course, could not extend beyond that date; though, in point of fact, the plaintiff continued to attend her, and in the result succeeded in effecting a cure, so that she had perfectly recovered, and, indeed, had since married. The total number of visits came to 218, for which he charged at the rate of one guinea for each visit; and thus the amount of his claim, up to the father's death, came to the sum of £228.11. The executors, however, conceived that the deceased gentleman, whose income, it appeared, was limited, could not have intended to pay so much; and they, therefore,

only acknowledged the claim to the amount of £129.13. Surgeons were called for the plaintiff, and stated that one guinea a visit was the usual rate of charge; and he himself positively stated that he never charged less, although, in cases of poverty, he would sometimes, out of charity, remit his fees, and charge only for alternate visits. And although he was pressed as to whether it was usual to let the fees run on so long, he stated that it was not usual to ask for the fees so long as the case continued. The Solicitor-General said he did not think that, after this evidence, it would be becoming in him to keep the case up longer. The Lord Chief Justice said he quite concurred in that course. The case started with the payment of a fee of a guinea, and nothing had been said as to a reduction or abatement. In such a case, the medical attendant being a gentleman of high eminence, it could not be doubted that the charge was as stated, and if there were any reason, on account of the length of the case and the circumstances of the patient to ask some abatement, it was for the patient or the relatives to request it, and throw themselves upon the liberality of the medical man. A verdict was then taken for the plaintiff for £99.

Virchow and the Cellular Pathology. A correspondent from Berlin writes:—"Perhaps the most important thing I have to tell you is as to a recent change in Virchow's opinion regarding the cell theory. This change has been caused by the discoveries of Recklinghausen (Virchow's *Archives*, about a year ago) in the cornea. He has shown that the corneal cells have not special cell-walls, but are merely spaces between masses of intercellular substances. The nuclei in the angles he therefore considers *free*; and he says that many of them can move along the canaliculi from one angle to another. Moreover, he says that the interior of these canals is continuous with that of the lymphatics; you can inject the lymphatics from them; so that, according to him, the origin of the lymphatics is to be found in the canaliculi of the so-called connective-tissue corpuscles. Then he says that the corpuscles of tendon and connective tissue are merely spaces with contained nuclei—a view which, of course, is *not new* to an Edinburgh man. Virchow admits all this; he admits that the corneal corpuscles are not cells. He seems rather reluctant to admit that those of tendon and connective tissue are the same, but he does not deny it; and he told me personally that he *now did not regard a cell-wall as an "essential part of the cell,"* as stated in *Cellular Pathology*; but that a nucleus surrounded by a molecular blastema was sufficient to constitute a cell: then he says that the outer part of this cell-blastema consolidates and forms a cell-wall, as Beale has shown; and that this takes place in the amoeba when placed in fresh water. This, of course, is a great triumph for Goodsir, who long ago was cautious enough not to say that the cell-wall is always present. (*Edin. Med. Jour.*)

MEETING OF MEDICAL PRACTITIONERS IN THE EAST OF LONDON. In pursuance of a requisition, a meeting of medical practitioners was held at the Beaumont Institution on Thursday, the 2nd instant, for the purpose of considering the subjects of medical evidence at coroners' inquests and the appointment of medical coroners, and the necessity of establishing a fund for defraying the expenses of legal assistance in defending proceedings arising out of the profession.—Dr. Rose, of Mile End, was called to the chair.—After some preliminary discussion, a resolution was proposed, to the effect of condemning the present mode of taking medical evidence at inquests followed by the coroner for East Middlesex. The Chairman and several other gentlemen supported the

resolution, and complained that the coroner was in the habit of putting leading questions to witnesses in such a way as to prejudice the medical practitioners. It was also averred that he was supported in this by three well known members of the profession—Dr. James Edmunds, Mr. Gant, and Mr. Gay.—Dr. Edmunds denied the accuracy of the statement which had been made in respect to himself. He had certainly been referred to as an independent witness by the coroner in several important cases; but he challenged any one to mention a single instance where he had allowed his professional character or the just interests of his professional brother to suffer.—After a somewhat stormy discussion, Dr. Edmunds proposed the following amendment: "That any medical practitioner who may be instructed to make a *post mortem* examination in a case where another practitioner has attended at the time of death shall always do the best he can to give such practitioner an opportunity of being present." This was carried unanimously. Allusion having been made to a case in which Dr. Edmunds was said to have disregarded the principle laid down in his amendment, he explained that the deceased person had not been attended before death by the practitioners mentioned; but only for a short time by a homeopath, to whom he would not feel bound to extend professional courtesies. He did not think that gentlemen who had not seen the case during life, and who had made a *post mortem* examination without a coroner's order, had any right to expect a second examination to be deferred until they had been communicated with. He was willing, however, to forego his own personal opinion if the meeting should so decide. A resolution was next proposed for the purpose of establishing an East End Defence Fund, to provide standing counsel and a solicitor to watch over the interests of practitioners. This was warmly supported by the previous speakers.—Dr. Edmunds thought that a resolution of this sort should not be set forth without due consideration by a meeting purporting to represent a large section of the metropolitan profession. He questioned the policy both of the object itself and of the local and practical mode in which the meeting would be able to carry it out. His arguments against the existence of the fund itself are, curiously enough, almost precisely anticipated in last week's JOURNAL; and with respect to the mode of carrying it out, he showed that if such a fund were formed by the meeting, it would only assist and be assisted by a small section of the profession, and that the cost of organising it and investing the funds would be very considerable in proportion. He communicated to the meeting the organisation of the British Medical Association, consisting of nearly 3000 members in all ranks of the profession and all parts of the empire, who were placed in weekly communication by their JOURNAL, which was sent post-free for one guinea annually, while the membership of the local Branches cost only half-a-crown. He suggested that, if the meeting determined to establish a defence fund, it should put itself into communication with the Association, and affiliate itself thereto. Dr. Edmunds thought that a Medico-Ethical Association was what was really wanted. If such an association existed, the misunderstandings which arise between practitioners and patients would be adjusted according to the general voice of the profession; and any one who should afterwards revive them would be discountenanced by his professional brethren. For the purpose of taking the sense of the meeting upon these points, he moved the following amendment: "That a committee be appointed to consider these subjects and report thereon.—The amendment was carried unanimously; and Dr. Miller,

Dr. Rose, Mr. Thompson, Dr. D'Olier, Mr. Stevenson, Mr. Reilly, Dr. Swyer, Dr. Edmunds, and another gentleman, were appointed members of the committee. The meeting, notwithstanding that there had been a good deal of warm discussion, broke up in harmony.

ARTIFICIAL LIMBS. The present sanguinary war has proved a powerful stimulus to inventive talent; and in nothing more than that of artificial substitutes for mutilated limbs. We have noticed from year to year the gradual improvements introduced into this department of surgical appliance; and, while most of them are far superior to either French or English productions, yet one could not but feel there remained great room for more simplicity in the mechanism. We have recently witnessed the working properties of the artificial limbs of Messrs. Kimball and Lawrence. They are constructed from a material (vulcanised rubber) which is comparatively unaffected by either heat or cold. In the arm, the contrivance for communicating the required movements is exceedingly simple, durable, and effective, admitting of such a variety, freedom, and facility of motion, as to wonderfully approximate the functions of the natural extremity. A party present, who was wearing one of these limbs, played, with no small degree of skill, on the violin; tossed up his handkerchief, catching it as it fell; and exhibiting several other equally difficult feats. In the lower limb, there is the same simplicity observed in its construction. The articulation at the knee is at once original and ingenious, combining the properties of precise movement with durability in so eminent a degree that it would appear impossible for it to become disarranged. (*Phil. Med. and Surg. Rep.*)

SMALL-POX. Dr. Corrigan, on the 23rd ult., delivered a lecture at the Richmond Hospital, in which he made some statements with reference to the present prevalence of small-pox in Dublin. "I do not, in my whole hospital experience, remember that this terrible disease (small-pox) at any time prevailed to the extent which it does at present, for about one-fourth of our whole hospital accommodation in the Hardwicke Fever Hospital is occupied by cases of small-pox. We have at present in the hospital thirteen or fourteen cases. I perceive by the week's register that three deaths from small-pox have occurred within the city within the week—exactly the same number of deaths that occurred from fever. But this number of deaths gives us no indication whatever of the extent of the disease, and this is one of the defects in the Registry of Deaths Act, which I hope will be amended. When this Act was passing through the Houses of Parliament, the College of Physicians drew attention to this defect in the Act—a defect existing in England as well as here—namely, that the death register gives no idea whatever of the sanitary state of a country or a district. In the common fever of the country it is different. If there be ten deaths from fever, we may, without committing any error, infer that there are 100 cases of fever at the time, because the mortality in the ordinary fever is generally ten per cent. But in the disease before us there may be for three deaths 500 cases of small-pox. The evil we have now to dread, the spread of small-pox both in England and Ireland, is like a fire that is smouldering beneath us. Now, I don't wish to be an alarmist, but at the same time I should be wanting in my duty to the public, and to my position here, if I were not to look fairly in the face the fact that the disease is now spreading around us. It is, in my opinion, an epidemic far more to be dreaded than cholera. Its mortality is nearly as great. The mortality of small-pox is about 30 per cent.; the mortality of cholera is

about 40 per cent. The mortality in cholera terminates the whole mischief; those who recover, recover perfectly: those who die are gone. But in small-pox it is not so; the blood is poisoned, scrofula is generated, consumption follows, and an amazing number of cases of blindness are the result in small-pox of the pustule settling on the eyes; and last, though not least, is the disfigurement produced by it. So that, as regards the epidemic, small-pox is more to be dreaded even than the epidemic of cholera. The poor-law authorities are doing all in their power to meet it. They are doing all they can under the present Vaccination Act for Ireland, but the Vaccination Act is by no means sufficient to meet the evil."

POISONING FROM DIGITALIS. At Quebec three gentlemen, Messrs. Murney, Rankin, and Scott, lately at the drug store of Messrs. Sturton and Co., ordered a stimulating drink. Mr. Sturton, who is reputed one of the best chemists in the province, was absent; but his son made up the potions as ordered. Unfortunately, he mistook one bottle for another, and gave his patients a draught of digitalis instead of gentian. The party had no sooner left the store than the effect of the poison began to manifest itself. Each of them complained, on leaving the store, that their fingers and the extremities of their toes were affected alike; that a burning sensation, as if pierced by needles, was troubling them, but did not suspect for a moment that they had been poisoned. Although the distance from Mr. Sturton's to Russell's Hotel is scarcely one hundred yards, yet the deadly draught had such an effect that Mr. Murney fell twice from exhaustion, and immediately after entering the hotel his companion, Mr. Rankin, fell senseless on the table in the reading-room. They were immediately conveyed to their respective rooms and medical aid called in. Dr. Marsden and other physicians were in immediate attendance, and the stomach-pump with a free application of antidotes were used, yet they were found of no avail. Mr. Murney, after suffering for an hour and a half, expired, while his friends, Mr. Rankin and Mr. Scott, lay in a very low condition, their medical attendant, Dr. Marsden, remaining with them all night. Mr. Scott and Mr. Rankin are now out of danger. The coroner's inquest has resulted in a verdict of "Manslaughter" against Mr. Sturton, jun. (*Quebec Daily News*.)

NON-COMBATANT (?) SURGEONS. The medical staff is making for itself an imperishable record by its intelligence, endurance, and patriotism. Instances are not wanting where medical men have entirely laid aside their profession, and taken up that of active combatants. Thus the surgeon stationed at Fort Sumter, at the outbreak of the war, is now a brigadier-general in active service, and has been a prisoner in the hands of the enemy. A prominent physician of West Virginia was recently killed in an engagement in the Shenandoah Valley campaign, while acting as commanding officer of a regiment. We have heard of instances in severe battles, where the loss of officers has been great, of medical officers taking their place and leading troops in the charge. Some have lost their lives, and others have been wounded while attending to their duties in collecting and caring for the wounded on the battle-field. The duty often devolves upon us to record the fact that surgeons have been killed or wounded in battle. Another way in which surgeons have shown their heroism and earnest and patriotic devotion to duty has been by remaining with the wounded on the battle-field when the fortunes of the battle have been against their friends. A marked instance of this kind of heroism on the part of our surgeons occurred during the Seven Days' Battles before Richmond in 1862, when Dr.

Swinburne of New York, and a number of other surgeons, remained with the large field-hospital of wounded troops at Savage's Station after it had fallen within the enemy's lines, and were taken prisoners. Bravery on the part of army and navy surgeons, whether in or out of the line of strict duty, is the more commendable, as it has not the stimulus of hope of advancement. There is not a private in the army who may not by personal courage win for himself some substantial acknowledgment of appreciation from the government. Not so the surgeon. No matter what heroism he displays, his status is fixed; his promotion is not influenced thereby. It is right that it should be so, perhaps, as his office is not one in which personal bravery on the battle-field is expected, or even proper. His reward must consist in the consciousness of duty well performed; and his hope for promotion must be founded on a faithful, intelligent, and conscientious discharge of that duty. (*Phil. Med. and Surg. Rep.*)

OPERATION DAYS AT THE HOSPITALS.

MONDAY.....Metropolitan Free, 2 P.M.—St. Mark's for Fistula and other Diseases of the Rectum, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.
TUESDAY....Guy's, 1½ P.M.—Westminster, 2 P.M.—Royal London Ophthalmic, 11 A.M.
WEDNESDAY...St. Mary's, 1 P.M.—Middlesex, 1 P.M.—University College, 2 P.M.—London, 2 P.M.—Royal London Ophthalmic, 11 A.M.—St. Bartholomew's, 1.30 P.M.
THURSDAY....St. George's, 1 P.M.—Central London Ophthalmic, 1 P.M.—Great Northern, 2 P.M.—London Surgical Home, 2 P.M.—Royal Orthopædic, 2 P.M.—Royal London Ophthalmic, 11 A.M.
FRIDAY.....Westminster Ophthalmic, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.
SATURDAY....St. Thomas's, 1 P.M.—St. Bartholomew's, 1.30 P.M.—King's College, 1.30 P.M.—Charing Cross, 2 P.M.—Lock, Clinical Demonstration and Operations, 1 P.M.—Royal Free, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.

MEETINGS OF SOCIETIES DURING THE NEXT WEEK.

MONDAY. Royal College of Surgeons of England, 4 P.M. Professor Huxley, "On the Structure and Classification of the Mammalia."
TUESDAY. Royal Medical and Chirurgical Society. 8 P.M., Ballot. 8.30 P.M., Dr. Morell Mackenzie, "On Inhalation of Atomised Liquid in Chronic Disease of the Lungs"; Mr. J. W. Hulke, "Ichthyosis of the Tongue"; Dr. Hillier, "On Congenital Hydronephrosis."—Anthropological Society of London, 8 P.M.
WEDNESDAY. Royal College of Surgeons of England, 4 P.M. Professor Huxley, "On the Structure and Classification of the Mammalia."—Medical Society of London, 8.50 P.M. Mr. Henry Smith, Lettsomian Lectures on the Surgery of the Rectum. Lecture 11, "On Stricture, Cancer, and Polypus of the Rectum."
THURSDAY. Harveian Society of London, 8 P.M. Mr. J. Z. Lawrence, "On Certain Functional Diseases of the Retina"; and discussion continued on Dr. Drysdale's paper on Phthisis.
FRIDAY. Royal College of Surgeons of England, 4 P.M. Professor Huxley, "On the Structure and Classification of the Mammalia."

COMMUNICATIONS have been received from:—Mr. FURNEAUX JORDAN; Mr. R. W. COE; Dr. DURRANT; Mr. STONE; Dr. JOHN THOMPSON; Mr. J. W. IRVINE; Mr. W. J. TUBBS; Mr. REDFERN DAVIES; Dr. J. G. PARSONS; Mr. WM. PARKER; Mr. D. KENT JONES; Dr. MAYO; Dr. BRUSH; Mr. THOMAS MARTIN; Dr. JAMES RUSSELL; Mr. A. B. STEELE; Dr. H. D. SCHOLFIELD; Mr. HENRY LEE; Dr. CARR; Dr. J. Y. SIMPSON; THE HON. SECRETARIES OF THE ROYAL MEDICAL AND CHIRURGICAL SOCIETY; Dr. GEORGE JOHNSON; Mr. J. W. BLACK; Dr. THORBURN; THE HONORARY SECRETARY OF THE HARVEIAN SOCIETY; Dr. WATERS; Mr. JOHN H. WOLSTENHOLME; Dr. BEIGEL; Mr. J. GLOVER; Mr. AUGUSTIN PRICHARD; Dr. W. H. COLBORNE; Dr. W. MARSHALL; COLONEL WALMSLEY; and THE SECRETARY OF THE ROYAL COLLEGE OF SURGEONS OF EDINBURGH.

Clinical Records.

XIV.

CASES OF RESECTION OF JOINTS: WITH OBSERVATIONS.

BY

HENRY LEE, Esq., F.R.C.S.,

SURGEON TO ST. GEORGE'S HOSPITAL.

THE detailed notes of the following cases were furnished by Mr. Thomas Pick, the Surgical Registrar of St. George's Hospital. A few years ago, all the patients whose cases are here given would probably have suffered amputation of the affected parts; but they have all up to the present time, under the treatment adopted, preserved their limbs.

One of the cases affords an example of primary resection, of which there are very few cases upon record. The patient, in this instance, recovered with wonderfully slight disturbance, either local or general; and the parts around were left so little thickened, that the part was more moveable after his recovery than was desirable.

The director used in the fourth case is an instrument little known in England. It was lent to me by Mr. Samuel Wood of Shrewsbury, who, I believe, obtained it from Paris. It consists of a shaft slightly curved and grooved on its convex side (somewhat like an ordinary grooved staff), with a handle which may be bent towards the concave side of the instrument. It is passed behind the part which is to be sawn through, with its concave side next to the bone. It is then turned half round, so that the groove is brought in contact with the bone; the handle is then bent down out of the way, and the bone is divided upon the groove. Great security is thus afforded against wounding any of the soft structures round the joint by the saw, and the bone may, in consequence, be more rapidly sawn through. In ordinary cases, where the bones are disarticulated before they are divided, no such instrument is required. But, in cases where the bones cannot be easily separated, the operation is very much more easily performed by the aid of an instrument such as is now described.

In the fourth of the following cases, the bones were removed without being detached from each other, and their extremities were found united together by fibrous bands. Had an attempt been made, in this instance, to disarticulate the bones, the operation would have been rendered more tedious and difficult. The use of the instrument described rendered this stage of the operation unnecessary.

CASE I. Resection of Knee. Benjamin Bennett, aged 8, was admitted on April 14th, 1863, into Fitzwilliam Ward.

History. Three years previously, he fell out of a small hand-cart and struck his knee. He did not suffer in consequence for some weeks; but then began to complain of pain, which was after a time accompanied by swelling. He became an out-patient at the hospital; and in the spring of 1862 was sent down to the Convalescent Institution at Margate.

Whilst there, an abscess formed above the knee, which continued discharging ever since. He had suffered lately from starting and jumping of the limb at night. He had had no other scrofulous symptoms, and had no cough.

On admission, the left knee was much swollen, and had assumed a somewhat globular form, so that the various prominences of bone could hardly be distinguished; the ends of the bones appeared, however, to be thickened, more especially the internal condyle of the femur and the inner side of the head of the tibia. The swelling had a soft semi-elastic feel, except just below and to the inner side of the patella, where there was evident fluctuation. The knee was maintained in a semi-flexed position; and could not be straightened. On the outer side of the thigh, some inches above the joint, were the remains of an old sinus, from which thin sero-purulent fluid exuded. The two bones could be moved on each other from side to side, producing partial dislocation.

Operation. April 23rd. The patient having been put under the influence of chloroform, a transverse incision was made just below the patella, extending from one condyle to the other; the knee was then forcibly flexed and the patella dissected out; a section of bone was then removed from both the femur and the tibia, not, however, so much as to remove the whole epiphyses. The bone which was left appeared healthy. There was little hæmorrhage, no vessel requiring a ligature. The wound was brought together with silk sutures, and the leg put up in a Macintyre's splint, with a long side splint, and swung in a Salter's cradle.

On examining the parts removed, the synovial membrane was found to be thickened and the crucial ligaments destroyed; the cartilage covering the external condyle was completely gone; that over the internal condyle was eroded in patches; the cartilages of the patella and tibia were also somewhat ulcerated. There was a small collection of pus in the internal condyle; and the bones throughout were somewhat softened and infiltrated with red pulpy fluid.

Vespere. He was very restless, and complained of considerable pain. Pulse 90. No sickness. There was oozing from the wound. He was ordered to have ten minims of laudanum immediately.

April 24th. He slept well during the night, and did not appear in so much pain this morning. The tongue was covered with white fur. His bowels had not acted. Pulse 100, soft, and easily compressible. The wound looked remarkably quiet; the edges were in nice apposition; a little thin serum exuded from the wound. There was some swelling, but no redness; pain was produced by pressure. He was ordered to have beef-tea, eggs, and arrowroot.

April 25th. He had passed a very quiet night, and this morning seemed free from pain. Pulse 98, quiet; tongue clean. The bowels had not acted. Skin hot; appetite improved. The wound looked remarkably quiet; there was no inflammation, and the edges were in nice apposition.

April 26th. He did not sleep so well, and seemed restless. The tongue was furred white. Pulse 90. The wound looked quiet. There was a little pus escaping from one extremity of the wound. Two of the sutures were removed. He was ordered half a roast slice, and half a pint of porter; and three grains of compound rhubarb pill at night, if necessary.

April 28th. He seemed much better. Tongue clean; pulse quiet; bowels open; wound quiet. Two more of the sutures were removed.

May 1st. The wound was very quiet; a little laudable pus exuding from one or two points. Pulse quiet; tongue white. The digestive functions were rather disturbed; he had slight nausea and sickness.

May 3rd. The last suture was removed to-day. The boy appeared to suffer no pain, and the whole appearance of the part was healthy; there was a little healthy discharge.

May 16th. A large abscess had formed in the upper part of the thigh. This was opened. The original wound looked healthy; there was a little discharge from one or two points.

July 1st. There was a perfect union, and very little shortening. The wound was quite healed. He was discharged.

Dec. 22nd. He came to the hospital to show himself. He could walk and run with facility. The knee was ankylosed and slightly bent; the leg was about one inch shorter than the opposite one.

CASE II. *Resection of Elbow.* Kate Wood, aged 15, a dressmaker's assistant, was admitted May 15th, 1863, into Princes Ward.

History. Three months before admission, without assignable cause, she found she was unable to bend the elbow. At this time, there was little pain, but swelling soon supervened; and for the last fortnight there had been starting and jumping at night.

On admission, there was considerable swelling, the joint being of a conical form, the base directed upwards and corresponding with the joint, so that the swelling was principally connected with the bones of the forearm. There was evident fluctuation just below the internal condyle. It was the right elbow. She was a scrofulous looking girl. A free incision was made.

June 27th. Another abscess formed. There was pain on pressing the articular surfaces together. Her general health was worse. The abscess was opened. Quinine and acid, and wine, were ordered.

July 8th. She appeared weaker. She had considerable cough, was restless at night, and complained much of giddiness.

July 11th. The cough had increased, with frothy expectoration. Sonorous *râles* were heard over both lungs.

July 16th. There was less fever and cough.

July 21st. Almost all the chest-symptoms had disappeared. The arm was quieter. There was less swelling.

August 6th. Her general health was very much better. She complained of great pain in the arm; and there was considerable discharge.

August 27th. The patient having been put under the influence of chloroform, an *H*-incision was made down the back of the arm, and the ends of the bones removed. This was somewhat difficult owing to the immense infiltration and thickening around. The arm was put upon a short angular splint, and the edges brought together. On examining the parts removed, the synovial membrane covering the end of the humerus was found to be thick and pulpy. On the ulna, the cartilage was absorbed, and a small portion of the cancellous tissue exposed, on squeezing which a small quantity of pus exuded. There was a deposit of crude tubercle, of the size of a bean, in the cancellous tissue of the ulna, which had been cut through in the operation. The articular cartilage of the radius was gone, and the joint filled with pulpy semi-organised lymph.

August 28th. She had been very sick and feverish all night. Skin hot; tongue furred. There was no hæmorrhage.

Sept. 1st. The inner flap of skin had sloughed. There was immense purulent discharge.

Sept. 4th. The wound was rapidly filling up, all sloughing having stopped. The granulations were healthy, but pale. An abscess had formed, and burst on the outer side of the arm. Her face was pale;

tongue clean. She felt stronger since the operation. Pulse 132, weak. Red wash was applied.

Sept. 6th. Pulse 112, weak. She felt better, and slept well. She suffered much less pain. The discharge was less than it had been.

Sept. 10th. She seemed weak and thin, but her spirits were much better; she slept well, and enjoyed her food. The wound was filling in rapidly; at its bottom could be seen a portion of the lower end of the humerus, black and necrosed; in all other parts, the wound was covered with healthy granulations. The discharge was thin, but healthy.

Sept. 18th. The arm was now in good position, and the wound was filling in rapidly. There was still, however, a large hole to be filled up. Her general health was good, and she went out daily.

Sept. 28th. The arm continued to improve, and granulated freely. She had no pain.

Oct. 7th. Two or three spiculæ of bone had come away.

Oct. 13th. The splint was left off to-day. There appeared to be some amount of union and power in the limb. It could be raised to the mouth.

Oct. 19th. A fresh sinus had formed on the inner side of the arm.

Oct. 24th. The wound had all but filled up; there were two ulcers of about the size of florins, and there was still considerable thickening and two sinuses. She could raise her arm to the mouth, and place it behind the back. There was some loss of sensation in the parts supplied by the ulnar nerve. She was sent into the country.

Oct. 29th, 1864. She had free motion in every direction and very considerable power. There was one little sinus which was still discharging.

Jan. 1865. She can extend her arm to very nearly a right line, and put it to her mouth without difficulty. From its appearance when her elbow is covered, no one would know that any disease had existed. The discharge from the sinuses around the joint had now ceased.

CASE III. *Primary Resection of Elbow.* Thomas Offer, aged 13, schoolboy, was admitted on September 20th, 1864, into Fitzwilliam Ward.

History. He was standing by a gentleman who was shooting, when the gun burst, and a piece of the barrel struck him on the arm.

On admission, there was a lacerated wound passing transversely across the outer side of the elbow-joint, and leading into it. There was a fracture of the radius just below the tubercle, the fracture communicating with the wound, through which the head of the radius could be seen. There was considerable bruising of the muscles.

Operation. A longitudinal incision was made down the back of the joint, and the ends of the bone were dissected out and removed, as well as some of the bruised muscle. Three vessels required ligature. The wound was brought together with silver sutures, and the arm put at an obtuse angle on a splint. On examining the portion of the radius which was removed, it was found to be comminuted, and the periosteum torn off; the cartilage covering the ends of the bones was bruised and chipped off in places.

Sept. 21st. He slept well. Tongue clean; pulse 104, quiet; skin cool; no bleeding.

Sept. 23rd. There was a good deal of swelling of the arm, which looked red. One of the stitches was removed. He was ordered to have two ounces of port wine.

Sept. 24th. There was less swelling, and more discharge. Tongue clean; bowels open.

Sept. 26th. The swelling was subsiding. He had very little pain. There was a healthy discharge from the wound.

Sept. 23th. The wound looked very quiet. He had no pain.

Oct. 1st. The wound looked rather sloughy in one part; there was no pain. Tongue clean; pulse quiet.

Oct. 5th. The wound was quite clean, except at one sloughing spot.

Oct. 9th. The slough had all separated, and the wound was cicatrising. The granulations were exuberant; there was no pain; and his appetite was good.

Oct. 15th. The wound was very healthy; the granulations were still very high. There was no pain. Heath's splint was applied, and he was ordered to get up.

Oct. 23rd. The wound was closing rapidly. The limb had already considerable motion, without pain in the joint.

Nov. 5th. The wound was all but healed; there was very free motion.

Nov. 9th. The wound was quite healed. He could flex and extend the forearm; there was slight pronation and supination, but this caused pain. He was discharged.

CASE IV. Resection of Elbow. Walter Walder, aged 36, a draper's assistant, was admitted on August 17th, into Fitzwilliam Ward.

History. Two years and a half ago, an abscess formed on the right elbow, in consequence of his having struck it against a piece of wood. He had, however, been able to continue his ordinary occupation till eight months before admission. He was an in-patient in the spring; and after he went out, various abscesses formed, and one small piece of bone came away.

On admission, there was some fulness of the right elbow-joint, especially on the outer side over the head of the radius; on the inner side, there was a swelling, soft and fluctuating, apparently communicating with the joint. The motion of the joint was limited. There were numerous sinuses around the joint, principally on the outer side over the radius. On probing, they appeared to pass through the joint and to lead down to exposed bone. He suffered little pain. There was very great discharge.

Oct. 6th. *Operation.* A longitudinal incision four inches in length was made over the outer side of the arm, and a corresponding one over the inner side. These were joined by a transverse one over the olecranon. The upper flap was dissected back, and a curved director on a handle was passed round the humerus and the saw applied; the bones were then separated from the surrounding parts, and the ulna and radius sawn through. The wound was put up with silk sutures, and the arm placed on a turned splint.

On examination of the portions which were removed, there was found to be much gelatinous thickening of all the tissues around the joint, and the parts were filled with sinuses, one of which passed through the joint. The cartilages of the joint were eroded; that covering the anterior surface of the humerus was entirely gone, and the articular end of the bone was eroded; the cartilage covering the humerus was also gone, and the bone softened. The extremities of the bones were in some parts connected together by newly formed fibrous tissue.

Oct. 7th. He was very restless all night; there was no bleeding. Pulse 104; tongue furred.

Oct. 8th. He was very restless all night, from pain in the back; no pain in the arm. Pulse 100; tongue clean. The wound looked quiet.

Oct. 9th. He slept better. There was less pain in the back; and not much pain in the arm. The wound was gaping; a number of clots were breaking

down, and there was redness and swelling around. Pulse 112; tongue clean. He enjoyed his food.

Oct. 11th. The wound looked very much quieter and cleaner; all the clots had disappeared, and there were less swelling and redness around. He had no pain. Pulse 96.

From this time, he continued to improve. In a month, the wound had completely filled up and all but healed, and there was free motion in the joint.

On Nov. 30th, the wound was healed. He could flex and extend the joint to a certain extent without assistance. There was union between the ends of the bone; and he had a strong grasp. He was now discharged.

CASE V. Resection of Knee. Patrick Rekeil, aged 24, a groom, was admitted November 9th into Fitzwilliam Ward.

History. Four years previously a horse which he rode was constantly in the habit of lying down on his knee, which caused numbness in it for a time. A year afterwards shooting pains set in, and it gradually became weaker and he lost flesh. He had constantly been under medical treatment, and had the knee blistered and otherwise treated. He was an in-patient in July, when there was considerable thickening of all the tissues around the knee, but more especially over the inner tuberosity of the tibia; just above this, and to the lower and inner side of the patella, there was a hard, small, moveable substance to be felt. There appeared to be partial dislocation of the tibia, backwards and slightly outwards. There was pain on moving the joint and starting at night. After he went out, the pain and starting became much worse.

On re-admission, he was very much thinner, and seemed lower and weaker than he was in the summer. He had a slight cough, and there was slight dulness at the apex of the left lung, with tubular breathing. The joint was very much larger, from effusion both within and around it. The head of the tibia was also enlarged. Pain was very much increased; and he suffered very much from starting of the limb at night, which kept him constantly awake.

Operation. November 24th. A transverse incision was made over the front of the patella, and this bone first dissected out. The condyles of the femur were then separated from their attachments and removed. This was not done in the usual manner, but an oblique section was first made, removing the anterior part; a transverse one was then made, removing the under part; and lastly, a second oblique, removing the posterior part. The tibia was then exposed at its upper part, and a section made; this cut through an abscess surrounded by scrofulous matter in the head of the bone. In this abscess was a considerable portion of necrosed bone, detached from any surrounding structure. The sides of the cavity lined by scrofulous matter were carefully gouged out. The knee-joint was full of pus, which communicated with the abscess in the head of the tibia. Several small vessels required ligature. The bones were adapted and the incision brought together with silk sutures. The limb was put up in a MacIntyre's splint, with a long extension splint on the outside, and swung in a Salter's cradle. On examining the extremities of the bones, they were found to be entirely denuded of cartilage, and to be so much softened that they could be cut with a knife.

Nov. 23rd. *Vespere.* There had been slight oozing of blood. Skin hot; pulse 104; tongue white.

Nov. 24th. He had a good night; there was not much pain, but jumping of the limb. Tongue clean; skin cool; pulse 112. The wound was quite quiet: there was no more oozing.

Nov. 27th. He slept well, and had very little pain. Tongue clean; pulse quiet; skin cool. There was not the slightest tinge of redness about the wound. A little pus was oozing from one corner. Two sutures were removed.

Nov. 28th. He was seized with a severe attack of rheumatism, which continued for above a fortnight. There was very considerable discharge from the wound throughout the time that this continued, and for some time afterwards. He still remains under treatment (January 1865).

Original Communications.

FIVE CASES ILLUSTRATING THE ADVANCES OF MR. BARNARD HOLT'S PLAN OF TREATMENT IN STRICTURE OF THE URETHRA.

By WILLIAM NEWMAN, M.D. Lond., St. Martin's, Stamford.

CASE I. F. H., aged 53, had had stricture upwards of thirty years. He had been treated by dilatation up to Nos. 6 and 7 on more than one occasion; but the condition had always returned. For the past four or five years nothing had been done; and the symptoms were daily becoming more urgent. He passed urine in a twisted corkscrew stream, and with a good deal of forcing. He could rarely retain it in the day for more than two hours at a time; and had for years been obliged to rise and pass urine two or three times every night. Always, after micturition, he had the feeling that the bladder was not emptied.

Nov. 16th, 1863, 10 A.M. It was with some difficulty that I passed a No. 2 silver catheter into the bladder. On withdrawing this, I passed Mr. Holt's instrument through one long stricture anterior to the bulb, and then through a second, even more tight, further on in the canal. Urine at once came, *quittim*, through the hollow guide; and I split both strictures by passing down a No. 9 tube on the guide. This required some very positive force. There was very little bleeding. I introduced a No. 8 silver catheter easily enough, and drew off about six ounces of urine, and then sent the patient to bed.

He was ordered to have every four hours, a draught containing two grains of quinine with ten minims of tincture of opium.

1 P.M. There was a little smarting; no rigor. He had no wish as yet to pass urine.

2 P.M. He passed six ounces of urine with some blood, and two or three small moulded clots; there was some smarting.

8 P.M. He had passed urine twice again, and was quite comfortable.

Nov. 17th. He was very fairly well; was up twice last night. He had no need to pass urine oftener than once in four hours. I passed a No. 8 catheter with some little difficulty; the operation was followed by a little bleed.

Nov. 19th. He was very well; had lost the sense of weight and discomfort about the lower part of the abdomen, and felt now that the bladder was emptied by each act of micturition. I passed No. 8 very easily.

Nov. 21st. The patient maintained that the anterior stricture had not been thoroughly split. There was some distinct resistance to the stream of urine about three or four inches from the orifice; so, at his own request, I again passed the dilator and ran down

a No. 10 tube; it was followed by some little bleeding. I drew off six ounces or more of urine at once by No. 8 catheter.

Nov. 23rd. There had been no discomfort or trouble; and the stream of urine was decidedly improved. A No. 10 catheter passed very well. He was told to pass a No. 10 steel sound about twice a week.

Dec. 15th. He was not at all disturbed in the night; passed urine three or four times in the day without straining, and with thorough sensation of relief. He could pass No. 10 without difficulty. There was sometimes a little resistance at the seat of the front stricture.

Four months afterwards, this patient remained quite well.

CASE II. E. W., aged 45, nail-maker, had had stricture for the past ten years, consequent on gonorrhoea. He had been once under surgical care for some months, and a No. 10 catheter was reached after very many introductions; but the condition returned, and he was now as bad as ever. He was obliged to get up three or four times every night, and had much straining to get rid even of a small quantity of urine. He was obliged to make water every two or three hours through the day.

Jan. 5th, 1864. I could not succeed, even after employing the warm bath and giving some opium, in passing No. 2 silver catheter through the stricture. The urethra was riddled with false passages; and into one of these and for some distance, rather on the left side, the point of the catheter constantly slipped.

Jan. 6th. After some little time I managed to pass the dilator through one stricture anterior to the bulb; and by this the instrument was so closely gripped that I could not move it onwards, and had difficulty in even partially withdrawing it. Under these circumstances, and guided by a case recorded in Mr. Holt's book *On Immediate Treatment of Stricture of the Urethra* (2nd Edition, Pp. 108-109), I did not hesitate to split the stricture by passing down on the guide No. 9 tube; but not even then could I carry on the dilator in the bladder through a second very evident and tight stricture. I sent the man to bed, and gave him some quinine and opium.

Jan. 7th. He declared himself to be in some measure relieved by the operation. He was not up once in the night to pass urine; this had not been the case before for years.

Jan. 11th. Yesterday and to-day, I was able to pass a No. 2 solid steel sound fairly over the site of the first, and also through the second stricture, into the bladder. The calls to pass urine were not so frequent; and the stream was rather larger than he had lately found it to be. He had had no rigors, nor local suffering.

Jan. 13th. I passed No. 3 catheter, and on its withdrawal, No. 4 steel sound, fairly into the bladder.

Jan. 14th. I introduced Mr. Holt's instrument, and split both strictures thoroughly by running down between the blades a No. 10 tube. I withdrew the dilator, and then passed No. 8 silver catheter; but the eye was soon blocked with clot, and urine would not flow through it. When the catheter was removed, the patient, unable to restrain the desire, passed *immediately* about three ounces of urine with some quantity of blood; and about twenty minutes later (after I had left the room), he passed eight ounces more. He was ordered to take the quinine and opium as usual.

Jan. 15th. He said he was very well; had not had any rigor, and did not pass urine very frequently. He was not disturbed once in the night.

Jan. 16th. I passed readily into the bladder a No. 8 steel sound.

Jan. 19th. He passed urine about three times a

day in very fair stream—clear of his person; and was not disturbed in the night. I passed No. 10 catheter readily enough.

Jan. 23rd. He went home; and was ordered to pass No. 10 catheter twice a week.

Feb. 22nd. I had this report by letter:—"I never was better in my life; make a large stream of water, and can keep it all night without disturbing me at all. I make water three or four times a day, and can pass the instrument as often as I want it."

In August, I heard that he was and had remained thoroughly well.

CASE III. J. C., a shoemaker, aged 42, had gonorrhoea nearly twenty years ago, twice over. For the last six years he had had excessive trouble in micturition; was obliged to get out of bed three or four times every night, and passed urine almost every hour throughout the day. The urine dribbled away in a very small stream. He was a worn, thin, haggard man. No instrument had ever been passed fairly into the bladder.

Jan. 13th, 1864. After some trouble I passed No. 1 solid sound into the bladder, through one long and tight stricture beyond the bulb.

Jan. 15th. A No. 3 solid sound was passed through the stricture.

Jan. 16th. He passed urine an hour before I saw him. I succeeded in passing No. 3 silver catheter into the bladder, and drew off fully twelve ounces of turbid and high coloured urine. Having tied the catheter in, I left him for the night.

Jan. 17th, 4 A.M. The catheter slipped out, and thereupon he passed a quantity of urine in a larger stream than he had done for years.

9 A.M. I introduced the catheter again, and tied it in more securely.

9 P.M. I withdrew the catheter, and passed easily enough Mr. Holt's instrument, splitting the stricture thoroughly with No. 10 tube; there was rather free hæmorrhage afterwards. I emptied the bladder by passing No. 8 catheter. He was ordered to take quinine and opium.

Jan. 19th. He slept without waking from 10 P.M. to 6 A.M. this morning. He had not had so long a sleep for years. There was no pain, and no shivering. On waking, he passed urine in some quantity, and with little smarting.

Jan. 20th. I passed No. 9 steel sound; some little hæmorrhage followed its withdrawal. No subsequent trouble occurred, and on February 25th, I had this report from a surgeon near his home:—"J. C. passes No. 9 easily. He does not need to make water more frequently than other people."

In the summer I saw him again; he was looking far better; had gained a stone in weight, and had no trouble whatever in making water. The instrument (No. 9) was passed at intervals by himself very easily.

CASE IV. J. L., aged 40, had had stricture for eight or ten years back, but the symptoms had not until lately been very urgent; he had had once or twice almost complete retention of urine, and on these occasions ordinary means with the warm bath, etc., had relieved him. No instrument could then be passed into the bladder.

I first saw him in September 1864, and in some few days succeeded in passing a No. 2 catheter into the bladder, and emptying it of six or eight ounces of residual urine. There was a tight stricture anterior to the bulb, and through this in the first instance, I could only succeed in passing a very fine rather long probe. A very smart attack of stricture-fever and general constitutional disturbance followed the introduction of the catheter, so for some days he was left quite alone.

Oct. 10th. I succeeded in passing No. 2 catheter through the stricture; but, warned by prior disturbance, I did not carry it on into the bladder.

Oct. 12th, 9 A.M. The instrument (Mr. Holt's) was passed after a little trouble through the stricture; urine flowed through the canal of the guide, so I split the stricture at once with No. 10 tube. To do this effectually a good deal of force was needed. Ten ounces of clear urine were withdrawn at once by the No. 8 silver catheter. Quinine was given as usual.

1 P.M. He felt very well; had no shivering. I passed No. 8 catheter; six ounces of urine were withdrawn.

8 P.M. I passed No. 8 catheter. He was very well.

Oct. 13th, 8 A.M. He had slept very fairly well; he had no great desire to pass urine. I passed No. 8 catheter. He passed urine afterwards twice during the day in a very fair stream, and with very little smarting.

Oct. 16th. I passed No. 9 solid steel sound very readily; and he could also pass it for himself. He went home to-day, with full directions as to the use of the sound.

Nov. 4th. He came to see me, and reported himself quite well.

Jan. 7th, 1865. I met him accidentally; he had had no trouble whatever; passed urine as well as ever, and continued to introduce the instrument for himself once a week.

CASE V. *Stricture of Urethra Twenty Years; Absolute Retention; Puncture of Bladder per Rectum; Subsequent Splitting of Stricture.* H. S., aged 40, looking much older, thin and haggard, came to me with great trouble in micturition on October 11th, 1864. He had had stricture for twenty years; it was treated eight years ago, and for a time successfully, by dilatation; but he was now constantly wanting to pass urine. He was often up in the night, and could only void urine in a very irregular small stream or *guttatim*.

For the next week, I made several attempts to introduce an instrument (No. 1) through a very tight stricture in the membranous part of the urethra, and could not succeed. Then suddenly, after two nights of hard work and exposure at a cattle-fair, he found himself quite unable to pass urine.

Nov. 18th. I could not, with or without chloroform, introduce an instrument into the bladder. Opium in full doses and warm baths were of no avail; and the bladder was distended up to the umbilicus.

At 9 P.M., after consultation with a surgical friend, I punctured the bladder *per rectum* with the usual long trocar and cannula. More than three pints of urine were caught, and some escaped into the bed. I then tied the cannula in.

Nov. 19th, 11 A.M. Pulse 84. He was very comfortable; had had some sleep. Urine ran away very well. He had had no pain; there was no constitutional disturbance.

9 P.M. He was very well; was rather cramped from lying on his back, but had no pain. A good quantity of urine had come away. Pulse 70; no feverishness; no headache.

Nov. 20th. He complained sadly of being wet; and the skin of the back and hips was beginning to look red from soaking with urine; I therefore contrived this plan. I plugged the cannula with a piece of a No. 8 gum-elastic catheter, and on this drew the end of some small bore (one-sixth of an inch) India-rubber tubing, so that through the tubing, two feet or more long, all the urine was carried into a basin placed on the floor at the side of the bed; then, to prevent the flattening of the tube as it ran under the left thigh, I got a common brick circular drain-tile, wrapped this in flannel, and placed it under the left thigh,

which was just slightly bent. Through the canal of the drain-tile, I then carried the piece of India-rubber tubing to the receptacle on the floor.

Nov. 21st. The arrangement answered admirably. The man was very well; he slept, took food, and had no complaint.

Nov. 22nd, 4 P.M. He complained to-day of soreness about the abdomen. There was resonance down to the upper edge of the os pubis, but pressure made him flinch; so I thought it best to withdraw the cannula (it had been in the bladder now four days less five hours), and left him without attempting to pass any instrument *per urethram*.

Nov. 23rd. I failed in an attempt to pass a Thompson's probe-pointed catheter through the stricture. About eight ounces of urine had run away in drops, or in a small stream, *per urethram*; and there was more than a suspicion, almost a certainty, of some leakage *per rectum*. The bladder was slightly distended; there was a line of dulness above the pubes. He felt very well in health.

Through the next week, he remained much in the same condition. Most of the urine, I feel sure, escaped through the fistulous opening into the rectum, there collecting until he was obliged to empty the bowel. Some urine, however, ran through the urethra; but, whether from actual paralysis of the bladder, or from the feeling that it would escape *per rectum* if any effort was made, he was not able to use any force in passing urine.

Dec. 1st. I succeeded in passing a probe-pointed catheter (No. 1) fairly into the bladder, and tied it in for the night.

Dec. 2nd, 4 P.M. I removed the catheter, and substituted Mr. Holt's instrument, splitting the stricture thoroughly with No. 10 tube. I emptied the bladder with a No. 8 silver catheter. Four ounces of urine were contained therein.

9.30 P.M. I drew off sixteen ounces of urine with a No. 8 catheter.

Dec. 3rd. I emptied the bladder twice in the day; there was no escape *per rectum* as yet. He had no shivering; no trouble.

Dec. 4th, 7.30 A.M. He tried to pass urine *per urethram*, and could not do so; but more than ten ounces at once escaped *per rectum* (this I verified by personal observation of the urine passed). Some hours afterwards, therefore, I emptied the bladder by a gum-elastic catheter, and tied it in; and, so as to ensure, if possible, the thorough healing of the recto-vesical fistula, I directed him to empty the bladder every two or three hours.

It is not necessary to weary the reader with further daily reports. The gum-elastic catheter was retained in the bladder (daily changed and washed) for eight or ten days. The man remained quite comfortable; but the loss of power over the muscular coat of the bladder was made evident by his complete inability to influence or accelerate the stream through the catheter.

I then taught him to pass the catheter three times daily for himself; and found that to ensure his doing this easily, it was only necessary to give the catheter rather a large curve, so as to keep it along the smooth and newly formed bottom of the canal, instead of allowing the point to catch on some still existing roughnesses on the upper part or roof of the urethra. I had personally no trouble in passing No. 10 or No. 11 steel sound; the passage was not perfectly smooth or normal, but still the instrument travelled very well.

An attack of orchitis (left side), due apparently to exposure, delayed the patient's discharge; but he recovered from this, and will soon go to work.

Jan. 24th. I saw him to-day. He was very com-

fortable and very grateful; said that he was slowly regaining a little power over the bladder; and that three times each day, morning, noon, and night, he was able to pass unaided from three to four ounces of urine. Then, also, three times a day, and directly after his own effort, he passed a catheter and emptied the bladder thoroughly. There was no leakage *per rectum*; and no discomfort whatever. The man looked well, and had gained weight.

REMARKS. I have thus given the salient points in the successful treatment of five cases of urethral stricture by the use of Mr. Holt's instrument; and I shall be very glad if the publication may conduce in the slightest degree to a more extended employment of means at once so simple and so satisfactory.

The first four cases speak for themselves. Not one manifested any unfavourable symptom; and the relief in all has been so far complete. Rigors were not noted in any one instance—not even in Case II, where, from the first, the patient passed urine *sponte* over the freshly torn surfaces. Still I believe that plan to be the best, which has dictated the removal of the urine by the catheter for the first twelve hours after the operation. All contact of urine with the recent wound is thus for a certain time prevented; and the surfaces will probably have acquired an efficient coating of plastic material before the highly irritating fluid can pass over them.

It may not, wilfully to misapply the term, be very far from the truth to assert that the absence of ill results, after the splitting has been fairly accomplished, is due to the operation being *practically subcutaneous*. To the wounded tissues no access of external air is possible. Their ordinary distance, at least some inches from the external outlet; the pendulous condition of the organ; and the constant apposition of the walls of the urethral canal—all favour this condition, and lend some reason to a proffered explanation.

I believe it a manifest advantage, that the dilator should not be employed to examine the canal in the first instance. It would seem better that solid steel sounds up to No. 3 or No. 4 should be employed to open up a channel through the strictured part, and so to pave the way for the larger instrument. They are to be preferred, I think, on several grounds, to hollow catheters, though rather more time is needed in the preparatory treatment when solid instruments are used.

Not improbably, however, it may be found, as I experienced in Case v, that Mr. Thompson's probe-pointed catheter will aid in the earlier stages. It may be used where No. 2, and often where No. 1, ordinary catheter can pass; and, once introduced, some twelve hours' retention will so far dilate the strictured part as to favour the easier passage of Mr. Holt's instrument.

Case v is exceptional in several points. It affords a fair illustration of the ease with which the bladder may be punctured *per rectum*, and of the relief so to be obtained. Very probably some of my readers may believe that a catheter ought to have been passed into the bladder; and I willingly concede that, in abler hands, this might have been successfully done; yet

"Non cuius homini contingit adire Corinthum."

And the puncture of his bladder certainly saved the patient from an impending and not very distant death. The cannula was retained between three or four days with no local discomfort worth mention, and with not more than the suspicion of vesical irritation. The subsequent escape of urine *per rectum* was decided; but the expedient of keeping the bladder almost empty allowed thorough rest, and consequent

repair of the punctured wound. In any similar case, I believe that the adoption of my plan of conducting the urine away from the person would add materially to the comfort of the patient.

I have suggested to Mr. Coxeter of Grafton Street that, for this purpose, it would be well to prolong the cannula one-half or three-quarters of an inch beyond the shield; and upon this projecting part, clear of all possible interference with tapes or fastenings, the India-rubber tubing might readily be slipped after the cannula has been secured in the bladder.

It would seem very doubtful if this poor fellow will ever recover power over his bladder so as to dispense with his catheter. The stretching of the viscus from excessive distension must have been very great. He has taken, as yet with little absolute good, muriate of iron, strychnine, etc. Yet, with reference especially to the heading of my paper, I may be allowed to compare this man's present condition with the state in which he was three or four months ago. He has now, it is true, to pass a catheter three times a day; but this is a small evil, compared with his continual and painful attempts at micturition, disturbed nights, constant abdominal discomfort, and the chance of absolute retention daily hanging over him—to say nothing of the ultimate organic changes which would almost certainly have followed in the bladder and kidneys.

The operation of splitting urethral stricture is even yet *sub judice*; but as a simple and facile mode of ensuring a permanent benefit, at a minimum risk to the patient, I believe it deserving of more extended trial.

The instrument would, in my opinion, be made even more useful, if its stem were graduated in inches and half-inches. Valuable information as to the seat and length of the strictured part might thus be readily obtained by the operating surgeon.

REMARKS ON VENESECTION IN INFLAMMATION.

By WILLIAM MARSHALL, M.D., Mortlake.

IN the JOURNAL of February 4th, is a report of a most excellent clinical lecture by Dr. Markham, shewing the great and immediate beneficial effects of venesection in two cases of inflammatory diseases of the lungs. In my hands, in two or three similar cases, the same unmistakable and immediate benefit has resulted from it; and I am satisfied that this benefit is due in a great measure "to the freedom of action; the relief given by it to the play of the other (the uninflamed) parts of the lungs and the engorged heart; of the organs or parts, in fact, which have become secondarily engorged—i.e., impeded in action in consequence of the inflammation."

But has bleeding no other action upon inflammation? Does it never "arrest, nor directly alter, the condition of the inflammatory process? I think it does; and would submit the following cases as evidence in favour of such an action.

CASE I. J. S., a strong, robust man, aged 59, a night watchman at a railway-station, was found, at 2 o'clock A.M., insensible, lying on the railway below a bridge, from which he had evidently fallen, and alighted on his head. His head and face were swollen and bruised to a great extent; so much so, that it was impossible to ascertain accurately whether the skull were fractured or not. He was semi-comatose. About 10 A.M., he became restless, throwing himself about and muttering. Ice was applied to the scalp, and active purgatives administered. Towards the afternoon, phrenitis had unmistakeably set in. He

was violently delirious; the pupils were contracted; the eyes were intolerant of light and the ears of sound; the skin was hot; and the pulse was rapid, full, and bounding. Leeches were applied to the scalp, and he was bled from the arm; to what extent I cannot say, as the violence of his struggles rendered it impossible to measure the quantity; blood, however, was allowed to flow until he showed symptoms of fainting. The change for the better was most marked and immediate. He became comparatively quiet; the intolerance of light and sound were greatly diminished; and the pulse, though still rapid, was soft. Towards evening, the delirium returned, and the pulse rose. I removed the bandages from the arm, and allowed eight ounces of blood to flow away, with the same happy result. Next day, he was greatly better; the heat of the skin and the intolerance of light and sound were gone; the pulse was but little affected; and there was scarcely any delirium. From this time, the patient gradually recovered; but was for months subject to hallucinations. As the swelling went down, an extensive fracture of the skull was found, extending from the outer angle of the right eye obliquely across the top of the head, ending about three inches behind the left ear. One edge of the fracture could be distinctly felt and even seen to be raised above the other; and his head had a curiously twisted appearance.

CASE II. A. M., a strong healthy woman, aged 24, was struck violently with a hoe over the junction of the left parietal and frontal bones; the result was a compound depressed fracture. The depressed bone was raised. The membranes seemed uninjured. Everything apparently went on well for forty-eight hours. Symptoms of phrenitis then showed themselves, and rapidly increased in intensity. The skin became hot, the pulse full and bounding; delirium was constant and violent; intolerance of light and sound were most marked. Leeches were applied to the head, and twenty-five ounces of blood abstracted, within even more marked benefit than in the previous case; for within an hour the bad symptoms diminished, and rapidly disappeared. The patient recovered.

Here, then, are two cases in which "I think a man must be sceptical indeed, beyond all bounds of reason and common sense (if we may invoke that sense here), who refuses to connect effect with causation, the consequence with the antecedent, the cure of the disease with the venesection." And to go on quoting from Dr. Markham's lecture, "What other remedy do we know of under the sun which is capable of producing off-hand, then and there, such great results in such formidable disease." And yet phrenitis is not an inflammatory disease, "in the course of, or out of which, arise impediments to the play of the heart and lungs." I think we must admit, that the bleeding had an immediate, and probably a direct, effect on the inflammation in these two cases. What, then, is probably this direct effect?

Dr. Markham writes: "If venesection be of service in internal, it should equally be of service in external inflammations—i.e., in those inflammations whose progress we can see with our eyes. But in what records of 'bleeding' times will you find any satisfactory proof that it ever was of service in such inflammations?" I would, however, direct attention to what we can see of the beneficial effects of local bleeding in external inflammations.

Now, to an eye affected with strumous ophthalmia apply two leeches, and watch the effect. As the blood is withdrawn, it will be seen that the redness diminishes—becomes paler. Repeat the leeching at subsequent periods, and the same result always follows: the redness—this visible sign of inflammation

—immediately diminishes,* and does not return when the bleeding has ceased. What has caused this paleness? It is not simply that the leeching has partially emptied the engorged vessels, and thus relieved tension (which in this case, I think, is analogous to impeded action of the lungs when inflamed); because the very small quantity of blood that two leeches have abstracted can have produced little or no effect on the strength of the general circulation; and blood would be immediately forced, on the cessation of the bleeding, into the vessels, and the inflammation return as previously. But it does not. The paleness always remains for hours—sometimes is permanent. Evidently, some other and a more direct effect on the inflammation than the mere abstraction of the superabundant blood, thus affording relief to tension—to impeded circulation—has taken place. What is it?

Into a forearm, affected with severe inflammation of the cellular tissue and skin, before pus has been formed, make free incisions. Tension is at once relieved. But observe the change in the redness as the blood flows from the wounds. Immediately around the incisions a white margin appears; then pale spots here and there through the bright red; these rapidly enlarge, coalesce, and transform the brilliant into a pale dingy red. What had been severely inflamed one minute before is so no longer. Introduce lint into the wounds, so as to stop the bleeding effectually: the bright redness does not return, as it would do if the engorged vessels had been simply relieved of their superabundant blood. Manifestly, some other effect on the inflammation has taken place. What is it?

The explanation of the cause of the paleness given by Mr. Lister is, I believe, the correct one. The blood-vessels in the immediate vicinity of the incisions contract, as it were in defence of the loss of blood; this contraction by nervous influence spreads rapidly to the smaller arteries around; and the supply of blood to the inflamed parts becomes almost as effectually cut off as if pressure had been applied to the main artery of the limb. The parts now have the benefit of *rest*, and, before the contraction of the arteries yields, have so far recovered that they do not in many cases again inflame. But does general blood-letting act in the same manner in internal inflammations—viz., by affording *rest* in some degree to the inflamed parts? I think it does. When a man with an inflamed brain is bled till he is faint, the first effects must be to relieve the brain in some degree of its superabundant blood, and thus diminish tension; and the second, to induce general pallor, then syncope; *i. e.*, to cause contraction of the arteries of the body in general, including those supplying blood to the brain, and thus diminish the quantity of blood sent to the inflamed parts, and afford them *rest*. When a patient suffering from rheumatic ophthalmia is bled freely, we can absolutely see that the inflamed parts participate in the general contraction of the arteries of the body—in the general pallor. And if this be the case with the eye, surely it must be so with the brain, lungs, heart, or any other inflamed organ.

* If Dr. Marshall will refer to the BRITISH MEDICAL JOURNAL of April 2nd, 9th, 16th, 23rd, 30th, and May 7th, 1864, he will find that Dr. Markham has, in his Lectures delivered before the Royal College of Physicians, referred to the excellent effects of the local abstraction of blood from inflamed parts, and has explained it in part by reference to its local action over the vaso-motor nerves. Dr. Markham has there shown, or endeavoured to show, that venesection and the local abstraction of blood are remedies totally different in their effects as regards inflammation; that to bleed a man for inflammation of the conjunctiva, for example, and to draw blood immediately from the conjunctiva by leeches, are to perform two distinct and essentially different operations—to use two distinct and essentially different remedies. EDITOR.

The facts, then, concerning blood-letting are: that it does in many cases produce a most marked, immediate, beneficial effect upon some inflammations; that it relieves tension—impeded circulation—impeded action—by causing diminution of the quantity of the circulating fluid, by enfeebling the heart's action; that, when used locally, it causes an immediate paling of the redness, which does not return when the bleeding is stopped. When used generally, it causes universal pallor and syncope. The inference naturally is, in the first, that it has caused contraction of the arteries supplying blood to the inflamed parts; and in the second, that it has caused contraction generally of the arteries of the body.

The theory of its action I deduce from the above facts and inferences is, that by diminishing tension, and cutting off in a great measure the supply of blood, it gives the inflamed parts *physiological rest*—that most powerful of all remedial agents.

ON THE PHYSICS OF DISEASE, AND THE PHYSICAL PATHOLOGY OF THE BLOOD.

By BENJAMIN W. RICHARDSON, M.A., M.D., Senior
Physician to the Royal Infirmary for Diseases
of the Chest.

CHAPTER III.

*Conditions which Modify Oxidation of Blood (continued).
Further Researches on Ozone.*

At the close of my last chapter, I adverted to the effect of ozone, or active oxygen, on carnivorous as distinct from herbivorous animals. The remarks there made, I will ask the reader kindly to bear in mind as the subject progresses.

In the year 1852, I constructed an apparatus by which freshly made oxygen could be passed in current over animals confined in chambers properly constructed so as to allow them freedom of motion, and at the same time prevent them from receiving any air save that which was specially supplied to them. By sending oxygen through the chamber in free quantities, perfect ventilation was sustained, and no accumulation of carbonic acid could take place. The oxygen, as it was used, was in the active state; but the quantity of ozone present was small. Arrangements were made by which the animals subjected to the oxygen could be supplied both with liquid and with solid food.

A cat was first placed in the oxygen chamber; no attempt was made to save the gas; and the current of gas was sustained so steadily, that at any time a partly extinguished taper could be re-lighted at the escape-tube. For an hour and a half the animal breathed the gas, the temperature being 65° Fahr., without signs of derangement. Then the breathing became quickened and harsh; and thirst was a prominent symptom. After breathing the oxygen seven hours, there was slight convulsive movement; the animal was, therefore, set at liberty in the open air, but it continued to sink, and died at the end of three hours. On examination, the lungs were found to be intensely red in colour, but no organ had undergone structural change. The cause of death was separation of fibrine in the right side of the heart; the right auricle was choked with a firm fibrinous mass, which was of a pure white colour, and adhered closely to the muscular wall.

In another experiment, results of a like kind were produced in a guinea-pig. In a pigeon exposed for nine hours to the gas, symptoms resembling those of croup were induced; the animal breathing with a

distinct croupy inspiration. In this animal, the blood was found firmly coagulated in the cavities of the heart; and in the upper and the lower segments of the trachea there was distinct fibrinous exudation.

From these experiments, it seemed to me conclusive that oxygen administered in the manner I have described was generally destructive of animal life by increasing waste and causing separation of fibrine in the blood. The inference was not just, as the following experiments will show.

On July 9th, a rabbit was placed in the same chamber in which a number of the experiments, described above, had been performed. The oxygen was made in the same way, and transferred in the same way. At first the animal seemed excited, and often thirsty; but it also ate voraciously of green food. During nine days it was kept in the stream of gas; and no material change followed. It was now removed from the oxygen. It weighed four ounces less than before the commencement of the experiment; but otherwise it was unaltered.

After the lapse of a week the rabbit was replaced in the chamber, and the administration of the gas recommenced. This time the exhibition was kept up for twenty-one days, without any indication of dying or even of suffering on the part of the subject. Once more the animal was placed in the common air, and it lived many months. It continued always thinner than it was before being submitted to the action of the gas; but that was all.

One or two special changes which occurred during the inhalation of oxygen, should not escape notice. There was often a brilliant vermilion tint of the ears; and when the creature wanted food, the breathing was more hurried, varying from fifty to even one hundred respirations a minute. On two or three occasions it became oppressed, and the *alæ* of the nose worked rapidly. Then the current of gas was supplied a little more swiftly, and at once the animal became as alert as before.

I witnessed in this experiment the results obtained by Lavoisier, and by that section of observers who have considered that the inhalation of oxygen is not attended with danger, even though sustained for long periods of time. What was more, whenever I repeated these experiments on the same kind of animals, I obtained the same results to the letter. Dogs, cats, pigeons, and Guinea-pigs died; but rabbits lived on. The fact, so often repeated, led me to think that the differences arose from the animal employed. To settle this point, I made the following experiments.

I constructed a chamber of a cubic capacity of two feet. I made a perforated false bottom as before, and put beneath this potash for taking up carbonic acid. I arranged so that I could change the potash at pleasure. The chamber was then divided into stalls by perforated zinc; and a neat and effective plan was made for introducing food into each division. Eighty gallons of oxygen gas were then made in two reservoirs; and the chamber was tubed for a current as in the one already described.

There were now placed in the chamber in the different stalls, a dog, a kitten, a rabbit, a pigeon, and three frogs; and the oxygen-current was turned on. The pigeon began to suffer from rapid breathing in two hours, and its legs, previously pale, became vermilion red. The dog suffered more; the kitten less. At the end of twelve hours, the dog was nearly dead; the pigeon was drooping; and the kitten was suffering considerable excitement. The rabbit was as well as ever. The frogs were also uninfluenced. On removing the animals, the dog died almost immediately. The other animals slowly recovered.

On a succeeding day I repeated this experiment on

other animals of the same kind, continuing it for thirteen hours. The result was the death of the pigeon and of the kitten; great prostration of the dog, which, however, recovered on removal into the air; and entire escape of the rabbits and the frogs. The temperature in all these experiments was from 60° to 65° Fahr.

We gather from these experiments the fact, that in carnivorous animals and in birds ozonized oxygen, at ordinary temperatures, produces what would be called pathologically a general inflammatory condition, with death from separation of fibrine, as is common in inflammatory diseases. We see also that in one experiment local inflammatory mischief was induced in the trachea. In rabbits, the circulation is quickened by the same process, and waste of tissue results, but the animals are enabled to live. In a succeeding chapter, I shall show the effects on similar animals of common air charged with ozone.

TINCTURE OF DIGITALIS IN DELIRIUM TREMENS.

By JAMES POLLARD, Esq., Torquay.

J. M., aged 46, a strong muscular man, much addicted to drinking, was kicked by a horse in the leg, which became inflamed, and confined him to his bed. On being sent for on Friday evening, January 6th, I found him very restless, tossing about in bed, fancying that dogs were biting him, and other delusions. His wife informed me that he had not slept for the last two nights, and that she had had great difficulty in keeping him in bed. I at once gave him a strong glass of brandy and water, with half a grain of muriate of morphia.

Jan. 7th. He passed a troublesome night without any sleep. I prescribed for him two cathartic pills to be taken immediately; a saline mixture during the day; and in the evening, half a grain of morphia and half a drachm of tartar emetic wine every two hours, which was given regularly until 10 p.m. on the 8th without any good results.

About 2 a.m. the following morning, I was requested to see him immediately, as it took three men to keep him in bed; and on my arrival I found this to be the case. I then gave him four drachms of tincture of digitalis. He very soon afterwards became tranquil and slept for an hour.

At 4 a.m., three drachms more of the tincture were given (about half an hour afterwards he became very sick), which kept him quiet until 10 a.m., when, as he became again disturbed, the draught was repeated containing four drachms of the tincture. He did not sleep, though he was quiet till evening, when I again saw him, and found him as bad as ever. Four drachms more of the tincture were given, with the best results, as he slept the whole of the night and the greater part of the next day; and from that time he rapidly progressed.

I believe that, if I had given him the fourth dose at a shorter interval, a more satisfactory result would have been earlier produced.

THE IRISH MEDICAL MAN, says Dr. Mackesy, "is exposed to great risk from contagion. He has to combat fever in all situations and at all seasons. It is a startling fact that the mortality—the proportionate deaths of the medical officers of Irish charitable institutions, exceeded by more than one-half the proportionate deaths of the officers of the British army during the Peninsular war."

LEEDS GENERAL INFIRMARY.

STATISTICAL TABLES OF THE OPERATIONS PERFORMED FROM JANUARY TO JUNE, 1864, INCLUSIVE.

[Continued from page 116.]

Strangulated Hernia.

No.	Sex and age.	Operator.	Nature of operation.	Stay in Hospital after operation.	Result.	Remarks.
1	M. 15	Mr. S. Hey	Herniotomy.	3 days	Death from strangulation. Reduction <i>en masse</i> .(?) Sac opened.	This was a congenital right scrotal hernia as large as a hen's egg. Strangulation commenced eleven hours before the operation. The sac was opened, and found to contain bowel. A constricting band at the neck was divided, and without the exercise of much force the bowel was returned. Symptoms of strangulation continued until his death. At the <i>post mortem</i> examination it was found that the bowel had escaped through a rupture in the sac anterior to the strictured neck, and was lying between the peritoneum and the abdominal muscles.
2	M. 45	Mr. S. Hey	Herniotomy.	44 days	Recovery. Sac opened.	A left inguinal hernia, the size of an egg, strangulated five hours. In 1858, the same hernia had been reduced by operation; and in 1863, by taxis in warm bath. The sac was opened, and contained bowel only; very severe peritonitis followed; and subsequently a large abscess formed in the sac. For some time his life was in great jeopardy, but he ultimately made a good recovery.
3	F. 59	Mr. Wheelhouse	Herniotomy.	47 days	Recovery. [Sac opened.]	This patient had had a right femoral reducible hernia, of the size of a large walnut, for twelve years, and had never worn a truss. Strangulation had existed three days, and did not yield to taxis under chloroform. The sac was opened, and besides fluid, contained a knuckle of slightly inflamed intestine. The bowels were moved for the first time on the thirteenth day after the operation by a small enema. She recovered without a bad symptom.

Removal of Ovarian Tumours.

No.	Sex and age.	Operator.	Nature of operation.	Stay in Hospital after operation.	Result.	Remarks.
1	F. 30	Mr. Nunneley	Ovariectomy.	2½ hrs.	Operation abandoned. Death.	The patient had had six children; the youngest was eleven weeks old. During her last pregnancy—before which her health had been in all respects good—she noticed that her body increased much more rapidly than usual, and during the whole period she suffered excruciating pains in the abdomen and back. After her confinement, the body remained very greatly distended. She was, on admission, thin, pale, sallow, and apparently worn down by great suffering. Eight days before the operation, a trocar was thrust into the tumour, but no fluid escaped. An incision, seven inches long, was made down to the sac, and universal adhesions to the abdominal wall separated by the introduced hand; the sac was now tapped, but in consequence of the thick flaky contents blocking up the cannula, very little fluid escaped; a free incision was then made into the sac, and its contents turned out by the hand; several smaller cysts were emptied into the larger one. On further examination, the adhesions were found to be universal, involving liver and bowels to such an extent as to render separation of the cyst impracticable. The operation was therefore abandoned; the opening in the cyst was closed by continuous suture, and that in the abdominal wall in the usual way. At the <i>post mortem</i> examination, the universality of the adhesions was proved, and the impossibility of removing the cyst placed beyond all question.

Cure of Stricture, etc., by Perineal Section.

No.	Sex and age.	Operator.	Nature of operation.	Stay in Hospital after operation.	Result.	Remarks.
1	M. 48	Mr. S. Hey	Perineal section.	34 days	Recovery.	There was extravasation of urine into perineum, scrotum, and penis, with retention, caused by a gonorrhoeal stricture of thirty years' standing. Deep incisions were made into the infiltrated tissues, and one in the median raphe of the perineum, laying open the urethra. When all had become quiet, the stricture was treated by dilatation with bougies; and at the time of his discharge, all the wounds had closed, and a full-sized instrument could be readily passed.
2	M. 33	Mr. Nunneley	Perineal section.	2 days	Death from pelvic infiltration.	In this case there were an impassable stricture, four perineal fistulae, through which a considerable proportion of urine passed, and a large abscess distending the perineum. The stricture had resulted from two attacks of gonorrhoea, which he had acquired twelve and ten years ago respectively. In the operation, a grooved staff was made use of as a director.
3	M. 31	Mr. S. Hey	Perineal incision.	42 days	Recovery.	On the day before his admission, he fell astride the edge of a plank. There were complete retention of urine, with distended bladder, and infiltration of urine into the perineum, scrotum, penis, and groins. A deep incision was made in the raphe of the perineum, laying open the urethra, and at once giving free exit to the retained urine; others were made in the scrotum and penis. No sloughing of the parts followed. Seventeen days afterwards, a No. 9 catheter was introduced, and fastened in the bladder, where it was allowed to remain during eighteen days; after which, all the urine was passed <i>per urethram</i> —the perineal and other wounds having quite closed.

Operations for Stone.

No.	Sex and age.	Operator.	Nature of operation.	Stay in Hospital after operation.	Result.	Remarks.
1	M. 31	Mr. Teale	Lateral lithectasy.*	20 days	Death from exhaustion.	He was subject to attacks of acute mania, one of which came on just prior to the operation; and, persisting afterwards, caused his death by exhaustion. The stone was composed of oxalate of lime, and weighed 1½ drachms. No bad symptom occurred consequent upon the operation, nor was any lesion found on <i>post mortem</i> examination.
2	M. 4	Mr. P. Teale	Lateral lithectasy.	22 days	Recovery.	The calculus, coated with lithates, weighed two scruples. Urine ceased to flow by the wound on the thirteenth day. He recovered without an untoward symptom.
3	M. 40	Mr. Wheelhouse	Lateral lithectasy.	74 days	Recovery.	The calculus—a round mulberry, covered with very large projecting cones, weighing an ounce and a half—was extracted with considerable difficulty, owing to its peculiar formation, and to the fact that it was lodged above the pubes. Attacks of severe peritonitis several times endangered his life, and very much retarded his recovery. Some of the urine was passed by the wound up to a fortnight before his discharge from the hospital. He has since quite recovered.
4	M. 58	Mr. Wheelhouse	Lithotrity.	41 days	Recovery.	The stone was crushed on five occasions, an interval of about a week being allowed between the operations. On examining the fragments, composed of phosphates, of which a very small proportion (3ij) only could be collected, several were observed to contain vegetable fibre, which, on microscopic examination, was found to be hay. The patient acknowledged that, thirty years before, he had passed a stem of hay (flower foremost) down the urethra, and that his symptoms dated from that time.
5	M. 7	Mr. Nunneley	Lateral lithotomy.	48 days	Recovery.	An oval mulberry calculus, weighing nearly three drachms, was readily extracted through a free opening. The urine ceased to flow by the wound on the sixteenth day. No bad symptom arose throughout.
6	M. 46	Mr. Nunneley	Lateral lithotomy.	57 days	Recovery.	The calculus was flat and circular, weighed four drachms, was composed of lithic acid, and, being lodged above the pubes, was with some difficulty extracted by means of curved forceps. The patient was stout, very nervous and dejected, and had a deep perinæum. From the time of the operation, some of the urine passed <i>per urethram</i> , and on the fifteenth day ceased to flow by the wound. He recovered without a bad symptom; but on his discharge from the hospital, the wound had not quite closed.

* In "lateral lithectasy", the usual lateral incision is made, and the operation is completed by dilatation after Allarton's method.

Operations for the Reduction of Dislocated Hip.

No.	Sex and age.	Operator.	Nature of operation.	Stay in Hospital after operation.	Result.	Remarks.
1	M. 31	Mr. S. Hey	Reduction by manipulation under chloroform.	27 days	Recovery, with perfect limb.	The left femur was dislocated upon the dorsum ilii by a fall from a height of thirty feet. Having put him under chloroform, the leg was completely flexed upon the thigh, and the thigh upon the body, so as to form with it an acute angle; the whole limb was then forcibly rotated outwards, and on drawing the leg down, in order to ascertain its position, the head was felt, and heard to slip into the acetabulum.
2	M. 71	Mr. Nunneley	Reduction by manipulation under chloroform.	16 days	Perfect recovery.	This old man was knocked down and run over by a horse, whereby he sustained a dislocation of the right femur upon the dorsum. The signs were well marked. The limb was put through the usual movements; and, when drawn down, was found to be in its natural position, although no sound nor feeling of reduction had been manifested.
3	M. 20	Mr. S. Hey	Reduction by manipulation under chloroform.	13 days	Perfect recovery.	Dislocation of the right femur upon the dorsum alone was found to have resulted from a large fall of earth, which for a time completely buried him. The limb was reduced by one series of movements only, which occupied but a few seconds.
4	M. 30	Mr. P. Teale	Reduction by manipulation under chloroform.	19 days	Perfect recovery.	This patient had also been buried as high as the waist by a fall of earth, and thereby sustained a dislocation of the head of the femur into the left sciatic notch. A little difficulty was experienced in the reduction, in consequence, as was afterwards proved, of the rotation outwards having been made whilst the thigh was flexed at too acute an angle with the body.
5	M. 13	Mr. P. Teale	Reduction by manipulation under chloroform.	42 days	Good recovery.	Whilst working in a coal-pit, he was knocked down, and pushed for a distance of several yards before the wheels of a laden wagon. Dislocation of the right femur upon the dorsum, and fracture of the shaft of the left femur, resulted. One series of manipulations sufficed for the reduction.

In July, a sixth case, in a child two years and a half old, was reduced also by manipulation under chloroform, with a perfect result.

Progress of Medical Science.

ANATOMY, PHYSIOLOGY, & PATHOLOGY.

ACTION OF IODINE AND IODIDE OF POTASSIUM ON THE NERVOUS SYSTEM. Dr. M. Benedikt, having observed that the injection of tincture of iodine suddenly produced paralysis of respiration and circulation, has been led to investigate the action of iodine on the nervous system. His experiments, seventy in number, have been made on frogs. The solution of iodide of potassium used contained one part in four of water; the tincture of iodine had a strength of one part to three or six. He has found that iodine and iodide of potassium, especially the latter, immediately affect respiration; that sensation is diminished and finally disappears; that the heart is paralysed more quickly by iodine than by the iodide of potassium; and that muscular contractility is lost sooner than that of the heart when small doses are employed. The application of iodine or of iodide of potassium to the central extremity of the spinal cord arrests respiration, circulation, and muscular contractility, much more rapidly than when the poison is introduced into the circulation. The symptoms of poisoning are more slow in appearing when the poison is applied to the peripheric extremity of the cord. Introduced into the circulatory current, iodine and iodide of potassium attack the central extremity of the cord, and excite or paralyse the organs of respiration and circulation, and the sensory and motor nerve-fibres. (*Medizin. Jahrbücher*; and *Gaz. Méd. de Paris*, 29 Oct., 1864.)

THE ORIGIN OF LYMPH. M. Ludwig of Vienna has combined the results of a series of researches made by himself and by Noll, Krause, Schwanda, and Tomsa. The lymphatic vessels, he says, do not commence in closed tubes, but in interstitial lacunæ traversed by blood-vessels. He has described and given figures of this arrangement in the testes, the intestinal mucous membrane, and several other organs; and concludes that it is universal. He attributes the production and the flow of lymph to the pressure of the blood. According to this theory, lymph is nothing but blood-serum filtered through the walls of the vessels. (*Medizin. Jahrbücher*; and *Gaz. Méd. de Paris*, 29 Oct., 1864.)

POSITION AND FUNCTION OF THE CILIARY PROCESSES. Dr. Otto Becker has studied, by the aid of the ophthalmoscope, the eyes of seven albinos. Four of them had the iris so transparent, that objects situated behind it could be seen perfectly. They were aged respectively three weeks, and 6, 14, and 28 years. Dr. Becker arrives at the following conclusions. 1. The ciliary processes are situated outside and in front of the edge of the crystalline lens. 2. Their length varies with the size of the pupil. When this is dilated, the ciliary processes become longer, and are shortened when the pupil contracts. 3. When the ciliary processes enlarge during the dilatation of the pupil, they glide forward in the posterior chamber of the eye between the peripheric portion of the iris and the anterior aspect of the lens; but they do not touch the latter either at its edge or in front. 4. The brilliant edge which the crystalline lens exhibits under direct light, and its dark edge when lighted from behind, are phenomena of reflexion. The size of this border depends on the width of the angle at which the two surfaces of the lens meet. As this angle is enlarged when the lens is thickened

in the direction of the visual axis, an increase in size of the border is a sign that the lens is becoming thickened, and in this way the change in the lens produced by accommodation can be directly observed. Dr. Becker concludes that the ciliary processes are never in contact with the lens, and recede further from it when the eye is accommodated to viewing objects at a distance. (*Medizin. Jahrbücher*; and *Gaz. Méd. de Paris*, 29 Oct., 1864.)

PATHOLOGICAL CHANGES IN THE KIDNEY IN ALBUMINURIA. M. Cornil, in a paper read before the Société de Biologie in Paris, gives the following conclusions. 1. Renal congestion is not sufficient for the production of albuminuria; there must also be an anatomical lesion of the epithelial cells of the uriferous tubules. 2. This lesion of the epithelial cells—which is constantly found in albuminuria, however slight or transient—consists in a tumefaction of the cells, which are filled with granules, first of protein substance, afterwards of fat. This state of the tubes is met with both in transient and in permanent albuminous nephritis. 3. Temporary albuminous nephritis (*nephritis catarrhalis* of Virchow and Rosenstein) occurs very frequently in typhoid fever, in typhus, cholera, puerperal fever, erysipelas, etc. 4. Persistent or parenchymatous albuminous nephritis comprehends three forms. (a) Simple albuminous nephritis may supervene on the temporary form already mentioned, and differs from it only in the gravity and extent of the morbid changes: it begins with an enlargement of the cells, and ends in their complete transformation into fat-granules. This is the most frequent of all the lesions of the kidney which produce albuminuria. (b) Albuminous nephritis may be accompanied by fatty degeneration of the vessels (arteries, vessels of the glomeruli, and capillary network). Although these lesions may co-exist with simple albuminous nephritis, there are generally found, at the same time, commencing atrophy of the kidney and granulations in the cortical substance of the organ, produced by atrophy of the surrounding tubules, while the tubules and the glomeruli preserve their normal dimensions within the nodule. For the production of these granulations, nothing is necessary beyond an excessive formation of the cellular tissue of the kidney. (c) Albuminous nephritis, with so-called amyloid degeneration of the vessels, presents two varieties, the altered parts simply becoming brown on the addition of iodine and sulphuric acid, or passing through all the colours of the prism. This form sometimes succeeds the form (a), of which it is only a complication. 5. Epithelial and hyaline cylinders are met with in large numbers in all cases of albuminuria; they may be found, but very rarely, in healthy urine. Hyaline cylinders, of waxy appearance and encrusted with fatty granules or covered with cells that are undergoing fatty degeneration, are only of value in the diagnosis of persistent or parenchymatous albuminous nephritis. 6. Fatty degeneration of the cells may be met with in the tubules, although there may be little or no albumen; this has been especially observed in cases of poisoning by phosphorus, and in severe icterus. (*Gazette Médicale de Paris*, 12 Nov., 1864.)

HYDATID CYSTS OF THE BRAIN. In a paper read before the Société de Biologie, Dr. Leven states that the symptoms produced by hydatid cysts on the cerebellum do not differ from those of other tumours in this region; but that this is not the case with cysts in the cerebrum. They do not give rise to inflammation of the brain-substance; they gradually increase in size, and always tend in the direction of the lateral

ventricles. Pressing on the floor of the ventricles, they produce atrophy of the parts constituting the lower floor. Tubercle and cancer produce phlegmasia of the periphery, and are attended by congestion, hæmorrhage, and softening. Dr. Leven divides hydatid cysts into two classes; those seated on the surface of the brain, and those in or near the lateral ventricles. He has collected the observations of thirty cases. With cysts at the surface of the brain, the principal symptoms were headache and epileptoid attack. When the cysts were at the level of the ventricles, the principal symptoms were those of disturbed motor power. In fifteen cases, there were tremblings, weakness of gait, difficulty in standing, frequent falling, and choreic movements. Hemiplegia was observed in ten cases, at an advanced stage of the disease. More or less complete loss of voice was met with in nine cases. Disturbances of sensibility were more rare, being found in seven cases only; disorders of the intellect were met with in thirteen instances. The functions of the organs of sense were frequently disturbed. Strabismus was not met with; but there was amaurosis, at first single, then double, in half of the cases; deafness occurred in four, and hallucinations of vision in two; fifteen patients had epileptoid attacks; vomiting occurred in six cases; eight of the patients died in a state of coma, and four suddenly. (*Gaz. Méd. de Paris*, 3 Dec., 1864.)

FUNCTION OF THE SPLEEN. MM. Estor and Saint-pierre, in a note presented to the Academy of Sciences, state that they have endeavoured to determine the amount of oxygen in the arterial and venous blood of the spleen of dogs, during digestion and during fasting. They found that, while the amount of oxygen in the arterial blood is constant, that in the venous blood is increased, and may be even doubled, in the fasting animal. Thus, in one animal, after finding 11.69 of oxygen in the blood of the splenic vein of a dog which had fasted twenty hours, they injected milk into the stomach, and found that the blood of the same vessel contained 7.26 of oxygen. From five experiments, they arrived at the following average: blood of the splenic artery, 14.38; of the splenic vein during digestion, 5.70; in fasting animals, 11.53. They hence conclude that the spleen alternates in function with the stomach. (*Gaz. Méd. de Paris*, 21 Janvier, 1865.)

THE CAUSE OF THE RESPIRATORY MURMUR. DR. A. T. H. Waters believes the air-sacs of the lungs to be the seat of the murmur. The air-sacs consist of somewhat elongated cavities, which communicate with a bronchial ramification by a circular opening, which is usually smaller than the cavity to which it leads, and has sometimes the appearance of a circular hole in a diaphragm, or as if it had been punched out of a membrane which had closed the entrance to the sac. It is obvious that a condition of this kind must have an influence on the passage of the air into the air-sac; that, to a certain extent, it must produce an impediment to the current of air, and thus would give rise to a sound. As the air is moved along the bronchial tubes it meets with no obstruction to its passage; but at the commencement of the air-sacs an opening exists, which is smaller than the cavities between which it is placed. As the air-sacs expand with each inspiration, air must pass through the constricted opening. Dr. Waters believes that, in the passage of air through this opening, the main element of the respiratory murmur consists. The following facts appear to him to afford arguments in favour of the view advanced. The respiratory murmur is loud and well marked in infancy and childhood; it becomes modified in adult age; and in

old age it is frequently very feeble. In the infant, the membrane placed at the mouth of the air-sac is well marked and uninjured; the opening in it has a clearly defined and hard margin; and, moreover, it is smaller—not only absolutely, but, he believes, also relatively—than in after life. In the adult, the air-sacs have undergone enlargement, and the membrane at their entrance is more or less perfect according as the lung is in a more or less healthy state; whilst, in old age, the membrane has often, to a great extent, disappeared, apparently as the result of the wasting and absorption which so frequently occur in the lungs of those advanced in life. Further, the changes which take place in the character of the respiratory murmur in emphysema of the lungs afford an additional argument in support of this view. In this disease, in consequence of distension, rupture, and absorption, the air-sacs become much altered in character, and the membrane guarding the entrance to them entirely disappears as the disease progresses. The obstacle to the passage of air is therefore removed; and hence the reason of the extremely feeble respiratory murmur which characterises the affection. (*Brit. and For. Med.-Chir. Review*.)

Reviews and Notices.

LECTURES ON DISEASES OF THE STOMACH; with an Introduction on its Anatomy and Physiology. By WILLIAM BRINTON, M.D., F.R.S., Physician to St. Thomas's Hospital. Second Edition. Pp. 368. London: 1864.

IN this second edition of his work, Dr. BRINTON has made such revisions and additions as his extended observation has shewn to be necessary in the lectures formerly published; and he has also added two new lectures, viz., on Gastric Phthisis, and on "Gout in the Stomach."

In the lecture on Gastric Phthisis, Dr. Brinton, noticing the frequency with which phthisis is accompanied by digestive disturbance, observes that it is impossible to determine absolutely the causal relation of the two affections to each other.

"In some instances, it is fair to infer that the dyspepsia causes the phthisis; which, in point of time, it certainly precedes and ushers in. In other cases, perhaps more numerous, the thoracic lesion and the gastric disturbance seem to be twin effects of a common cause—a bad or cachectic state of the constitution. Far oftener, I believe, the dyspepsia, as well as the various appearances which we sum up by the word cachexia (so far as the word has any exact meaning) is itself the result of the injurious action of tuberculous deposits—dying, dead, or decomposing—in the tissues of the body or the system at large." (P. 340.)

These forms of dyspepsia attending consumption, Dr. Brinton thinks, may be arranged for consideration into a class of cases which he proposes to denominate *gastric phthisis*—a condition which, while its symptoms merge into those of ordinary dyspepsia by almost imperceptible gradations, yet presents sufficiently well-defined characters. The following is his account of a typical case.

"The patient, usually under thirty-five years of age, feels the first approach of the malady as an 'indigestion,' an epithet which, on inquiry, resolves itself into a pain beginning between the first and second hours after food, and going off gradually. At

first such a pain often follows but one of the daily meals; perhaps oftener a full morning repast. It rarely brings with it any flatulence; and is still more rarely relieved by eructation. As the malady advances, the pain becomes more frequent, and follows all the meals; only distinguishing by attacks of unusual severity, those in which the food is more copious in quantity, or more solid and indigestible in quality. By and by, the sickening depression which has gradually been recognised as an element of the increasing pain diverges into distinct nausea; and this again soon provokes retching; which, in its turn, sometimes gradually deepens into vomiting. Often, however, the latter symptom remains long or permanently absent. If present, it is only rarely, or after long persistence, that it brings back from the stomach any of its alimentary contents; and even then scarcely ever unloads the organ, much less relieves the pain by which it is preceded. By longer continuance, the pain and retching become more severe, and more easily provoked; and therefore continually approach the period of taking food, so as not only to follow it by a shorter interval, but at length to limit the meal to little more than painful and unavailing attempts to take food, the suffering which immediately follows its deglutition becoming almost unbearable. The climax of gastric disturbance thus attained is, in rare instances, itself the chief cause and immediate forerunner of death. But it much more commonly either inaugurates a rapid infiltration of the lungs with tuberculous deposit, or is displaced by the thoracic symptoms of tubercle already deposited; to alternate (it may be) with such symptoms during the brief remainder of life. In other cases, the dyspepsia amends spontaneously, or is vanquished by appropriate treatment; and the patient, slowly recovering flesh and strength, advances towards that imperfect health which, in so many instances, is associated with the retardation or arrest of the progress of tuberculosis; perhaps until the infirmities of declining years, mingled with the insidious symptoms of the malady, leave us in doubt to which of these two causes—natural decay or tubercular disease—we must chiefly refer the eventual death." (Pp. 342-3.)

Regarding this affection, Dr. Brinton finds that it is hereditary; but that there is less frequent evidence of this than in ordinary phthisis, so that Dr. Brinton has found the gastric disease in a considerable number of persons whose family history was free from suspicion of tubercle; and that various members of the same family may be affected, some with gastric phthisis and others with ordinary tuberculosis.

The relation of the chest-symptoms to the gastric lesion is at first sight paradoxical; inasmuch as it is indicated sometimes by the presence of thoracic symptoms, sometimes by their absence. That is to say, while the presence of large or advanced lesions of the lungs suggest that any present gastric disturbance is of phthisical origin, Dr. Brinton has, on the other hand, rarely or never found the typical gastric phthisis which he has described to be attended by signs "indicative of the presence of even moderate aggregations of tubercle in the lungs, much less of their disintegration and removal."

As further characteristics of gastric phthisis, Dr. Brinton points out that the febrile reaction is in excess of that met with in cases of ordinary dyspepsia or even of gastric ulcer; that the pain varies in intensity and in situation, rarely or never, however, becoming what patients call "spasm"; and that the relation of the pain to food is comparatively

capricious and uncertain. Vomiting sometimes occurs so rapidly after food as to supersede pain; and in such cases it is difficult often to determine its cause. Hæmorrhage is absent; and this Dr. Brinton thinks, indicates a bloodless rather than a congested state of the stomach. Constipation is the most frequent intestinal disturbance; but the bowels are often unaffected. Diarrhœa is also sometimes met with.

In regard to its pathology, Dr. Brinton considers gastric phthisis to be "a kind of neuralgia of the pneumogastric and sympathetic nerves"; and he draws an analogy between the phenomena which it exhibits and those of facial neuralgia.

The treatment of the disease in many features approaches that of ulcer of the stomach, which it often closely simulates. It is very amenable to systematic treatment, and its worst symptoms often yield very promptly; but amendment is liable to be interrupted, and the interruption requires decided measures to prevent serious relapses. As medicines, opium and other strong sedatives are generally objectionable; alkaline carbonates, either free or in effervescing draught, and small doses of iodine, are most useful. Bismuth is often advantageously added; and the above mentioned remedies may be given in some light bitter infusion, such as *calumba*. Blisters are of doubtful utility; all mercurials must be carefully avoided. The simplest purgatives alone should be given; and, if there be suspicion of accumulation in the colon, a gruel enema, with olive- and castor-oil, should be administered. Preparations of iron, which may be combined with iodide of potassium in small doses, are often of great service. The diet should at first consist of small and frequent doses of milk, or meat-broth, with farinaceous food; and should be increased gradually as the patient can bear it. A moderate quantity of alcoholic stimulant is generally beneficial from the first.

On the subject of "Gout in the Stomach", Dr. Brinton is sceptical; although he does not deny that there may be such a disease. He believes, first, that "any sufficiently sharp or sudden dyspepsia occurring in persons known or suspected to be gouty, is apt to be dignified by this term"; and he endorses the facetious hint of Dr. Watson that the word "gout" should sometimes be substituted for gout. Other cases of "gout in the stomach", he believes to be in reality cases of biliary colic; others are connected with disease of the kidneys; while others, again, are referrible to disease of the heart.

These various affections being removed, Dr. Brinton can only say that he knows of no case of "gout of the stomach"; that he has never seen one; and that he has never been able to obtain trustworthy evidence of one. But he does not deny the possibility of its existence.

Dr. Brinton has put before the profession some important matter for consideration in those additional lectures; and has increased the value of his instructive work.

DONATION. At the meeting of the Committee of King's College Hospital, an old friend of the charity, who requested that his name should not be mentioned, attended and handed to the chairman the munificent sum of £504, being 16 new life governor's donations of 30 guineas each, in aid of the current expenses of the hospital.

WE beg to remind the members of the Association that the annual subscription is now due. Payment of the same can be made either to the Honorary Secretaries of Branches; or to the General Secretary, T. Watkin Williams, Esq., 13, Newhall Street, Birmingham.

British Medical Journal.

SATURDAY, FEBRUARY 18TH, 1865.

SYPHILISATION.

THE subject matter of a correspondence between Mr. Henry Lee and Professor Simpson, which has lately appeared in the JOURNAL, is worthy of attention in several respects. Whoever has read the same will have wished good luck to any one, or to any Commissioners, who will tell us what is syphilis, and what is its proper treatment. A few weeks ago, we gave a summary of a paper by Dr. Simpson—a son of the Professor—in the *Edinburgh Monthly Journal*, containing details of two cases of syphilis which had been treated by syphilisation by Professor Boeck. Assuredly these cases were very remarkable. They were cases of very severe constitutional syphilis, which had defied all the ordinarily employed curative means in this country, but had, under Professor Boeck, readily yielded to syphilisation—were completely cured. (See BRITISH MEDICAL JOURNAL, Jan. 28th, 1865, p. 89.)

Now, one of these cases reported by Dr. Simpson as completely cured in 1861, has, it appears, been under the hands of Mr. Henry Lee during the last eighteen months; and Mr. Lee writes and assures us that it was not a case of syphilis at all; but that the disease was softening of the bones—a family affection in this particular case. Surely Mr. Henry Lee ought to know a syphilitic affection when he sees it; and surely, one would think, he would not lightly, in such a case, declare that the symptoms and history negated the idea of syphilis unless the facts were very sure and satisfactory to his mind. But to him Professor Simpson (in the absence of his son) rejoins; and assuredly the statement he makes is not to be lightly explained away.

“Dr. Rynd of Dublin” (says Professor Simpson) “who attended the patient during the existence of the primary disease, declared the sore to be syphilitic; and Dr. Guthrie, Professor Miller, and Professor Boeck, who had him successively under their care after the tertiary symptoms broke out, never, I believe, had a single doubt as to the syphilitic character of his malady. I never saw a more distinct and marked case of tertiary syphilis.”

Thus, then, we have all this weight of positive evidence in favour of the syphilitic character of this disease. When fairly weighed, must it not be considered as of greater value than Mr. Henry Lee's

negative evidence? We leave others to answer the question; and will content ourselves with saying that it is very unfortunate to find great authorities so divergent in opinion as to what is, and what is not, syphilis.

But other points of great interest are involved in this little episode.

Mr. Henry Lee asserts that Professor Boeck must in this case have inoculated the patient with matter from a soft, a non-infecting, sore. Because, as he argues, and according to his creed, if the patient had been inoculated with matter from a hard, an infecting, chancre, he would have necessarily had syphilis inoculated into him, and, in fact, would have brought back from Copenhagen a disease which, according to Mr. Lee, he had not when he went there. Now, what shall we say, or rather what will Mr. Lee say, if Professor Boeck assure us that the gentleman was inoculated from a hard, an infecting, sore? But we will not further anticipate that difficulty; and will only add, under this head, what Dr. Simpson tells us; viz., that Professor Boeck now confines himself to inoculating with matter taken from indurated chancres; so that, in all probability, the gentleman in question was inoculated from an infecting sore.

Another point of great interest in the case is the fact of the wonderfully recovered health, recovered under the syphilisation. On this fact, at all events, we suppose, there can be no kind of doubt. The man had been in the hands of leading medical men in London and Edinburgh.

We wish, of course, to draw no forced connection between the cause and the effect; but the most sceptical as to the value of syphilisation as a cure of syphilis must opine that something *plus* the journey to Christiania may have had a beneficial action in the cases reported by Dr. Simpson. Both the patients were, we are told, in a desperate state. English doctors and English treatment availed them not. As a last hope, they were advised to go to Christiania. One was so reduced that he had to be carried on board the steamer bound for Norway; the other's condition was alarming. In three months, after a course of syphilisation, one patient returns and declares himself “almost as well as he had ever been in his life”; and in three months, the other patient is reported as returning home “perfectly cured”. Of the first case, Professor Simpson says in his letter that he “had lately seen the gentleman”, and that “he is in the enjoyment of the very best health”. The second case is the one lately under Mr. Lee's care. What effected the cure reported in these cases? Two gentlemen, apparently in desperate condition, incurable by Anglican or Scottish treatment, are, in a few weeks, by a sea-voyage to Christiania *plus* some 160 syphilitic ulcers artificially produced on their skin, “perfectly cured”. Was it the specificity of the inoculations which brought them from

the jaws of death to vigorous health; was it the sea-voyage, or was it the mere 160 ulcerations, emunctory or counter-irritant, on the surface of the body, which effected the cure? This question we will leave to the consideration of the Syphilitic Commission.

Another point, and perhaps the most important of all, in the affair, is the fact that Professor Simpson apparently gives in his adhesion to the practice of syphilisation: regards it, in proper cases of course, as an appropriate remedy. Surely, therefore, we may surmise, that it will not be long before the practice is put on its trial in this country: and surely, therefore, we are justified in sifting very carefully the value of the data upon which men consider they are justified in resorting to the practice. There is, we need hardly say, something in the character of the remedy which is, *à priori*, revolting to our moral sense, and which gives to the trial of it a much more serious responsibility than attaches to the trial of an ordinary remedy. Syphilisation bears with it consequences which do not end with the mere passing and temporary application of it. It is not like a remedy which purges, or sweats, or vomits a man. Clearly, therefore, and without entering into any judgment of its merits, we have a right to ask of any man who practises it, or recommends its practice, that he shall give clear, and explicit, and reasonable grounds for doing so. We read the cases of Dr. Simpson (detailed in the *Edinburgh Monthly Journal*); we read his high praises of the excellence of syphilisation; and we ventured to think that his facts did not satisfactorily bear out his praises. Dr. Simpson has also, we believe, seen Professor Boeck's practice, and no doubt his opinion has been much guided by what he has seen; but then he gives no details of what he saw. He describes the two cases above referred to; but we think more evidence is required than they afford to decide the value of syphilisation.

THE HUNTERIAN ORATION.

ON Tuesday last, the Hunterian Oration was delivered at the College of Surgeons by Mr. Partridge. The orator expressed the difficulty which he felt in performing the task. In the many orations already delivered, the subject had been exhausted. Mr. Partridge gave a short summary of the well known details of Hunter's life; the want of care in his early education; his happy introduction to the great men of science and of medicine of the day in London; his connexion with St. George's Hospital; and his comparatively early death. Mr. Partridge then spoke of the peculiarity of the man—his indefatigable earnestness in work, his devotion to scientific labour, his genius, and his warmth of imagination.

In the rest of the oration, Mr. Partridge referred to incidents of the lives of distinguished Fellows of the College who had lately died. He also gave some

interesting details of improvements made and making in the Museum of the College; and he wound up his discourse with a few words of reprobation to those "querulous and carping" spirits who are not contented with the rewards accorded to them as professional men, but who would step out of their proper sphere of scientific culture, and have medicine, for example, occupying a high place in the senate of the country. Medical men, he said, have no business with politics; and, in illustration of his position, quoted Sir Benjamin Brodie, who, he said, had declared that he regarded the Presidency of the Royal Society as a far greater honour than any peerage would have been to him. In all this part of his discourse, Mr. Partridge was, in our opinion, most unfortunate. Sir B. Brodie never had a peerage offered to him. In our opinion, also, one of the very greatest disadvantages under which our profession labours is, that it has no spokesman in Parliament. Not only does our profession, but the whole community, suffer through want of properly instructed men of medicine in the legislature, to advise and instruct. We side decidedly with the "carping, querulous" individuals rebuked by Mr. Partridge, who desire to see worthy and capable members of their profession sitting amongst the legislators of our country. If, in other days, there had been a doctor in the House of Commons, Mr. Partridge would probably not have had, in his oration, to refer to the ignorance and niggardness of the government in regard to Hunter's Museum.

Mr. Partridge, in his discursive remarks, also referred to the Venereal Diseases Commission; and, in doing so, we note that he repeated the views concerning it which have already been uttered in these pages. It is not likely, he hinted, that a Commission can tell us anything more than we already know about the disease and its treatment; and, if it does anything, it must be in recommending a prophylactic treatment. But, added Mr. Partridge, it is not very likely that Parliament will sanction the introduction of the continental system of governmental supervision of prostitution into this country. Mr. Partridge seems to be unaware of the fact that Parliament has already sanctioned an Act which gives powers far beyond anything which is to be met with in any regulations of continental countries in the matter of prostitution. Mr. Partridge, however, said that he had no doubt the Commission would do a good work; but then, as he was satisfied it would not be allowed by Parliament to do the only good thing which it was capable of doing—viz., registering and regulating by Police Acts prostitution—it is difficult to imagine what good it is likely to produce! Mr. Partridge lamented the loss to medical science resulting from the general neglect, in London as well as in provincial hospitals, of duly recording and registering the cases.

Mr. Partridge's oration was, speaking generally, of a discursive character. No doubt, he dreaded repeating what might have been an oft-repeated tale of Hunter and his doings; and, for this reason, said so little of the great man, and of his works, and of the impress which he has left in the world of science.

But has all yet been said that may be said of him? Are we to conclude, that the proper well of matter for an Hunterian Oration is dried up? Is the time arrived that the oration must cease to be Hunterian? We can hardly think so. Our own belief is, that many of the very latest additions to our physiological and pathological knowledge serve to illustrate the wonderful sagacity, or genius rather, of the man; that modern discovery, in fact, coincides with and explains many of those statements of his which have been to us hitherto obscure. A striking example of this may be found in the correctness of some of the views which he held concerning the condition of the capillaries in inflammation, and in the practical conclusions thence deduced by him; Claude Bernard's and other discoveries of the action of the vaso-motor nerves over the smaller arteries were assuredly, in some sense, anticipated by him. If we might venture to suggest a way of dealing with the Hunterian Oration, we should say. Let a physiologist and a surgeon, who is thoroughly alive to advanced physiology and surgery, study Hunter's doings by such light, and then show us how and in what a wonderful measure that genius was in advance of his age. We believe that he who would undertake the task, and is capable of performing it, would thereby erect a higher monument to the fame of Hunter than yet exists. If, as Mr. Partridge tells us, and as so many others have told us, Hunter's genius gave him a far glance into the future of science, how could an Hunterian orator be better employed than in now showing forth these fulminations of his genius?

M. GOSSELIN, of La Pitié, who may be regarded as one of the advanced and rising school of surgery in Paris, has lately expressed his opinion on the treatment of amputations. The main efforts of French surgery seem to be directed against the secondary evils, erysipelas, phlebitis, etc., which decimate their patients in hospital. One French surgeon of great note has almost entirely relinquished the use of the knife through dread of these evils—using the *écraseur* and other frightful proceedings even in large amputations. M. Gosselin considers three conditions as desirable in patients who undergo amputation: 1. They should be strong, and of good moral courage. They should not have the operation pressed upon them; but rather left to seek for it themselves, by inquiring of other patients around them, thus gradually reconciling themselves to it. 2. They should be placed under favourable condi-

tions, and especially as regards abundance of fresh uncontaminated air. The windows of the ward should be frequently opened. Nothing is so important as this; and upon this, he believes, depends mainly the success of operations at La Pitié. Then, again, consult the feelings of the patient as to the site of his bed. Is he too hot or too cold? Does he like his neighbours? Would he prefer another part of the ward? Has any patient near him a repulsive wound, erysipelas, etc.? 3. There is the proper surgical dealing with the case. In this particular case of amputation of the forearm, the patient was put under the influence of chemically pure ether.

"In this case, I was forced" (he said) "to do the flap operation; but, in general, I employ the circular, because it is less frequently followed by secondary hæmorrhage—a very serious accident. As regards dressing the wound, I may say, that the practice of all surgeons has for some years been greatly modified; for some time they attempted to procure immediate union. You know that I have long given up the practice; because, in this mode of proceeding, pressure and pulling is exercised on the borders of the wound; the stump is compressed, and the swelling attending its inflammation prevented; pain is excited, and putrid matters are retained on the surface of the wound. Moreover, experience has shown that union by the first intention is very rarely obtained in Paris in adults. Always, also, avoid giving pain; the greater the pain, the greater the chance of fever and purulent infection. I place the stump on a pillow covered with oil-silk, and cover it with a compress dipped in cold water; but only the anterior and lateral parts of it—so that the compress may be changed three or four times a day without moving the stump. When the inflammation and pain are gone, when all the mortified parts, etc., are removed, I attempt secondary union by bringing the edges of the wound together with diachylon. As to food, I feed the patient well. And as regards his *morale*, observe that I avoid in the dressing of his stump everything which may make him anxious or afraid. I enjoin the sister and nurses and patients around to trouble him in no kind of way; and I have removed from near him any patient whose life is in danger. Be well assured that all such precautions are of consequence and of a first necessity to all nervous patients; and never forget that, amongst the prime causes of traumatic fever and of purulent infection, must be placed physical and moral suffering."

DR. ROGER, in a clinical lecture on Infantile Syphilis, lays great stress (in the matter of diagnosis) on the time of the appearance of the first symptoms of the disease. Congenital syphilis is very rarely observed. The symptoms are almost always observed for the first time between the first and third months of extrauterine life.

M. Rayer has presented to the Academy of Sciences, in the name of Dr. Desormeaux, an instrument destined to aid in the introduction of light into the urinary passages—an instrument the first idea of which is due to M. Ségalas. Mr. Avery, our own countryman, was engaged in the making of such an instrument at least fifteen years ago.

THE LATE RICHARD D. GRAINGER,
ESQ., F.R.S.

RICHARD DUGARD GRAINGER was born in Birmingham in 1801; and was the son of Mr. Edward Grainger, a surgeon of that town. At first it was intended that he should enter the army; and for a time he studied at the Woolwich Military Academy. Circumstances and his inclination, however, led him to medicine; and, having joined his elder brother Edward, a surgeon of great promise, who had successfully established a private anatomical school at Webb Street in the Borough, he succeeded him, at the early age of 22, in the management of the school, in which he held the anatomical chair. During nearly twenty years he maintained the usefulness and popularity of the institution; until, in 1842, when the private schools were rapidly waning before those attached to hospitals, he amalgamated the Webb Street school with that of St. Thomas's Hospital, in which he became lecturer on Anatomy and Physiology—an office which he held until 1860. On his retirement, his friends and pupils were desirous of presenting him with a testimonial. This, however, he declined, desiring that the contributions might be applied to the formation of a physiological prize at the medical school of the hospital. An address, expressing the high estimation in which he was held, and the value entertained of his scientific labours, was presented to him.

Mr. Grainger was a zealous prosecutor of anatomical and physiological research. The nervous system was a principal object of his investigations; and, in 1837, he published a work on the *Structure and Functions of the Spinal Cord*, and soon afterwards obtained the Fellowship of the Royal Society. At the time when Dr. Marshall Hall was carrying on his researches on the nervous system, the independent labours of Mr. Grainger contributed much to the solution of some of the difficult problems that were raised. He also devoted considerable attention to the study of developmental anatomy.

When sanitary and social reforms began to be publicly advocated in this country, amid but cold encouragement, Mr. Grainger was one of the first to attach himself zealously to the good cause; and to it he held throughout his life. In 1841, on the appointment of the "Children's Employment Commission", he was nominated one of the inspectors; and the ability and discretion with which he discharged the duties of his office were testified to in 1862, when he was appointed one of the members of a second commission bearing the same name. In 1849, he was appointed, by the then existing Board of Health, one of the inspectors to inquire into the origin and spread of cholera; and in 1853 he was selected as one of the inspectors for carrying out the Burials Act. This latter office he held up to the time of his death. To him also is due the formation of a society for the protection and succour of young women employed in milliners' and dressmakers' establishments.

In 1845, Mr. Grainger was elected a member of the Council of the Royal College of Surgeons; and in 1848 he delivered the Hunterian Oration. His subject was, "The Cultivation of Organic Science"; and in his oration he dwelt chiefly on "the importance of recognising the triple combination of design, unity, and law" in all researches on structure or function.

In person, Mr. Grainger was tall and of spare form, with an habitual stoop; his forehead was high and expanded, and his eye bright and quick, showing a man of superior intellect and culture. In manner he was courteous, quiet, and retiring; but, having once entered on conversation, he was lively, energetic, and earnest, impressing his hearers with a feeling that he was thoroughly convinced of the truth of what he desired to teach. These characteristics marked also his lectures and public addresses, causing them indeed to appear somewhat slow and laboured, but at the same time imparting to them a degree of eloquence. He was an ardent admirer of natural science, in the prosecution of which he was constantly ready to find proofs of the wisdom and goodness of the Creator. Of decided opinions and deep convictions, he was charitable and tolerant towards those who differed from him; but towards the untruthful and selfish he did not spare his expressions of indignation and scorn. In the discussion of scientific or philanthropic questions, he was ever ready to acknowledge merit in the humblest fellow-worker; and his liberality to the destitute and struggling among his profession was bounded only by his means. Helpless misery and woe called forth his deepest sympathy, and gave him unfeigned pain.

He was not only a searcher after scientific truth, but devoted much of his time to the study of the Bible. On the teachings of Christianity his character was founded; and the convictions at which he had arrived were truly and eloquently expressed in his peroration to the Hunterian address:—"We must turn to the sacred volume of revelation, wherein we shall discover laws as perfect and principles as fixed, for the guidance of the spiritual nature of man, as those which rule the phenomena of the material world—where, in fine, aided by the Divine grace, and prepared by a fitting humility, each and every one of us may hope to come to that 'true light which lighteth every man that cometh into the world.'" He took an active interest in the Christian Medical Association, before which he delivered several simple but earnest addresses. He was anxious that those who are entering on the study of medicine should feel that the claims of revealed truth, though superior, are not antagonistic to those of scientific truth.

Mr. Grainger's health was never very robust; and five years ago, on his consulting his friend Dr. Risdon Bennett on account of dyspeptic symptoms, it was found that he was suffering from renal disease and albuminuria. The disorder for a time appeared to make but little progress; and the interruptions caused by it were not sufficient altogether to prevent him from pursuing his avocations until a few months before his death. He died on February 1st, aged 63, and was buried at Eltham on the 7th. He leaves a widow, but no children.

[The preceding notes are abridged from a memoir which appeared in the *Medical Times and Gazette* of last week. **ERROR.**]

CARDINAL WISEMAN'S ILLNESS.

OUR readers have lately seen daily accounts in the papers of the illness of Cardinal Wiseman; and may be interested to know what was the nature of the disease which of late so gradually and almost imperceptibly carried him off. It is, we understand, a fact that at least twelve years ago the presence of sugar was discovered in his urine, and ever since then he has been the subject of diabetes. In 1860, his health seriously failed him, and he was seized with symptoms of great prostration and weakness of the heart. He also, at this time, was troubled with carbuncles; but, after a journey to Rome, was gradually restored to something of his previous state under the care of his ordinary medical adviser, Mr. Charles Hawkins. Shortly before last Christmas, he discovered two "blisters" on his foot. These blisters were, in fact, signs of his weak circulation; and, eventually, the surface of the skin where affected sloughed. The sloughs, under a nourishing diet, completely healed; but signs of general prostration supervened. He felt himself that he was very seriously ill; and for many hours during one particular night was insensible, and was restored apparently by the abundant administration of stimulants. His pulse was slow, and very weak; but no signs of any organic disease of any organ of his body could be diagnosed. His death, in truth, seemed to be brought about by a very slow failure of his weakened heart. Shortly before his death, he was again attacked by erysipelas of the head and face, followed by the formation of a carbuncle on the forehead.

The Cardinal died in his sixty-second year. It is curious to note that, when he was quite a young man, he was copiously bled in Rome for "consumption", as it was alleged; and that it is thought his life was then saved by his having been carried off from the hands of the Italian doctors by some English friends.

One interesting fact may be added, and it is this: that no attention has been paid by him to following out what may be called a diabetic diet. He has, we believe, all along lived as a person not affected with the disease. In his case, therefore, the advantages of a strict and painful diabetic diet are not illustrated.

No *post mortem* examination was made; but it was, we understand, distinctly ascertained by Mr. Charles Hawkins, Dr. Munk, and his other medical attendants, that, up to the very time of his death, neither his lungs nor any of the organs of his body showed any deviation from health, except in the way above spoken of.

DR. DEMMÉ, concerned in the Trumpy-Demmé tragedy, is Dr. Hermann Demmé the author of a work on military surgery, for which he collected the material during the late Italian war. He has, besides, written an essay on Osteomyelitis, part of which appeared in the columns of this journal, translated by Dr. Bauer, of Brooklyn. (*Phil. Med. and Sur. Rep.*)

BRANCH MEETING TO BE HELD.

NAME OF BRANCH.	PLACE OF MEETING.	DATE.
NORTH WALES. [Intermediate.]	Dr. Roberts's, Hafod Elwy, St. Asaph.	Friday, February 24, 1 P.M.

MEDICAL PROVIDENT SOCIETY.

THE following contributions have been made towards the Auxiliary Fund.

	£.	s.	d.
Amount already announced	615	12	0
<i>Bedfordshire:</i>			
H. Veasey, Esq. (Woburn), additional	5	5	0
<i>Devonshire:</i>			
Plymouth Medical Society (per Dr. Cookworthy, Treasurer)	10	0	0
<i>Lancashire:</i>			
Dr. Desmond (Liverpool)	3	3	0
Dr. Dickinson (Liverpool)	5	0	0
T. Howitt, Esq. (Lancaster)	5	5	0
W. McCheane, Esq. (Liverpool)	1	1	0
W. H. Manifold, Esq. (Liverpool)	1	1	0
<i>Middlesex:</i>			
Dr. E. S. Willett (Isleworth)	1	1	0
<i>Shropshire:</i>			
Samuel Wood, Esq. (Shrewsbury)	5	0	0
<i>Suffolk:</i>			
W. E. Inage, Esq. (Bury St. Edmunds)	5	5	0
<i>Wales:</i>			
Dr. Dyster (Teuby)	10	10	0

Further contributions will be announced.

Gentlemen desirous of contributing to the Auxiliary Fund, will oblige by forwarding their names and the amount of their donations, either to the Chairman (Dr. Richardson, 12, Hinde Street, Manchester Square, W.); or to the Secretary (Dr. Henry, 15, George Street, Portman Square, W.)

B. W. RICHARDSON, M.D., *Chairman.*

ALEXANDER HENRY, M.D., *Secretary.*

London, 18th February, 1865.

BIRMINGHAM AND MIDLAND COUNTIES
BRANCH: ORDINARY MEETING.

An ordinary meeting of this Branch was held Feb. 9th; JAMES RUSSELL, M.D., President-elect, in the chair. Fifteen members were also present.

Paper. The following paper was read:

Two Cases of Obstructed Labour. By S. Berry, Esq. Mr. Clay, Dr. Earle, and Messrs. Yates and Downes, took part in the discussion.

New Members. The following gentlemen were elected members of the Branch: John Bassett, Esq., Hockley; J. D. Scurrah, M.D., Birmingham; T. Birt, M.D., Leamington; G. E. Hyde, Esq., Worcester.

THE LATE DUKE OF NORTHUMBERLAND was a Fellow of the Royal Society, of the Society of Antiquaries, of the Royal Geographical Society, and a member of the Royal Astronomical and other learned societies. He was also a munificent supporter of many of our charitable institutions; was president of the Westminster and Middlesex Hospitals, vice-patron of Charing Cross Hospital, president of the Seamen's Hospital Society, president of the Westminster General Dispensary, vice-president of the Royal Humane Society. His Grace was also president of the Royal United Service Institution, president of the Royal Institution of Great Britain, a director of the British Institution, and a trustee of the British Museum.

Reports of Societies.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

TUESDAY, JANUARY 24TH, 1865.

W. R. BASHAM, M.D., Vice-President, in the Chair.

CONTRIBUTION TO THE NATURAL HISTORY OF "WINTER COUGH." BY HORACE DOBELL, M.D.

THIS paper was an analysis of fifty-eight cases of "winter cough," the details of which were given in an appendix. The cases were arranged in four groups, according to the physical signs:—

1. Cases in which there were physical signs both of bronchitis and of emphysema.
2. Cases in which there were physical signs of bronchitis, but not of emphysema.
3. Cases in which there were physical signs of emphysema, but not of bronchitis, and in which there was no history of previous bronchitis.
4. Cases in which there were physical signs of emphysema and not of bronchitis, but in which there was a history of previous bronchitis.

Each case was reported in the form of answers to a set of forty-one questions relating to the short breath, the cough, the taking of colds, the past illnesses, the occupation, the dwelling, the food, the habits, and the family history of the patient, in addition to a concise statement of the personal condition at the time of examination. The number of facts thus collected was too numerous to admit of their being discussed within the limits of a paper; the author therefore restricted himself to an analysis of the cases under the several groups, and a comparison of some of the principal facts in a series of twenty tables, thus putting the materials into a convenient form for future use.

DR. SALTER questioned the appropriateness of the words "natural history" in the title of the paper. He thought nothing was gained by removing the ordinarily received landmarks of a vocabulary by taking up a word and transplanting it into a position not its own, and that nothing tended so much to weaken and impoverish the resources of a language as attempting to expand the use of words too far. By "natural history" was generally understood the history of organised beings, animal and vegetable. No doubt the study of disease was the study of a department of nature; but if the use of the expression "natural history" was defended on this ground, it would be as appropriate to speak of the natural history of astronomical or any other natural phenomena. The point on which the paper seemed to promise to throw some light was the causation of emphysema; but in this it had disappointed him. The only case that really bore on the subject was the single case in which emphysema was said to have existed without bronchitis; but he could not conceive that bronchitis really was absent in this case. Emphysema with cough and without bronchitis he could understand; but emphysema with *winter* cough and without bronchitis he could not understand: the bronchitis might be very feebly pronounced, but he did not believe in any non-bronchitic winter cough. While containing much that was interesting, and suggestive of many hints for future useful work, he thought the paper suffered a great disadvantage from being so entirely a paper of figures. And he thought, too, that it very well illustrated what had been often said of figures—that they could be made to prove anything. Take, for example, the fact stated by the author—that pa-

tients with emphysema had bad spirits, while those with bronchitis had good; and his explanation—that this difference depended on the presence of expectoration in the one case and its absence in the other. He (Dr. Salter) thought that this statistical evidence of the exhilarating tendency of expectoration was a strong proof of the omnipotence of figures. He differed from the author in the little importance he assigned to occupation in the causation of winter cough; he (Dr. Salter) found it the most potent of all circumstances in the production of the affection. By far the larger proportion of sufferers from it who came under his observation were those whose occupation exposed them to all weathers, and at the same time prevented their lying by—such as vendors of things in the streets, cabmen, porters in Covent Garden Market, etc. Indeed, the fact that the disease was due to climatic influences was itself a proof that those whose occupations the most exposed them to those influences must be the greatest sufferers. He quite agreed with the author as to the undefined use of the word "asthma"; that a great many cases of so-called asthma were simply chronic bronchitis; and that any chronic difficult breathing is commonly called asthma. At the same time, he thought that a carefully directed inquiry would generally detect whether such cases were truly asthmatic or not.

DR. DOBELL thanked the Society for listening so patiently to his very dry paper. He had hesitated to bring it before them because of the number of tables and calculations which it contained. He was much obliged to Dr. Salter for his suggestions about the term "natural history" used in the title; but he entirely disagreed with him. When treating of animals or plants, the term "natural history" was used to comprise a description of the "conditions of their existence"; the circumstances influencing their development, maintenance, growth, and reproduction; their habitats, habits, and the like. It was precisely this kind of information which he had collected with regard to "winter cough"; and he must, therefore, maintain that it was correct to call it "natural history." With regard to occupation, he entirely agreed with Dr. Salter that the influence of occupation on winter cough was of the greatest importance. Dr. Salter had simply misunderstood the words of the paper. It was there stated that, as there were only fifty-eight patients, and as they followed twenty-eight different sorts of occupation, no more than seven following any one of these, it would not be fair to draw any conclusion as to the influence of occupation on the disease from the tables, but that, as a correct record of facts, it would become valuable when added to others of a similar kind. With regard to the whole paper, he (Dr. Dobell) wished particularly to impress that, as it only treated of fifty-eight cases, broken up into four groups, and as each case necessarily differed to some extent from the rest, he did not consider that it ought to be taken as a safe basis for general conclusions respecting such an important and widely-spread class of diseases. He had scrupulously abstained from making such conclusions, and he hoped that others would do the same. The title described the paper as no more than a "contribution" towards a natural history, and he did not wish it to be considered as more than it assumed to be.

ON SEA-SICKNESS AS A FORM OF HYPERÆSTHESIA.

BY JULIUS ALTHAUS, M.D.

MOST writers on sea-sickness consider this affection to be due to hyperæmia of the brain and spinal cord, or to a morbid condition of the gastric nerves. The object of this paper was to show that sea-sickness was in reality, caused by anæmia of the brain and the

cervical portion of the spinal cord, arising from insufficient power of the heart, whereby a general increase of reflex excitability throughout the system was brought about. The first and most constant symptom of the disorder was not retching or vomiting, but vertigo, which was most severe in the standing posture, and at once relieved by a strictly horizontal position, and which was thus proved to arise from a deficient amount of blood in the nervous centres. The increase of reflex excitability was also shown by greater sensitiveness of the patient to light, sound, touch, etc.; and in some cases there were even reflected spasms in the lower extremities. It was, however, greatest in the stomach, as evidenced by retching and vomiting, the degree of which was dependent upon the posture of the patient, but not upon the full or empty condition of the stomach, or its greater or less vital power. This increase of excitability was after a time, generally followed by a considerable diminution of it, there being great torpor and profound indifference. The organ primarily disturbed, therefore, appeared to be the heart, which, in consequence of the ship's motions, became unable to propel the blood with sufficient power into the nervous centres. The blood was accumulated in the chest and the abdomen, where it produced a feeling of pressure and heat. Persons with a strong heart and a slow pulse generally suffered little from sea-sickness; while irritable people, with a quick pulse and a tendency to palpitations, were more liable to be affected. This explained to a certain extent the different liability to sea-sickness of the different nations; for, as a rule, the French and Italians, being of a more irritable temper, suffered most, the Germans less, and the English least, of the disorder.

The treatment of sea-sickness flowed directly from the pathology enunciated. Our task should be to facilitate the afflux of blood to the nervous centres, and to strengthen the heart's action. For this purpose a horizontal position should be enjoined, and a few tablespoonfuls of well-seasoned beef-tea, and small doses of brandy, should occasionally be given.

FEVER IN GREENOCK. A serious and fatal epidemic of fever has been of late present in Greenock. Its nature may be judged of from the fact that, since November, no less than four medical men have died from it there, and all of them young and in the prime of life.

DEATHS IN LONDON. During past week, in London, fourteen infants died from being overlaid or otherwise suffocated in bed. A man was killed by a cart. Mr. Yardley, Registrar of St. George's, Bloomsbury, who records eighteen deaths in the week, of which eight were in the Infant Home, 35, Great Coram Street, an institution for illegitimate children, states that the mortality in this house continues to be very great; and that Dr. Buchanan, the medical officer of St. Giles's district, having visited it, made suggestions to the principal of the establishment, which have been carried out, and, amongst others, that the resident medical officer of the Sick Children's Hospital should visit it daily, in addition to the visits of the regular surgeon of the Home, which are made three times a week; but the children are generally so weak and emaciated from want of nourishment and attention previously to admission, that the mortality of the inmates is inevitably high, and it is only by the greatest care that any considerable number of them can be saved. The rate of mortality was 27 per 1000 in London, 28 in Edinburgh, and 34 in Dublin; 45 Liverpool, 35 in Manchester, 35 in Salford, 26 in Birmingham, 34 in Leeds, 28 in Bristol, and 41 in Glasgow.

Correspondence.

SYPHILISATION.

LETTER FROM HENRY LEE, ESQ.

SIR,—Professor Simpson has, in a very friendly manner, furnished me with the means of identifying the case he mentions in your impression of last week as the same as the one to which I had previously referred.

It is now admitted that that patient had no constitutional symptoms for six years after the appearance of the supposed primary affection; and that he had at no time any eruption upon the skin. Professor Simpson has attempted to show that the case might nevertheless be one of syphilis, by quoting passages from Dr. Bumstead and Professor Gross, to the effect that sometimes "tertiary symptoms manifest themselves for the first time from twelve to eighteen years after the primary disease"; and, in the clever way in which Professor Simpson has put it, an ordinary reader might be led to suppose that the authors mentioned believed that constitutional symptoms, in real cases of syphilis, might not appear until after that lapse of time. A fallacy underlies Professor Simpson's whole argument.

It is true that Dr. Bumstead says we meet with some "instances in which syphilis appears to skip over its secondary, and manifest itself only in its primary and tertiary forms." But he also states that "the general symptoms of syphilis, in the absence of specific treatment, *always* appear within six months, and generally within three months, after infection."

Dr. Gross says very much the same thing; and Ricord has printed his opinion upon the subject in very large letters; namely, that, in the natural development of the disease, "*IL NE PASSE JAMAIS SIX MOIS SANS QU'IL SURVIENNE DES MANIFESTATIONS DE L'INTOXICATION SYPHILITIQUE.*" (*Lettres sur la Syphilis*, p. 300.) I must add, that the opinion here expressed agrees with my own experience.

It is then evident that, when authors mention the tertiary symptoms as appearing after the lapse of some years, the "tertiary" are put in opposition to the "secondary" symptoms, which have previously appeared at their natural time. Such a case I well recollect, where an eruption appeared after the lapse of twenty years; but in this, as in other similar cases, the secondary symptoms had first manifested themselves at their usual time.

There are other reasons, such as the absence of any history of an indurated chancre and of any chronic indolent enlargement of the glands, which induce me to believe that the disease under which the patient in question was suffering was not syphilitic. I was of that opinion when the patient was first sent to me for a written opinion on his case; I was of the same opinion when I read the case reported in the *BRITISH MEDICAL JOURNAL*; and I am of the same opinion now that I have read Professor Simpson's comments upon it.

If, on the contrary, Professor Simpson has indeed made out that constitutional symptoms may appear for the first time after a lapse of six years, it is he who has made a great "discovery". For myself, I must disclaim having maintained the "marvellous marvel", that softening of the bones could be cured by syphilisation, especially in the instance before us; seeing that it was the father who had the "softening of the bones", and the son who was (as it is termed) syphilised.

In the third paragraph of his letter, Professor Simpson implies that I am anxious to reject the case in question only because it was completely cured (?) by syphilisation. Whatever opinion I may now entertain with regard to the virtues of syphilisation, I certainly had no prejudice against it originally, and have published a plate in my work on *Syphilis*, illustrating the appearances of the inoculations in a case in which I had tried it.

Mr. friend Dr. Marston informs me that he has also lately carried it to the extent of some forty to sixty inoculations, but with no benefit to the disease for which it was tried, and with a certain amount of damage to the patient's constitution.

When these experiments are tried on those who are already syphilitic, and who are provided for in military hospitals, no great harm can probably follow. But, holding the views I do, your readers will not be surprised if I should exert what little influence I may have to prevent the young men of our country from leaving their homes to be syphylised with matter taken indiscriminately from hard and soft sores, where there is any chance of their having a disease communicated to them which they had not before.

I am, etc., HENRY LEE.

9, Savile Row, February 12th, 1865.

ADVICE GRATIS "AT HOME."

LETTER FROM HENRY LOWNDES, ESQ.

SIR,—On the question of the gratuitous services of hospital surgeons I am compelled sometimes to differ from you, as I think both the charities and the profession gain by the medical officers being an associate rather than a servant of the committee or governing body. But I had the greatest pleasure in reading your remarks on private gratuitous advice.

In this town this system is carried on to a considerable extent, and that even by gentlemen who profess, and I believe honestly, to have the welfare of the profession at heart. I believe—and I shall be glad to be put right if wrong—that at least five-sixths of these gratuitous patients bring as introductions notes from druggists who have been tampering, as far as they dare, with the case; and to these druggists they of course return with their prescriptions until such a change takes place as will either require a certificate or allow the patient to swallow the druggists' own prescriptions in comparative safety. Of course, respectable druggists do not do these things, but the very system of gratuitous advice has, I believe, led to the existence of a class of shops that could not be otherwise maintained.

Any one who knows not how easy it is to poison a child, but how difficult it is sometimes not to do so, can imagine how much of our excessive infant mortality this system may account for. Those who by keeping open house support this system, are not indeed perhaps morally guilty of murder, but they are accessory to this wholesale slaughter.

The injury the system inflicts on young and struggling medical men is manifest. Those who have got past their early struggles are often greatly annoyed by finding that their patients who could well afford, if necessary, a consultation fee, run off in secret to have a gratuitous interview with some great doctor who declares the oracles. I hope abler pens than mine will take this matter up, and that the profession will not rest until this system is at least reformed.

I am, etc.,

HENRY LOWNDES.

Liverpool, February 11th, 1865.

Medical News.

ROYAL COLLEGE OF SURGEONS OF ENGLAND. The following members of the College, having undergone the necessary examinations, were admitted Licentiates in Midwifery at a meeting of the Board, on February 8th, 1865.

Clements, George, Brixham, Devon: diploma of membership dated January 21, 1865
 Dillon, Patrick William, Ennis, co. Clare: July 11, 1851
 Douglas, George Cox, Ware, Herts: May 24, 1864
 Dwelly, Henry James, Waudsworth: July 26, 1864
 Hatherly, Henry Reginald, Derby: November 16, 1864
 Hyde, Edward, Witney, Oxon: July 30, 1863
 Jones, William Owen, Bala, North Wales: August 1, 1861
 Purcell, Ferdinand Albert, Cork: January 26, 1865
 Roberts, John Coryton, Peckham: July 26, 1864
 Rogers, Charles Edward Heron, West Meon, Petersfield: July 27, 1864
 Smith, Edward Roberts, Dudley, Worcestershire: May 24, 1864
 Smith, Walter, Bognor, Sussex: May 11, 1864
 Stone, William Domett, Lincoln's Inn Fields: April 10, 1861
 Williams, Hutchins, Southampton: May 27, 1853

ROYAL COLLEGE OF SURGEONS, EDINBURGH. During the recent sittings of the examiners, the following gentlemen passed their final examinations, and obtained the diploma of the College.

Clendinnen, William Ellis, county Wicklow
 Higgins, Thomas James, Lisson
 Hoggan, Edward, Meerut, India
 Ingram, James, Orkney
 Jamieson, Alexander Wallace, Derbyshire
 Mason, James, Rutlandshire
 Thin, Robert, Kilconquhar

ROYAL COLLEGES OF PHYSICIANS AND SURGEONS, EDINBURGH. (Double Qualification.) The following gentlemen passed their first professional examinations during the recent sittings of the examiners.

Budge, John T., Caithness
 Coppinger, Albert W., Cork
 Goulden, James Henry Oswald, Stockport
 Leman, J., Montreal
 Mason, James Lindsay, Montreal
 Roche, Arthur, Cork
 Stewart, Robert, Edinburgh
 Thompson, William G. W., Ballymoney
 Witherspoon, John Thompson Richardson, Dumfriesshire

And the following gentlemen passed their final examinations, and were admitted L.R.C.P. Edinburgh, and L.R.C.S. Edinburgh.

Beresford, Robert, Dublin
 Dods, James, East Lothian
 Forbes, Daniel Mackay, Edinburgh
 Hague, Samuel, Ashton-under-Lyne
 Miller, Alexander Hunter, Edinburgh
 Turner, Robert, Antrim

APOTHECARIES' HALL. On February 9th, 1865, the following Licentiates were admitted:—

Boulton, Edward Farrington, Bath
 Mackenzie, George Weiland, Tiverton, Devon
 Mason, James, Barrowden, Rutlandshire
 Roberts, John, Festiniog, Merionethshire
 Rogers, Charles Edward Heron, West Meon, near Petersfield
 Tuck, Francis, Oxford
 Watta, Arthur John, Alfred Street, Harrow Road

At the same Court, the following passed the first examination:—

Barton, Frederick, University College Hospital
 Croft, Gilmore Winton, St. Thomas's Hospital
 Withers, Walter Owen, King's College Hospital

APPOINTMENTS.

DELL, Joseph, M.D., appointed Assistant-Surgeon in the Surgical Clinical Wards of the Royal Infirmary of Edinburgh.

ROYAL NAVY.

CLIFT, Samuel, Esq., Surgeon, to the *Rattlesnake*.
 JACKSON, Gordon, Esq., Surgeon (additional), to the *Asia*, for service in the *Enchantress*.

VOLUNTEERS, (A.V.=Artillery Volunteers; R.V.=Rifle Volunteers):—

CLARK, W. W., M.D., to be Honorary Assistant-Surgeon 7th Northamptonshire R.V.
HARRIS, C. M.D., to be Honorary Assistant-Surgeon 9th Cinque Ports R.V.

BIRTH.

MARTYN. On February 13th, at Clifton, the wife of *Samuel Martyn, M.D., of a daughter.

DEATHS.

ADAMS, George Hill, M.D., at Mall Terrace, Notting Hill, on Feb. 6.
BARLOW. On February 4th, at Writtle, Essex, Eleanor Stausfield, second daughter of William R. Barlow, Esq., Surgeon.
GRAINGER, Richard D., Esq., F.R.S., at Highgate, aged 63, on February 11.
GULL. On February 8, at 26, Brook Street, aged 3 years and 10 months, Mary Dacre, youngest child of W. W. Gull, M.D.
HALL. On January 14, in London, Eliza, youngest daughter of Thomas Hall, Esq., Surgeon.
LOWE, William, Esq., Surgeon, at Warboys, aged 60, on February 8.
MACMONT, Robert, M.D., at Bath, on February 8.
NICOLAS, Thomas, M.D., at Portland, aged 41, on January 27.
RALEIGH, Edward W. W., Esq., late Bengal Medical Service, aged 62, on January 22.
SCOT. At Farnborough, Hants, lately, aged 78, Helen Goldie, widow of William Scot, Esq., late Superintending Surgeon at Madras.
WALES. On February 14th, at Downham Market, aged 71, Mary, the wife of *Thomas Garneys Wales, Esq.
WAYELL, Robert M., M.D., at Newport, Isle of Wight, aged 66, on February 8.
WELCH. On February 14, at Taunton, aged 83, Mary, widow of the late Charles Welch, Esq., Surgeon.

CANDLER v. PEAT. One hundred pounds have been subscribed and given to Mr. Peat to help in defraying the expenses incurred by him in the action of Candler v. Peat.

SMALLPOX IN DUBLIN. The ages of the persons whose deaths from smallpox were registered during the past week in Dublin were respectively 9, 10, and 22 years; none of them had been protected by vaccination.

BEQUEST. By will George Dodd, Esq., late of Grosvenor Place, leaves the following charitable bequests: To the Royal Institution, the Artists' Benevolent Fund, St. George's Hospital, Middlesex Hospital, and Lock Hospital, each £100.

KNIGHTHOOD OF DR. A. TAYLOR. The Queen has been pleased to direct letters patent to be passed under the Great Seal granting the dignity of a Knight of the United Kingdom of Great Britain and Ireland unto Alexander Taylor, Esq., Doctor of Medicine.

MR. CHARLES HAWKINS has been unanimously elected (by ballot) treasurer of St. George's Hospital, in place of the late Sir A. Croft. This is, we believe, the first time that a medical man has been appointed to the post of honour; and is a sure indication of the high esteem felt for Mr. Hawkins by the governors of the hospital.

SUICIDE OF VICTOR TOWNLEY. Victor Townley, the murderer of Miss Goodwin, destroyed himself on Sunday afternoon by jumping over the staircase railings in Pentonville Prison, on his return from chapel. He received a concussion of the brain, and died in a state of unconsciousness at eight o'clock the same evening.

THE SANITARY CONDITION OF CALCUTTA. On Tuesday last, Mr. Vansittart asked the Secretary of State for India whether anything had been done to improve the sanitary state of Calcutta; if so, whether he had any objection to produce papers relating to the same? Sir C. Wood said that a sanitary commission was appointed and made a report, but he had not received a report of what had been done in consequence of that report.

SOMETHING LIKE AN APPETITE. The *Patria* of Naples states that there is at present in the Hospital of Incurables in that city an old woman who is suffering from a strange disease. She every day eats at least five portions of roast meat, seventy eggs, several loaves, and other food, of course including a good quantity of macaroni. When attempts are made to reduce her diet she raves like a mad woman. Professor Zamoglia has recently undertaken to cure the poor woman, but up to the present time her appetite remains unimpaired.

CHILDRED DIET. Before summing up these few remarks, says Dr. Patterson, let me add my humble testimony to the good effects of a more supporting diet after childbirth, as for a series of years past I have enjoined and ordered a pretty liberal diet, especially in great exhaustion from uterine hæmorrhage after severe labour; and instead of harm, much benefit was derived by the patient after delivery. I am convinced that by this means recoveries will be less tedious and far more satisfactory, than under the frugal bill of fare which in such cases is usually prescribed. (*Glasgow Medical Journal*.)

POOR-LAW UNION MEDICAL OFFICERS. In the House of Commons, on Tuesday, Mr. R. Long asked the President of the Poor-Law Board whether he proposed to reappoint the select committee on the poor laws, with the view of further inquiry into the position and the grievances of medical officers of poor-law unions. Mr. Villiers said it was not his intention to move the reappointment of a committee of inquiry on this subject. It was investigated by the committee referred to by the hon. gentleman who took into their consideration the evidence given before a committee of the house, and declined to call further evidence.

ANOTHER VICTIM TO THE POOR LAWS. It is with feelings of pain that we find ourselves called upon to announce the death of another member of the medical faculty, by fever contracted in the discharge of his professional duties. Dr. Cæsar, jun., has, like Mr. George Fitton, succumbed to fever. We understand that his death is indirectly traceable to the hardships he has had to encounter while acting as medical attendant at the Auxiliary Fever Hospital instituted by the Board of Guardians. While his attendance was required at the hospital throughout the whole day, he was not allowed even a chair to sit on. Although we have the information from reliable authority, we can scarcely believe it, and we hope it may be found to be exaggerated. We cannot, however, forget that it was sought by some of the guardians to require his attendance by night as well as by day, and that such a course would have been attempted but for the outspoken manner in which Dr. William Townsend showed the inhumanity of requiring more service than they had been receiving. The deceased took fever at the Auxiliary Fever Hospital, and was removed to the North Fever Hospital, where he died, after an illness of fifteen days. It cannot be expected that medical men, whose education costs a large sum of money, and requires the application of several years, will be got to put their lives in jeopardy for the miserable stipend of two guineas a week, which the guardians have been rather grudgingly paying. We cannot repress the thought that the parsimony of the guardians, respecting the management of the fever hospital, has been productive of loss of life, and we think the death of Dr. Cæsar an event for which they ought to show their sorrow by cringing, for the future, a more humane spirit towards the members of this very useful, but insufficiently appreciated profession. (*Cork Reporter*.)

THE ARMY ACTING ASSISTANT-SURGEONS. A recent number of the *London Gazette* contains the announcement that the undermentioned acting assistant-surgeons have ceased to do duty, there being no longer occasion for their services:—W. E. Bower, J. G. Campbell, P. Lee, J. Craven, F. P. Beamish, M.D., R. E. Hogan, T. Hunt, R. P. Gelston, W. Haynes, M.D., T. P. Tyrrell, J. T. B. Lawrie, M.D., R. Wallace, W. K. Brock, J. R. Roe, E. A. Keogh, M.D., J. B. Gaffney, W. Durrant, J. A. Gaven, R. FitzGerald, A. Mulcahy, W. F. Fenton, W. Adams. This list, we believe, comprises the whole of the recently appointed "acting assistant-surgeons."

A HOMEOPATHIC CONVERT. The *Jersey Times* of last week has the following:—"A Disagreeable Surprise. At a recent complimentary public dinner given by his professional brethren to Dr. Thomas, the eminent surgeon to the Staffordshire County Hospital at Wolverhampton, the recipient of this honour is reported to have stated in his acknowledgment of the toast of the evening that he had instituted a long and careful inquiry into the nature and value of homeopathy, and had found its principles and practice to be so unequivocally true and reliable, and, above all, so extremely effective in the treatment of disease, that he had firmly resolved to devote the remainder of his life to their propagation and support. Dr. Thomas is a graduate, with honours, at the University of London, a member of the College and Hall, and a gold medallist both in anatomy and medicine of London University, Longridge prizeman of University College also, and, prior to his appointment of surgeon to the Staffordshire County Hospital at Wolverhampton, was demonstrator of anatomy in the University College Medical School. (*Liverpool Weekly Mercury*, December 31st, 1864.)"

JOTTINGS FROM REGISTRARS' NOTES. The reports transmitted to the Registrar-General by the local registrars on the state of their districts during the last quarter of 1864 contain the following among other statements:—St. Martin's, Birmingham—"Smallpox has been very prevalent; vaccination is frequently disregarded; there is no local medical officer of health in the town." Worcester, West—"Small-pox is very prevalent; none of the persons who died were vaccinated." Scarborough—"43 deaths from small-pox; not one of the victims, so far as I can ascertain, had been vaccinated." Exeter, St. Sidwell—"Scarlatina and smallpox are very prevalent; not more than one-third of the children are vaccinated." St. Helen's—"Smallpox is most prevalent in that part of the town noted for its defective sanitary arrangements, and inhabited principally by the Irish; there is an entire absence, apparently, of all ideas of cleanliness." Yeovil—"Several deaths have occurred from typhoid fever; the drainage is in a very bad state." Blyth—"Nineteen deaths from typhoid fever, 11 of them occurring in Newsham and Forster Pit districts, which are deficient in sanitary arrangements and a proper supply of water." Oswaldtwistle, Lancashire—"Upwards of 300 persons have been attacked by typhoid fever during the quarter; the medical men attribute the great prevalence of the disease to bad drainage." Orsett, Essex—"Fever of a typhoid character has prevailed; cases of this kind were sent into the workhouse, and in spite of all precautions the disease spread." Wiveliscombe, Somerset—"The excess of deaths is caused by scarlatina existing as a wide-spread epidemic; medical men are rarely called to treat this disease in its early stages by the poor and middle class." Ely—"There were 23 deaths in town from scarlatina, and only one in the fens." Mutford, Lowestoft—"A woman died aged 104 years; her faculties appeared unimpaired until the last."

Acton—"Among the deaths is that of a child found dead in the Church Road, the sex of which is returned by the coroner's 'information' as being both male and female."

LEARNED LUNATICS. At a trial last month before the City Court of Brooklyn, New York, in which the plaintiff claimed a verdict and damages against her brother and nephew for taking her to Bloomingdale Lunatic Asylum, though she was (she alleged) really of sound mind, Dr. Brown, the principal physician of the asylum, was asked whether it was not possible that a person of insane mind could write such poems as this lady had written, one of which had become very popular. The doctor's answer was,—"Certainly. I suppose the best reply I can give to that question is to state that *Adler's German and English Dictionary*, which is used as a standard text-book in the principal colleges in the country, was written in the Bloomingdale Asylum by a person of insane mind. I might also mention a number of standard text-books which were written in that institution; and I will state as a conclusive fact that one of the leading newspapers in New York is principally edited in the Bloomingdale Lunatic Asylum, and the leading editorial is written three or four times a week by a person of unsound mind confined in that institution."

SUPERANNUATION OF MEDICAL OFFICERS. We would be glad that the superannuation fund of all workhouse officials were placed on the Consolidated Fund, as has been done with the officers of the civil service. We know of no learned profession so trying, and, at the same time, so inadequately rewarded, as that of the medical practitioner. He comes daily into contact with scenes of misery and suffering, and the wretchedness he sees must, if he be not possessed of a breast of stone, urge him, in many instances, to bestow more than he can, perhaps, afford to part with. The physician, in the exercise of his profession, becomes acquainted with want in its thousand and one forms. What other professional man endures so much? Putting out of consideration the expense of his education, and the extent of his acquirements, who, in the practice of his business, endures such hardships, and runs such risks. The soldier braves the battle-field; but, happily, wars are not contagious, and he is afforded ample leisure to "shoulder his crutch, and show how fields are won." The clergyman attends at the bedside of the sick to administer religious consolation. But his functions cease when consciousness is overwhelmed by contagious disease. The physician is called on to be most active and attentive, when all other relief is useless, and when danger is most formidable. He is a soldier—daily, hourly facing the cannon's mouth. He is a "ministering angel," when fond friends think more of the cure of the body than of the soul. And yet, how poor is his reward! The number of general practitioners who enjoy an income adequate to the mental wear and tear of their profession is small; while of those whose incomes are small and precarious the name is "legion." (*Southern Rep.*)

THE MARTIN EXHIBITIONS. The subscribers to the fund for establishing exhibitions in the Reigate Grammar School, in memory of the late Mr. Peter Martin, will be glad to learn that, not only have the requisite funds been collected and invested in the names of certain trustees, but that the first examination and distribution has already taken place. There were eight candidates; and on the 27th ultimo, the trustees attended at the school to distribute the awards of £20 and £10 respectively, in the presence of the scholars, to the successful candidates; viz., Gooch, jun., to whom the examiners had assigned the senior, and to Nash the junior exhibition. George Baker, Esq., expressed the great pleasure he had in

handing over to the successful competitors the exhibitions which had been established to the memory of their departed friend whose bust he now saw before him. Mr. Baker spoke of the many excellent qualities of Mr. Peter Martin, who had so greatly endeared himself to a large circle of friends by whom his virtues were cherished. The allusion of Mr. Baker was to a cast of the marble bust executed by the eminent sculptor, Mr. Weekes, R.A., of the late Mr. Peter Martin (presented to the trustees by Thos. Martin, Esq.), which, after the design of one of the trustees of the school, has been placed by Mr. Carruthers in an elegant niche in a conspicuous part of the school. Our readers will be glad to know that not only the profession, but also the public (from whom such subscriptions are highly gratifying) of Reigate and its neighbourhood, have done full justice to the memory of the late Mr. Peter Martin. Besides £1000 set apart for the Exhibition Fund, sufficient money was subscribed to secure a bust in duplicate by Weekes and a memorial window.

REGISTRATION OF BIRTHS AND DEATHS. London has hitherto been the only great city of the world in which the causes of all the deaths and the births have been inquired into, and published weekly. The bills were commenced in the reign of Elizabeth, when thousands of the people were swept away by zymotic diseases; and London was in truth periodically the city of the plague, containing within its walls and liberties a population of only 130,178 souls. The cause of nearly every death is certified by the medical attendants, and the certificates are copied by the 135 registrars, who forward abstracts of their registers weekly, which reach the General Register Office every Monday morning. The population of London was 2,803,989 in 1861. It is no longer decimated by the plague, and it is some years since cholera ravaged its parishes. But the causes of death are numerous, and their operation can only be arrested by a knowledge of the laws which govern death as they govern life. Our knowledge of these laws is likely to be increased by extending the area of observation; and in endeavouring to accomplish this object the Registrar-General has everywhere met with co-operation. The utility of weekly returns is admitted all over Europe. Vienna is at present one of the great medical schools of the age, and from that city the returns are punctually sent to this office every week by Dr. Glatter. Berlin will probably supply the same information. Baron Haussmann, whose efforts to improve Paris are well known, has been communicated with, and he will, with his admirable administrative organisation, have no difficulty in supplying science with the same information about the state of the public health of Paris as is furnished here respecting the health of London. The Registrar-General of Ireland publishes weekly tables for Dublin; and the Registrar-General of Scotland zealously co-operates by procuring returns for Edinburgh and Glasgow. Under these circumstances it has been thought right to procure returns from Liverpool, Manchester, Salford, Birmingham, Leeds, and Bristol, six of the greatest cities or boroughs of England. The returns are furnished by the local registrars, who have laudably aided in the work.

CRIMINAL LUNATICS. These are what they always call themselves, "her Majesty's pleasure people," that is, sentenced to imprisonment during her Majesty's pleasure. Some are reading, some are writing, some playing draughts, a few shambling to and fro in moody silence like caged animals, while some sit staring with blank intensity upon the opposite wall, from which they never move their eyes. Here comes one who was, when at large, more dangerous to her Majesty than Oxford himself, hopelessly

mad from a vain love of notoriety, which he thinks he has attained, as the grand strut with which he enters the room shows clearly enough. The once terrible Captain Johnston is here now, cured to a mild and inoffensive idiotcy; and here, too, is Macnaughten, as really mad as when he killed poor Mr. Drummond. Here is a non-commissioned officer, whose murder of his wife and family some years ago shocked all England. His only anxiety now is about his good conduct medal. Here, too, are several who had already been in asylums before for attempted murder, had been discharged as cured, and having then perpetrated murder outright, have been committed to stay here for evermore. As a rule, those reading are the half-cured, and these seldom speak or are spoken to. Those writing so intensely are generally preparing interminable memorials to the Home Secretary, or keeping the most insane of diaries to show the Commissioners in Lunacy as proofs of their cure and reasons for their discharge. The maddest of all these are those who beset the governors with endless arguments on the necessity for their being set at liberty at once. As a rule, all in this block are harmless, though the prefixes which come attached to their characters and dispositions are not at first sight calculated to convey this mild impression. Thus we find "T. M., murdered his wife and two children; quiet and very harmless. L. F., murdered his wife, sister, and child; obedient, quiet, and perfectly inoffensive." A few who are sane during the greater part of the year are subject to periodical returns of their dangerous maladies. But of the symptoms which precede these outbreaks Dr. Meyer is always a careful observer, and the patients are in good time removed to the "strong block," of which we shall have to speak presently.

ARMY MEDICAL SCHOOL. The following was the examination at the close of the ninth session of the Army Medical School, Netley, between January 30th and February 4th, 1865. The Examiners were Professors Parkes, M.D., Maclean, M.D., Longmore, and Aitken, M.D. *A. Written Questions.* *I. Military Hygiene.* 1. If you were called upon to give your opinion as to the desirability of a certain water-supply, which it was proposed to use for a garrison of five thousand men, what points would lead you to an opinion, firstly, as to the sufficiency of the supply; secondly, as to the purity of the water? 2. If an outbreak of diarrhoea affected suddenly a number of persons in a limited area, what would be the most probable causes? and how would you ascertain the existence of those causes? 3. What are the principal causes which produce movement of air in rooms? and at what rate does movement become perceptible? What are the regulations as regards cubic space per head at home and abroad? and what are the recommendations of the Barrack Commissioners in respect of the quantity of air which should be given per head per hour in barracks? 4. What are the chief diseases which at present cause mortality in the West Indies and the Mauritius? and what are the chief rules of prevention? *II. Military Medicine.* 1. Give as complete an account as you can of the causes which produce (a) typhus, (b) dysentery, and (c) phthisis, in armies. 2. Describe the general and special indications of the treatment in the typhus of armies. 3. Give the causes, symptoms, diagnosis, consequences, and treatment of enlarged spleen. *III. Military Surgery.* 1. Describe the treatment you would adopt on being called to a recent case of gunshot wound of the abdomen, under each of the following six conditions—(a) one opening, without direct evidence whether the projectile has or has not penetrated the cavity of the abdomen; (b) one opening, the cavity being evidently opened, but no complica-

tion being visible; (c) wound penetrating the cavity, complicated with hemorrhage externally; (d) wound with protrusion of the intestine, the intestine itself being unopened; (e) the same, but with intestine opened; and (f) two penetrating wounds, without visible complications. 2. Explain the way in which the eye is enabled to see objects at different distances, and the method by which the range between the nearest and the most distant points of distinct vision may be determined and expressed. Show also how, when presbyopia exists, its degree and the means of correcting it can be ascertained. 3. Give an outline of the surgical duties and of the general arrangements for the care of the sick and wounded under the ordinary circumstances of troops on the march in time of war. iv. *Pathology*. 1. Define what is understood by syphilis. Describe the characters, probable periods of incubation, duration, and consequences, of the various primary venereal sores; and state what kinds of eruptions or sores on the organs of generation may be confounded with venereal sores. 2. Define what is understood by pyæmia and hospital gangrene. Describe the circumstances which tend to induce and propagate the morbid states which these terms comprehend. 3. Describe and interpret the prominent lesions seen in the *post mortem* examination of * * *, who died, aged 23, of chronic dysentery, and was dissected on January 6th, 1865. The points to be attended to in your accounts are as follows: (a) What were the anatomical signs in the small intestine which pointed to the nature of the common continued fever which he was said to have had in Hongkong? State the name of the common continued fever it is probable he had. (b) What were the conditions of the colon and rectum, (c) of the liver, and (d) of the lungs. B. *Practical Examination*. i and ii. Examination, historical account, statement of diagnosis, prognosis, effects of proposed treatment, etc., of one surgical, and one medical case. iii. *Hygiene*. Examination of various specimens of water, for chloride of sodium, for organic matter, and for total hardness. Examination and analysis of specimens of milk and of beer. Microscopic examination of samples of coffee and flour. iv. *Pathology*. Demonstration of the urinary tubuli and cortical portion of a microscopic preparation of a kidney. Description of various preparations of morbid anatomy. Examination of secretions.

MEETINGS OF SOCIETIES DURING THE NEXT WEEK.

MONDAY. Royal College of Surgeons of England, 4 P.M. Professor Huxley, "On the Structure and Classification of the Mammalia."—Medical Society of London, 8.30 P.M. Mr. De Méric, "Clinical Experience in Syphilis."

TUESDAY. Pathological Society of London, 8 P.M.

WEDNESDAY. Royal College of Surgeons of England, 4 P.M. Professor Huxley, "On the Structure and Classification of the Mammalia."—Medical Society of London, 8.30 P.M. Mr. Henry Smith, Lettsomian Lectures on the Surgery of the Rectum. Lecture III, "On the Treatment of Hemorrhoids, and Prolapsus of the Rectum."

FRIDAY. Royal College of Surgeons of England, 4 P.M. Professor Huxley, "On the Structure and Classification of the Mammalia."

COMMUNICATIONS have been received from:—Dr. WILLIAM NEWMAN, Dr. DURHAM; Dr. W. H. O. SANKKY; Mr. FURNEAUX JORDAN; Mr. STONE; Dr. MARTIN; THE HON. SECRETARIES OF THE MEDICAL SOCIETY OF LONDON; Mr. H. LOWNES; Dr. JOHN THOMPSON; Dr. S. W. D. WILLIAMS; Dr. BRUSH; THE HONORARY SECRETARY OF THE HARVEIAN SOCIETY OF LONDON; COLONEL H. M. WALMSLEY; Dr. BEIGEL; Mr. E. BATTY; Mr. OLIVER PEMBERTON; Mr. H. TERRY, JUN.; Dr. SKINNER; Mr. T. PRIDON TRALE, JUN.; Dr. WOODFORD; Mr. BRODIE; Dr. HENRY LEE; Mr. E. BUSH; Dr. JACKSON; Dr. RADFORD; Dr. JAMES RUSSELL; Mr. T. D. JACKSON; Dr. J. BELL; Mr. T. G. WALES, JUN.; Dr. SNOW BECK; Dr. RICHARDSON; Dr. R. FOWLER; Mr. A. RANSOME; and Dr. N. D. MOORE.

OPERATION DAYS AT THE HOSPITALS.

MONDAY.....Metropolitan Free, 2 P.M.—St. Mark's for Fistula and other Diseases of the Rectum, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.
TUESDAY....Guy's, 1½ P.M.—Westminster, 2 P.M.—Royal London Ophthalmic, 11 A.M.
WEDNESDAY...St. Mary's, 1 P.M.—Middlesex, 1 P.M.—University College, 2 P.M.—London, 2 P.M.—Royal London Ophthalmic, 11 A.M.—St. Bartholomew's, 1.30 P.M.
THURSDAY....St. George's, 1 P.M.—Central London Ophthalmic, 1 P.M.—Great Northern, 2 P.M.—London Surgical Home, 2 P.M.—Royal Orthopaedic, 2 P.M.—Royal London Ophthalmic, 11 A.M.

SATURDAY....St. Thomas's, 1 P.M.—St. Bartholomew's, 1.30 P.M.—King's College, 1.30 P.M.—Charing Cross, 2 P.M.—Lock, Clinical Demonstration and Operations, 1 P.M.—Royal Free, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.

TO CORRESPONDENTS.

*. * All letters and communications for the JOURNAL, to be addressed to the EDITOR, 37, Great Queen St., Lincoln's Inn Fields, W.C.

COMMUNICATIONS.—To prevent a not uncommon misconception, we beg to inform our correspondents that, as a rule, all communications which are not returned to their authors, are retained for publication.

CORRESPONDENTS, who wish notice to be taken of their communications, should authenticate them with their names—of course, not necessarily for publication.

THE INDIAN MEDICAL WARRANT. (OBSERVER).—We gave no credence to the report of the Indian Medical Warrant having been withdrawn, and therefore did not allude to it in the JOURNAL. Our correspondent has perhaps learnt that the same journal which spread the report has also authoritatively, in a later number, stated that the report was incorrect.

VENESECTION.—SIR: I cannot forbear offering Dr. Markham my need of sincere approbation for his lines on the subject of venesection. I am so far advanced in years as to see the immense changes in medical practice and surgery. The boldness of the latter is almost exceeding all belief in comparison with its former status. I congratulate Dr. Markham on hitting the more common sense view of treating disease, by a modification of the two extremes into which medical men have verged. Having been an old lecturer on midwifery, etc., I have constantly endeavoured to impress on the pupils that, whatever theories with their apparent degrees of success, they must maintain their opinions based on "common sense," and not be led away by the *ipse dixit* of any man who has not experience to guide him.
Liverpool. I am, etc., E. B.

THE WOODHALL AND ASHBY SPAS.—SIR: Can you furnish me with some account of the medicinal properties of the spas at Woodhall and Ashby-de-la-Zouch; or allow me to ask the same of some local M.D.; as well as the complaints in which they are said to be specially serviceable.
I am, etc.,

THOMAS DIXON JACKSON, M.R.C.S., etc.
Slaidburn, Clitheroe, February 14th, 1865.

ADVERTISEMENTS.

Weiss's Illustrated Catalogue, containing nearly 800 engravings of Surgeons' Instruments and Apparatus, classified for their various purposes. Price, 5s. 62, Strand, London.

"This catalogue has many and great merits. It is modest, truthful, carefully arranged, and extremely well illustrated. In the great majority of cases the name of the surgeon is appended to the modification which he has introduced, and frequently other makers' names are honourably attached to instruments which they first originated. These are large principles of honour which we are glad to see strictly observed in this catalogue."—*Lancet*, September 12th, 1863.

Surgical Instruments.—Arnold & Sons continue to supply Instruments of the best workmanship at moderate prices, manufactured on the premises under their own superintendence.

ARNOLD & SONS, 35 and 36 West Smithfield, E.C.

Lectures ON ORTHOPÆDIC SURGERY.

BY
BERNARD E. BRODHURST, F.R.C.S.,

OF ST. GEORGE'S HOSPITAL, AND THE ROYAL
ORTHOPÆDIC HOSPITAL, ETC.

LECTURE XVI.

ON CONGENITAL DISLOCATIONS.

THE dislocations which are for the most part found at birth, are those of the hip. Other dislocations exist however, though rarely; such as. of the shoulder, the elbow, the wrist, the knee, and the jaw; but these are almost always associated with monstrosity, or with paralysis and idiocy, or they are subluxations and not true luxations. Congenital dislocations of the shoulder, for instance, are partial displacements of the head of the humerus, simulating more or less true dislocations, with complete or partial paralysis of the muscles around the articulation; while those of the elbow and the wrist are always associated with malformation or monstrosity, and are produced by muscular retraction. Congenital dislocations of the knee are subluxations, which are to be treated by extension of the limb after subcutaneous section of the hamstring tendons. Thus, other forms of congenital dislocation occurring together with anomalies of organisation, or with paralysis, or being subluxations only, we may proceed, without further remark, to consider dislocations of the hip.

Congenital dislocations of the head of the femur occur in three directions; namely, upwards and outwards, directly upwards, and upwards and forwards. But although these three varieties of luxation occur, one alone demands serious attention—that, namely, upwards and outwards: the two last mentioned varieties having only been seen in foetal monstrosities.

Dislocations, then, of the head of the femur upwards and outwards, on to the dorsum of the ilium, occur generally as double luxations; and they are seen much more frequently in the female than in the male sex. In his lectures, Dupuytren mentions that he had seen twenty-six cases of congenital dislocation of the hip; and that these were double luxations, except only in two or three instances, where one limb alone was affected. Of these twenty-six cases, twenty-two were females and four were males. I have had twelve cases of this dislocation under my care, of which ten were instances of double luxation, and of these nine occurred in female children. Also, one of the single luxations occurred in a female child.

The causes of this dislocation have occasioned much difference of opinion. Some have supposed the affection to be hereditary; others have imagined that inflammation of the synovial membrane may have caused effusion within the capsule and disloca-

tion; while, again, arrest of development, defect in the organisation of the germ, spasm, and external violence, have each its supporters.

It will not be necessary here to enter into arguments for and against the theories which have been now recited. It is probable that congenital luxation of the head of the femur upwards and outwards, with perfect development of the head and the cotyloid cavity, is induced by sudden or violent traction at birth; some impediment having arisen to impede the completion of the birth. When the child is healthy and well developed, and the signs of disease which might have occasioned dislocation are wanting, the cause of luxation will not be found either in the articulation itself or more remotely hidden in the medulla or elsewhere; but the dislocation may probably be traced to undue violence at birth, either instrumental or direct. In the same manner, doubtless, the shoulder may be dislocated, as I have known it to be; but it is a rare accident.

Also, it is not improbable that spasm of the muscles about the hip may tend to displace the head of the femur—spasm, whether induced by external violence or by other cause. And when we find this lesion to co-exist with other spasmodic affections, such as varus for instance (and two such cases have come under my own notice), we cannot refuse to entertain the idea, that spasm may cause the head of the femur to pass from the acetabulum and lie upon its brim. The position of the foetus *in utero* is such that the head of the femur must press on the posterior and inferior portions of the capsules of the joints, the thighs being flexed upon the abdomen. A slight spasmodic action would probably be sufficient to displace the head of the bone and cause it to lie upon the brim of the acetabulum. But the head of the femur having passed the border of the cotyloid cavity, nothing more is required to displace the bone upon the dorsum ilii, than extension of the limb at birth. And, thus, the act of extension would complete the luxation by drawing the head of the femur into its ultimate position, the external iliac fossa.

The symptoms of this dislocation differ as the age at which the lesion is observed differs. At birth, it passes unobserved; there is then but little to attract attention to the displacement. When, however, luxation is suspected, and an examination is made with a view to its discovery, it is found that the motion at the hip is unusually free: that voluntary motion is diminished; and, especially, that the head of the bone occupies the external iliac fossa. The head of the bone, which is very slightly prominent while the child is lying down, may be distinctly felt on rotating the limb: and as the child grows and is able to stand, the heads of the femurs become prominent, and present visibly on the dorsum of the ilium above and behind the cotyloid cavity. When the dislocation is double, the pelvis is rendered very oblique—the pubes being carried backwards, and the sacrum in a corresponding degree being raised: so that the abdomen is rendered prominent and the lumbar region is curved forward in an abnormal degree—lordosis. The trochanters project unnaturally, and approach the crests of the ilia; and the heads of the femurs can be seen projecting on the ilia beneath the glutei. The muscles of the lower extremities, from insufficient use, are small and weak; and frequently there is produced genu valgum and

flat-foot. These several points are well shown in the accompanying engraving. (Fig. 51.)

Fig. 51.

The gait is very peculiar; and having once been seen, it can never again be mistaken: it is a rolling motion of the trunk, together with double lameness, and yet the movement is rapid and painless. There is much more deformity and lameness produced when the femur is dislocated on one side only: the toes only are then brought to the ground in walking, and the weight of the body is borne on them, the heel being raised; but the pelvis is less oblique than when both limbs are dislocated.

Morbid Anatomy. It has been already stated that one form only of congenital luxation of the hip occurs, except in cases of fetal monstrosity; namely, dislocation upwards and outwards. At birth, or soon after, the head of the femur, as well as the acetabulum, retain their normal forms; but changes rapidly take place, which result in the head of the bone being somewhat flattened in form, and the acetabulum being in part occupied with cellulo-osseous matter. At length, the head of the bone is deprived of its articular cartilage, and becomes atrophied and misshapen; and it may eventually escape through its capsule, and lie in close contact with the ilium. Then a false articulation is formed: first, the capsule commences to be formed; and afterwards, bone is thrown out around it and upon the ilium, which is

fashioned more or less into a cavity to receive the head of the femur.

The *treatment* of this affection is, in its early stage, much more hopeful than is generally supposed. If dislocation occur without other abnormality, the acetabulum and the head of the femur are usually perfect at birth. There should, then, be neither difficulty in reducing the dislocation, nor in retaining the head of the bone when reduced. The diagnosis would present the only difficulty. When, however, attention has been directed to the occurrence, a careful examination would speedily cause the various points now mentioned to be detected; and the dislocation being recognised, its reduction would be easily effected. Perhaps, if one point more than another were to be insisted on in the reduction, it would be that the replacement should be effected as gently as possible.

When the dislocation has been overlooked at birth, and attention is only directed to it after several years, changes will have occurred which may prevent the head of the bone being retained in the acetabulum. Partial absorption will have taken place, both of the head and of the cartilaginous margin of the acetabulum; and the cavity itself will probably be in part filled with new matter. It is in consequence of the changes which are here described that it has been supposed by some that the acetabulum has not been formed in the embryo.

When the luxation is single, the diagnosis is easy, and the lesion ought always to be discovered immediately after birth. Should it unfortunately be overlooked, and not discovered until the child exhibits lameness in walking, it may be necessary to use prolonged traction by means of weights and pulleys on the inclined plane. There is no difficulty, even after several years, in restoring the length of the limb, by drawing down the head of the femur to rest on a level with the acetabulum; but there is great difficulty in retaining it in that position. By retaining the bone for a long time in this position, and making pressure upon it, it may be hoped that eventually it may be permanently retained. Great patience and endurance, however, are required, and such nice adjustment as is not easily to be obtained; but since the luxation has been in some instances overcome, it is probable that the head of the bone may be reduced and retained in most of the cases, if not in every case, of congenital luxation, when it has occurred without other abnormality, and when no long time has elapsed before the attempt at reduction is made.*

* I am indebted to the publishers of Holmes's *System of Surgery* for permission to use the above engraving, as well as for much of the matter in the lecture. For more information with regard to these lesions, however, I must refer to vol. iv of the work itself.

QUACKERY IN PHILADELPHIA. Quacks are full of expedients. One of the latest is that adopted by one of the genus in this city, who prefixes "Rev." to his name and affixes "M.D." He rented one of the theatres and advertised sermons to be preached on "taking subjects" on Sabbath evenings, admittance five cents "to pay expenses—no change given!" In these sermons he spoke of a "physiological religion," and frequently wandered away into the fields of medical theory and practice, referring the curious hearer to "his office" for further information! It is needless to say that in this way he picked up many a patient and pocketed many a fee. (*Phil. Med. Press.*)

HOSPITAL PRACTICE:

METROPOLITAN AND PROVINCIAL.

BIRMINGHAM GENERAL HOSPITAL.

ENCEPHALOMA OF THE CEREBRUM.

Under the care of JAMES RUSSELL, M.D.

THE following case presents some points of considerable interest. We may remark how strikingly the cancerous nature of the tumour, characterised as such tumours are by quick increase, answered to the very rapid progress manifested by the principal symptoms, and especially by the blindness. Although the history does not afford us means of judging when the earliest symptoms made their appearance, there can be no question that the pain had only been severe for ten weeks, and that the patient lost his sight almost entirely in the course of two weeks. It may also be noted, that the symptoms attained their full severity at once, probably from the tumour having reached the organs situated at the base of the brain before it induced any great disturbance.

The symptoms were typical of a tumour within the skull, and there was much to lead us to refer its situation to the cerebellum. The pain affected the occipital region; and, although it extended also to the forehead and temples, such a position of the pain is also met with in cerebellar disease. In a case of my own (*Medical Times and Gazette*, vol. i, 1863, p. 534), of tumour in the middle lobe of the cerebellum, the pain was seated in the temples. Again, loss of vision is known to be of no infrequent occurrence in connexion with tumours in the cerebellum. Vertigo was also mentioned by the patient, and probably loss of the faculty of balancing the body.

The pain was paroxysmal; it was also distinguished by its great intensity. Severity is sometimes a striking quality of the pain attending tumour of the brain; the pain not infrequently amounts to agony. In the present instance, the size and density of the tumour would give it the power of producing pain by pressure alone; and the remarkable posture instinctively assumed by the patient seemed to intimate that he derived relief from throwing the weight of the tumour off the nerves at the base of the brain. In other cases, however, as in my own case quoted above, the smaller size and less dense nature of the tumour negative the supposition that its weight can have much share in producing the pain, which, therefore, must be referred to stretching of the cerebral fibres, rendered preternaturally sensitive by protracted irritation.

The blindness also deserves attention. As is well known, this is a symptom not infrequent in cases of tumour of the brain, especially when seated in the cerebellum. In the present case, its cause is very satisfactorily furnished; and I would especially note the peculiar disposition of the parts at the base of the brain, which rendered a tumour in one hemisphere, not transgressing the middle line, capable of producing blindness in both eyes. This symmetrical affection of the eyes was one of the chief circumstances which led me to refer the disease to the cerebellum.

I may refer to a very similar case under the care of Dr. Wilks (*Medical Times and Gazette*, vol. i, 1863, p. 535), in which a tumour of the posterior lobe of one hemisphere of the brain caused blindness by pressing

upon "the parts about the origin of the optic tracts". In this case, however, the tumour projected beyond the middle line, and the pressure was direct on both sides.

In many instances, however, we do not obtain the mechanical explanation of the blindness afforded by the present case, the optic tract and quadrigeminal bodies being found quite out of reach of the tumour; not to mention other cases in which blindness occurs in connexion with disease seated exclusively in the spinal cord. In such cases, other explanations, connected with the state of the blood-vessels of the optic organs, or with some more obscure cause affecting the nutrition of these organs through nervous influence, have been advanced.

I would also remark on the incomplete and varying ptosis, clearly due to slight and varying pressure exerted by the tumour on some of the closely adjoining fibres of the third nerve; and on the constant torpor, the dulness of apprehension, and slowness of recollection, evinced by the patient, resulting from the general pressure from which the entire cerebral mass must have suffered.

Fungoid Tumour of the Brain: Blindness: Compression and Atrophy of the Optic Tracts.

SECTIO CADAVERIS, thirty hours after death. *Head.* The veins of the dura mater and the longitudinal sinus were very full of dark blood; the cerebral substance also was much loaded with blood. The vessels at the base of the brain, and the entire substance of that organ and of the pons and medulla oblongata, were quite healthy.

A large firm tumour occupied the lower part of the middle lobe of the right hemisphere of the brain; it was very irregular in shape, nodulated, about three inches each way. It rested upon the middle fossa of the skull, where it was covered by a thin layer of cerebral tissue; it was also connected closely with the substance of the brain posteriorly; but in other parts its surface had little connexion with the surrounding tissue; at least, it was perfectly clean after the tumour had been removed. It projected into the right lateral ventricle; had pushed forward the hippocampus major, which curled over its surface; and had so greatly compressed the optic thalamus, and expanded it, that the ordinary shape of that body was quite obliterated. The corpus striatum was intact. At the base, the tumour, by its pressure, had given a twist to the central organs, depressing the corresponding crus, and throwing up that of the opposite side. The same twist was observed on the upper surface of the mesocephale, in the oblique position of the corpora quadrigemina. The tumour projected close upon the place where the right third nerve emerges; the trunk of the nerve was, however, entire. The optic nerves were healthy; but the right optic tract was compressed and completely flattened between the tumour and the crus, whilst the left crus was so much forced upwards as to cause a like pressure of the left tract between it and the middle lobe of the brain. In consequence of this distortion, the left tract was nearly as much flattened as the right. By a very careless accident, I destroyed the right optic tract; but the left tract, examined under the microscope, presented hardly any indication of its normal tissue; some short fragments floating around were nearly all that remained of its tubules. The anterior pyramids and the spinal cord, examined microscopically, were quite healthy.

All the other organs of the body were healthy, but were much loaded with blood. No secondary formation of cancer was discovered.

The tumour presented the usual appearance of encephaloma of a firm character; it exuded only a clear

fluid. It appeared composed mainly of caudate nuclei, with fine fibrous tissue. The nuclei varied in diameter from 1-750th of an inch downward, and each presented a long caudate appendage.

History. W. G., aged 28; married; labourer. We were, unfortunately, compelled to rely entirely on the patient for information; and his torpid condition rendered his history more scanty than could be desired. Eighteen months ago, he was stunned by a heavy blow on the back of the head. He kept his bed for a month afterwards, and it was three months before the wound healed. A small cicatrix over the apex of the occipital bone was, however, the sole remains of the injury, the bone being quite uninjured.

His present illness was only of ten weeks' duration. It began with severe frontal pain, which at once disabled him from work, and more than once kept him in bed for a day or two. A fortnight ago, his sight began to fail. It went a little at first, and only at times; but the blindness rapidly increased, and now is almost complete. He thought that his hearing had been impaired for a month. He had never had any sickness.

I did not see the patient for the first fortnight of his residence in hospital; but it is noted that, when admitted, he complained of severe pain in the frontal, temporal, and occipital regions. In the back of the head, the pain was more severe than it had ever been before; he had also much vertigo. He was very torpid.

The pain increased in severity, especially in the right temple; and when in greatest suffering, the patient placed himself on his hands and knees, with his head hanging low. The head was quite free from heat. The mental faculties became more dull. The pulse was 64.

On the twelfth day after admission, I found him heavy and sleepy, inclined to talk foolishly; but, when thoroughly roused, sufficiently intelligent. Nevertheless, apprehension was obviously slow. He spent his days mainly in sleeping, partly from the effects of opium required to ease the pain, and partly from extreme torpor. The pulse was 64, feeble; respirations 20. He was nearly blind, only just distinguishing the presence of any body between him and the light. The pupils were much and equally dilated. Hearing was perfect.

There was partial ptosis of the right eyelid, but subject to singular variation, diminishing to a very considerable extent when the patient was fully roused. With this exception, the function of all the cerebral nerves, and even of the right third pair, was perfectly normal, excepting that there was some convergence of the axes of the eye, probably consequent upon the loss of the guiding power of vision.

No evidence of paralysis in the limbs could be obtained, excepting only that the movements of the right lower extremity seemed rather formal; but he appeared unable to balance himself, and could not advance without some one at hand to steady him. I should, however, say that the patient's dulness, his obvious weakness, joined with the confusion consequent upon recent loss of vision, rendered the evidence on this point not perfectly conclusive.

A day or two afterwards, when more awake, he gave us with accuracy some details of his history; but the long pauses testified difficulty in arousing his memory.

He was admitted December 17th, and died on the 28th of the following January. He did not present any important change in the symptoms. Sometimes the pain was absent for some days; then it would return with severity, the patient assuming the peculiar posture noticed before, and moaning very much. The ptosis also retained its marked variability. His pulse

remained about 68. Towards the last he wandered somewhat, and then became so dull that it was impossible to rouse him; and finally he passed his evacuations involuntarily. Some dysphagia also presented itself at this period of his case.

His torpid condition quite precluded examination by the ophthalmoscope, though two attempts were made by my friend Mr. Bartleet.

LIVERPOOL NORTHERN HOSPITAL.

CASES OF ACUTE DISEASE OF THE CHEST.

Under the care of A. T. H. WATERS, M.D.,
Physician to the Hospital.

[Continued from page 606 of vol. i for 1864.]

CASE XXVIII. *Pneumonia: Recovery.* (Reported by F. T. ROBERTS, M.B., Junior House-Surgeon.) W. S., a labourer, 30 years of age, was admitted into the hospital on March 23rd, 1864. He said he had been much exposed to cold, and that, three days before admission, he was seized with pain in the right side. He did not, however, give up work till the following day—viz., March 21st. On admission, he complained of severe pain in the right side, cough, and dyspnoea. The pulse was 120; the respirations were 40 per minute. The skin was hot and dry, and the tongue furred. There was deficient movement of the right side of the chest, with crepitation all over the back of the right lung. He was ordered a quarter of a grain of antimony every four hours, a blister to the right side, and beef-tea.

On the 24th, the pulse was 116; the respirations were 32.

On the 25th, the pulse had fallen to 108; the respirations were 40. The pain in the side continued. He had expectorated some rust-coloured sputa. He was ordered a grain and a half of opium at bedtime, and five grains of carbonate of ammonia every four hours. Three ounces of port wine were given at night.

On the 26th, the pulse was 88; the respirations were 26. He had slept, the pain was less, and he was generally improved. There was dulness with crepitation over the front and side of the right lung; but there was no dulness at the base behind, and the breathing behind was good. The opium was repeated at bedtime; he was ordered four ounces of wine; and some ipecacuanha was added to the ammonia mixture.

On the 27th, the pulse was 68. He had slept well, and was decidedly better. The opium was repeated.

On the 29th, the pulse was 70. He complained of a good deal of pain in the chest, which was relieved by the application of croton-oil liniment.

He rapidly improved from this date. He continued the ipecacuanha mixture, and had six ounces of wine daily.

On April 1st, the breath-sounds were normal all over the right lung. He was discharged well.

CASE XXIX. *Pneumonia: Recovery.* (Reported by F. T. ROBERTS, M.B., Junior House-Surgeon.) Patrick F., a carter, 36 years of age, of spare body and somewhat intemperate habits was admitted into the hospital on August 8th, 1864. On the morning of admission, at an early hour, he was out in a shower of rain, got very wet, and did not change his clothes afterwards. In the course of two or three hours, he felt pains in his limbs, and had severe rigors. Soon after he was seized with severe pain in the left side.

When admitted into the hospital, about midday, he complained of a severe pain in the lower part of the left side, increased on inspiration. There were no febrile symptoms, and no abnormal physical signs about the chest. He was ordered a dose of chlorodyne,

and turpentine fomentations. In the evening, he was feverish; but the pain was somewhat less.

On the following morning, his condition was as follows: Pulse 120; respirations 32; skin very hot and dry. The tongue was coated with white fur. The pain in the side had increased, and there was tenderness on pressure. There was no cough; but a good deal of dyspnoea. There was good movement on both sides of the chest. *At the lower and back part of the left lung, the respiratory murmur was peculiarly loud and harsh; but there was no crepitation.* He was ordered a grain of opium three times a day, with a tenth of a grain of antimony every four hours; and for food, beef-tea and milk.

On the 10th, the pain had almost gone. The pulse was 104; the respirations were 28. The medicine had produced vomiting and purging. The physical signs were as follow: There was deficient movement of the left side, and dulness at the left base. There was crepitation over the lower half of the left lung. The mixture and pills were stopped, and the following was prescribed.

R Vin. ipecac. ʒij; tinct. opii ʒj; mistura camph. ʒvj. Cap. ʒj 4ta quaque hora.

On the 11th, the pulse was 106; the respirations were 26. The pain had returned in the night, and was again severe. He had expectorated a small quantity of tenacious mucus. There was less crepitation. The respiration was distinctly tubular at the base of the left lung, with strong bronchophony. A blister was ordered; and two drachms of antimonial wine were added to the mixture.

On the 12th, the pulse was 100; the respirations were 24.

On the 13th, the pulse was 96. There was slight dulness at the back of the left lung, with abundant moist crepitation. Six ounces of port wine daily, and a carbonate of ammonia mixture were ordered.

On the 15th, there was no dulness at the back of the left lung; but crepitation was audible.

On the 16th, the patient was quite convalescent, and able to take meat diet.

On the 17th, he was ordered quinine. He did not recover his strength very rapidly; but steadily improved under the influence of good diet and quinine and iron.

He was discharged well on September 7th.

[To be continued.]

THE HOLBORN UNION. Last week, at the meeting of the guardians of the Holborn united parishes, the letter of the Poor-Law Board, on the late inquiry on the death of Timothy Daly, came on for consideration. A desultory conversation arose on this letter, and on the recommendation of Dr. Carr, the medical officer who assisted Mr. Farnall; namely, that the drugs should be found by the parish, and that the medical officer's salary should be raised from a £100 a year to £150. It was stated this would be a double "rise," as the medical officer now has to find the drugs out of his salary of £100, and two or three of the guardians were of opinion that the salary of £100 was sufficient, as the surgeon had fees which amounted to upwards of £50 a year additional. After a long discussion, it was resolved to recommend the Board to reconsider the whole subject of the medical relief, both indoor and out. On the motion of Mr. Cullen, it was carried that the clerk should write to Mr. Norton and convey to him the censure of the Poor-Law Board, with the expression of a hope that in future he would attend to his duty in respect to keeping the books.

Original Communications.

ON THE PHYSICS OF DISEASE, AND THE PHYSICAL PATHOLOGY OF THE BLOOD.

By BENJAMIN W. RICHARDSON, M.A., M.D., Senior
Physician to the Royal Infirmary for Diseases
of the Chest.

Note on the Paper of Mr. Rhodes on Vital Force.

MR. RHODES, in the excellent paper which he published in the JOURNAL of February 4th, has done me the honour to refer to my views on "vital action." In making his remarks, Mr. Rhodes has evidently misunderstood my meaning on two points, and I would, therefore, offer a brief explanation.

1. In speaking of heat as the means of motion in the organism, I do not use the word as specific, but as indicating simply a form of motion; and I am quite ready to agree that the force that is absorbed or laid by in the nervous system is simple motion. At the same time, I feel that the motion produced or evolved in the body is due to the oxidation of carbon, and is primarily manifested or made tangible in the form of heat, or, more correctly speaking, caloric. In other words, the oxidation of carbon is sufficient to produce all the phenomena of animal motion.

2. I agree that the motion conveyed to the nervous system by the blood is communicated not to the nervous centres alone, but to the nervous periphery and to every part of the nervous system which the blood enters; and I would do away altogether with the term "current of nerve-force" as it is usually applied. In my Lettsomian lectures, delivered four years ago, I very carefully considered this point, and was, I believe, the first to point out the communication of motion to nerve at the periphery and in every part. Mr. Rhodes will find a full account of this view in the *Transactions of the Medical Society of London*; but I quote a passage or two in full.

"According to the view I hold, I should infer from all the phenomena observed, that the nervous system is in every part a producer of the peculiar force with which it is endowed; not that the brain or ganglia are special producers; not that a current from these centres, intermittent or continuous, is traversing the nerve-fibre; but that the nerve-structure, so long as it is supplied with blood, is producing the force wherever there is nervous filament. I look on the vast area of nerve-fibre in the peripheral surface; and I see in it a mass equal to that of the brain; I see this mass supplied with blood everywhere, and built always on the same plan. I assign to it everywhere the same purpose and labour.

"In this sense we may look on the muscular system as an entire independency, and on the nervous system also as an entire independency. The muscular system, nourished by blood and charged with caloric as caloric; the nervous system, nourished everywhere by blood, and charged also with caloric in its electrical modification; each are independent systems. We conjoin the systems, and the result of their equilibrium is a simple passive state, while the

result of a disturbance of their equilibrium is motion and sensation.

"Thus, as every portion of nerve down to the minutest branch possesses producing power, the mass of the force generated is so universally distributed, that interference in any part of the nervous communications is reflected to the whole nervous system. So when our distinguished brother, Dr. Brown-Séquard, produces artificial epilepsy, and induces the paroxysm by irritation of some particular external point of nerve, he does, in fact, in that irritation touch at one presenting point the universal fluid pervading the whole body of his subject, and excites, not by special transmission, but by general disturbance of the equilibrium of the forces, a convulsion through the whole muscular organism. So, when with the intermittent current I galvanise a portion of the nervous tract, I produce convulsion, because I induce an alternation of force; at one moment allowing the natural equilibrium to establish itself; at the next moment disturbing it. So, when I continue the current without intermission, I virtually cut off altogether the included nervous tract from its system and cause paralysis of will, because I have cut off also communication with the brain; but I can nevertheless call into play at pleasure the excitability of the nerve-trunks below, as long as they continue to summon into their service blood for their nourishment and force-producing faculty.

"If it were possible to entirely remove from the body every muscular fibre, and, leaving the nervous system entire, still to supply that system with blood and surround it with those conditions under which its blood could be applied; that nervous system would exist as a motionless intelligence. It might think, feel, and by virtue of its sensual organs appreciate and know the external world surrounding it; yet be incapable alike of act or of expression. On the other hand, if every particle of nerve-matter could be removed, the muscular system being left with its attachments to bone still secure, and its blood-current free; that muscular system would remain an unintelligent mechanism, having in itself its *vis insita*, but feeling incapable of exerting movement until brought into action and guided by the intelligent part of a more perfect animal.

"By the combination of the two systems in the perfect organism we obtain, so long as the necessary conditions for life are supplied, the doubly endowed and self-acting body. An excitation of light refracted on the nervous expanse of the retina touches the pervading force, and the animal sees; but this light must be presented to the nerve-expanse, or, in other words, to the force that pervades the expanse, in such way that the absolute physical picture shall be put upon it, or the picture will not be seen. It is not that the picture is to be carried to the brain, but that it is to be looked on at this point of the nervous expanse by the presiding force. A vibration is set up in a mere physical membrane, spread above another distribution of nerves, and the animal hears; it is not that anything is conveyed specially to the brain, but that the equilibrium of the pervading force is disturbed. An impression is made on the skin, and the animal feels; it is not that any current is conveyed to the brain, but that the impression disturbs the balance of the nerve-fluid throughout its universality. The impression made is slight, and it is pleasant, or not painful; it is severe, and it excites the whole animal body, so that the body writhes in agony, and may even die from the reflection of the impression upon the muscular fibre, and the resultant spasm."

RETROSPECTIVE NOTES ON OUT-PATIENT PRACTICE.

By C. M. DURRANT, M.D., Physician to the East Suffolk and Ipswich Hospital.

DIGESTIVE SYSTEM. (Continued from p. 141.)

11. *Intestinal Worms.* The only varieties of intestinal worms that have presented in the last two years, are the *trichocephalus dispar* or long thread worm, the *ascaris vermicularis* or short thread worm, and the *tania solium* or common tape-worm. We have had occasional examples of the large round worm, the *ascaris lumbricoides*, but no case has occurred during the period to which these notes refer. The variety that has obtained most frequently, is the small thread-worm. These have existed in adults as well as in children.

In the treatment of ascarides, the use of injections will generally be successful; but in out-patient practice, the adoption of this measure is often attended with much inconvenience. I have generally depended upon calomel and scammony as a purgative, giving as medicine infusion of quassia with chloric ether. If this plan fail, which it has seldom done, the injection of common salt, or the infusion of quassia, with the tincture of the sesquichloride of iron, should be tried.

In the *tania* cases, I have been well satisfied with the employment of the oil of male-fern. I have usually ordered a full dose of castor-oil to be taken the morning previous to administering the specific remedy. The patient should be directed to limit the quantity of food taken during that day; and on the following morning one drachm or a drachm and a half of the fern oil is to be taken, suspended in mucilage, and on an empty stomach. This plan, repeated twice a week if necessary, for three or four doses, has effected the expulsion of the worm; which, either whole or in portions, is generally brought in triumph by the patient on the next visiting day.

Ether in large doses has lately been recommended by M. Lortet as a remedy for *tania*. His mode of giving it, and the dose, will be found in our JOURNAL for January 21st. With a view to prevent the recurrence of the worm, the patient should be directed to abstain from eating pork, or, if he take any, it should be of the best quality and thoroughly cooked. The raw hams, eaten so largely in Germany, are a fruitful source of *tania*. The tincture of sesquichloride of iron with quassia may be taken for a time with advantage, and if the slightest suspicion of the re-formation of the parasite exist, the oil of male-fern, preceded by castor-oil as before, should be at once administered. It may be sometimes noticed that tape-worm becomes, as it were, epidemic within a certain locality, and then disappears, not to be seen again perhaps for a lengthened period. This fact may be explained by the researches of Küchenmeister and Von Siebold, who have shewn that the *cysticercus cellulosæ* of the pig and sheep is the same parasite, in a different stage of development, as the *tania solium*. Hence, if the former have existed largely in the flesh of those animals in any particular spot, it is easy to understand the comparative frequency of tape-worm at one time, and its almost entire absence at another.

12. *Dysentery.* Only three well marked cases of dysentery have applied as out-patients in the past two years. In one of these, the disease was traceable to a residence in the West Indies. In a second, it first shewed itself during a sojourn in Canada. In the third, the exciting cause was, I believed, attributable to exposure to cold and moisture acting upon a

mucous membrane irritated by an accumulation of unhealthy secretions in the colon.

The first case occurred in a young sailor, and had advanced to a chronic stage. He was emaciated and anxious, and complained of griping pain in the abdomen, which was very tender on pressure, particularly over the ileo-cæcal valve. The evacuations were very frequent, and mixed with blood and mucus. He was directed to have the abdomen poulticed with linseed meal, and as there was much fermentative action in the bowels, I ordered him to take two minims of creasote with one grain of opium three times a day. This medicine acted very satisfactorily, and he recovered perfectly, requiring only cod-liver oil as a tonic.

The second case was taken into the hospital, and treated at first with opium and creasote, which, in this instance, did not check the discharges from the bowels. He was then ordered three grains of ipecacuanha, to be increased by a grain daily up to ten grains, three times a day. This medicine did not produce nausea, but it entirely cured the disease. Flatulent distension of the abdomen continued to give the patient some discomfort. This, however, was quite removed by the compound galbanum pill at night, with the tincture of sesquichloride of iron with chloric ether during the day.

The third case was also admitted as an in-patient, the treatment out of door having been ineffectual. This man had had from eight to sixteen evacuations daily, consisting of bloody mucus, with horribly foetid and unhealthy liquid faecal matter, and the abdomen felt doughy and resisting. The treatment was commenced by two or three doses of castor-oil guarded by laudanum. This had the effect of emptying the intestines of a considerable quantity of semi-solid faecal accumulation; and the inflammation, with its attendant purging, was subsequently quite cured by ipecacuanha in ten-grain doses.

Another rather severe case is now leaving the hospital, in which the same remedy, with poultices, has produced an equally favourable result; but, in consequence of sickness, this patient was unable to increase the dose beyond five grains.

On speaking upon the subject of dysentery as it occurs in India to a friend, an Inspector-General of Hospitals, who has spent the greater part of his life in that country, he states that no remedy is found to act so favourably upon the disease as ipecacuanha. He tells me that he has sometimes found it necessary to give as much as two drachms three times a day, and this with success, after the failure of opium in doses of four grains every four hours. This gentleman also stated that the sickness induced by ipecacuanha was best obviated by giving it combined with the extract of gentian.

13. *Colica Pictonum*. But one case of this affection has presented as an out-patient in the two years, and that by no means of a severe character. The blue line along the edge of the gums was well-marked, but there was no paralysis, and the symptoms were limited to colic with constipation. The disease yielded without difficulty to purgatives, followed by iodide of potassium. The malady in all its bearings has been so fully treated of in our JOURNAL of January 14th, by Dr. Fleming of Birmingham, that it will be unnecessary to enter further upon the subject in these notes.

URINARY SYSTEM.

1. *Albuminuria*. Until recently, the majority of cases of diseased kidney characterised by an albuminous condition of the urine, were included under the general term of granular degeneration or Bright's disease. Dr. George Johnson has done good service

by classifying the different forms of this affection according to the pathological changes upon which each variety depends.

The cases which have presented among our out-patients have been confined to the varieties designated by Dr. Johnson as acute and chronic desquamative nephritis. The two cases of acute renal dropsy both occurred in children, and could be traced to exposure to cold after an attack of scarlet-fever. This is a very common affection among the children of the poor, from the well known fact of acute dropsy supervening so much more frequently upon a mild than after a severe attack of scarlet-fever, rendering careless nursing and rash exposure such ripe causes of the disease. The vessels of the kidney becoming laden with the scarlet-fever poison, in consequence of the suppressed action of the skin, the organ is unable to perform its functions, and while the epithelium is being thrown off in large quantity, there is an escape of serum, and sometimes of blood-globules, into the uriniferous tubes, which, mixing with the urine, renders it albuminous.

Acute desquamative nephritis is not a disease that can be safely treated as an out-patient's malady, but in the cases of the two children, here referred to, the symptoms were not urgent, and by directing them to be kept in bed, and giving purgatives and diaphoretics, and subsequently iron, they both recovered, and the urine was restored to a healthy condition. The patient should in all cases be directed to wear flannel next the skin after an attack, however mild, of acute desquamative nephritis. The remaining cases which came under notice as out-patients, presented merely the phenomena of chronic renal dropsy uncomplicated by heart-disease. They were much benefited by treatment, but the condition of the kidney precluded its restoration to a healthy structure. A few words upon the chemical as well as the microscopical examination of the urine, and the import of the latter in reference to diagnosis, may not be out of place.

In examining the urine for albumen, I believe that a correct estimate of its amount and value as a diagnostic sign is often overlooked, from the hurried and imperfect manner in which its presence is sought. In testing for albumen, it is not sufficient to depend upon the result obtainable either by heat or nitric acid used separately. If, for instance, the urine be alkaline, heat will often fail to throw down albumen, even if it exist in large quantity. It is necessary, therefore, to make the urine first *decidedly* acid, and then apply heat, which will freely develop the precipitate. Again, heat used alone, without the addition of acid, may render the urine cloudy from an excess of earthy phosphates. On the other hand, nitric acid, if added singly, may deceive, by decomposing the acid salts of the urine, and thus form a deposit, which will be again dissolved by the application of heat.

It is unnecessary to boil the urine in order to obtain a precipitate, as a temperature of 180°, or even less, will suffice to coagulate the albumen.

Chronic desquamative nephritis, which is essentially a disease of mal-nutrition, may obtain as a sequel to the acute form, or it may originate as a blood-disease; and it may exist for some time without the occurrence of dropsy; or, if any be present, it is only evidenced by slight morning puffiness of the eyelids, or evening swelling of the ankles. Under these circumstances, we may have as symptoms only general *malaise*, with dyspepsia, and chronic rheumatic or myalgic pain. The patient often finds it necessary to empty his bladder more frequently than usual, especially at night; and the quantity of urine is sometimes considerably increased. On examining a deposit collected from the urine, we find it to con-

sist of granular masses of fibrine, with cylinders, and broken up epithelium which has been thrown off, and subsequently washed from the tubes by the urine.

In the acute disease, the epithelium is generally entire; while, in the chronic form, the cells are disintegrated and granular, and free from the blood-corpuscles which frequently obtain in the former variety.

There is another form, described by Dr. Johnson as the non-desquamative and fatty degeneration of the kidney. This may result from ulterior changes taking place in the desquamative varieties; or it may originate from exposure to any of the causes productive of depraved nutrition. In the fatty degeneration, the urine is more frequently diminished in quantity, highly albuminous, clear, and of very low specific gravity; and the resulting anasarca is a much more common and early attendant than in the desquamative form of the disease.

The microscope shows waxy casts, containing oil-globules, some adhering to the walls of the cast-off cells, and others scattered over the field of the instrument.

In reference to prognosis, Dr. Johnson states that "the quantity of disintegrated epithelium in the urine is a pretty accurate measure of the rate at which the disease is progressing." Again: "A very advanced state of disease is indicated by pale, almost colourless urine, rather small in quantity, more or less albuminous, with a scanty sediment containing large waxy casts."

In the treatment of chronic albuminuria, the facilities for benefiting the patient will be, of course, much enhanced if we can procure his admission within a hospital; and, indeed, if dropsy, or other secondary complications, be severe, treatment as an out-patient will be impracticable.

If much tenderness on pressure exist over the kidneys, the withdrawal of a few ounces of blood by cupping may sometimes be resorted to with advantage. Afterwards, repeated dry cupping, and the application of mustard plasters or a strong solution of iodine over the same spot, will be useful. The warm or hot air baths, when attainable, will be important adjuncts to the treatment.

For the removal of the anasarca, purgatives and diaphoretics will be found very valuable remedies. If the effusion be not very extensive, I have seen an excellent effect from one-eighth of a grain of calomel taken every night, followed by a drachm of the bitartrate of potash in three or four ounces of water the next morning. If the dropsy be extensive and distressing, the calomel may be increased to one-third of a grain and upwards, taken early in the morning, so as to insure copious watery evacuations. There is no better diaphoretic in this disease than the citrate or acetate of ammonia, with which I usually combine the spirit of nitrous ether and tincture of digitalis.

I have not myself seen reasons to fear the use of diuretics in the treatment of chronic albuminuria, especially if combined with an alkali, which renders the urine less acid and irritating to the denuded tissues over which it has to pass. The following is a formula which sometimes answers exceedingly well.

(*Phor. Lond.*) R. Ferri ammon.-citrat. ʒss ad ʒi; potasse bicarb. ʒiiss; potasse nitrat. ʒss; tinct. digitalis ʒi; spir. æther. nit. ʒij; mist. camph. ad ʒviij. M. A sixth part three times a day.

Having more or less drained off the serum, no remedy becomes so valuable as iron: and no preparation answers better than the tincture of the sesquichloride, with sulphate of magnesia and tincture of digitalis.

The cases of our out-patients did not present com-

plications requiring especial treatment for any secondary disorder besides the anasarca.

The removal of the poor to a more open and healthy residence is seldom attainable; but, if it can be effected, it is a measure tending to improve the deteriorated condition of the blood which accompanies this disease.

For the higher and wealthier classes, some well authenticated cases have been detailed, in which the most happy results have followed a long sea-voyage to a tropical climate. In the case of young persons suffering from the chronic desquamative form of the disease, the propriety of recommending such a step might become a matter for grave consideration and consultation.

[To be continued.]

REMARKS ON PHTHISICAL INSANITY.

By S. W. D. WILLIAMS, M.D., L.R.C.P. Lond., Acting Medical Superintendent of the Northampton General Lunatic Asylum.

THE learned Lecturer on Psychology in University College (Dr. Sankey), in his "Illustrations of the Different Forms of Insanity", in the *JOURNAL* for February 11th, seems to doubt whether there are symptoms of a peculiar and distinct type in "phthisical insanity", by which it can be detected from other forms of insanity. I hope he will not think me presumptuous if I take the liberty of differing from one who has had such extended experience as he has; but, both before and since the appearance of Dr. Clouston's paper in the *Journal of Mental Science*, I have paid special attention to such cases, and I cannot but agree with Dr. Clouston in his theory. I will go even further, and assert that I could diagnose incipient tuberculosis from a mere examination of the psychical condition of a patient suffering from this disease, and have certainly done so on many occasions.

In such patients, I should expect to find great excitability, irritability, and emotional exaltation; a tendency to fits of laughing and crying; delusion of a suspicious nature, and a most unpleasantly strong tendency to misconstrue the actions of their attendants; constant complainings of everybody and everything. Indeed, the more assiduously such patients are attended to and cared for, the more capricious, selfish, and unthankful they become. Nothing pleases them; and the least irregularity gives rise to delusions and hallucinations which torment and distress them beyond measure. There is a strange mixture of sense and nonsense, reality and delusion, pertinence and irrationality, in all they do and say. They will utter the most satirical and witty things one moment, and on the next wander into strange paths strewn with the most wild and chaotic vagaries and ideas. At rare intervals, they become quite calm, rational, and happy; and seem to revel in sweet recollections, whilst

"Their memory brightens o'er the past,
As when the sun, concealed
Behind some cloud that near us hangs,
Shines on a distant field."

It is impossible, within the compass of a short note, to accurately do justice to this subject; but such a collection of symptoms as even those run through above never, I submit, occur except in connexion with insanity combined with tuberculosis; and yet the faithfulness of my description will, I think, be allowed by all who have had any long connexion with mental alienation.

CASES OF ORTHOPÆDIC SURGERY.

By DR. BEREND, Director of the Orthopædic and Gymnastic Establishment at Berlin.

CASE I. *Permanent Restoration of the Functions of a stiff Elbow-joint (complete Ankylosis) by Resection of the Epiphyses.* The operation was executed five years ago; and, considering the amount of osseous ankylosis, it was indispensable. The result exceeded all expectation, inasmuch as the motion of the elbow-joint, which was quite impossible before, was perfectly restored. Of physiological interest is the circumstance, that the resected epiphyses of the upper arm and ulna grew into the shape of a real elbow-joint. This regeneration was not obtained by the preservation of the periosteum.

CASE II. *Spurious Ankylosis of the Elbow-joint; Oblique Fracture of the Epiphysis of the Humerus.* The fracture had passed through the internal condyle and trochlea without any luxation. The internal condyle was split into two fragments, the undermost of which was dislocated and united to the uppermost. The joint had become useless. From the nature of the injury, an operation in this case was not admissible; but the advantage obtained by gymnastic treatment appears the more evident.

CASE III. *Spastic Right-angled Fracture and Ankylosis of the Elbow after a Fall, cured merely by Gymnastic Exercise.* This observation belongs, perhaps, to those that are most rarely met with, and may be compared to a similar case of spasmodic knee-contraction caused by injury of the leg, the highly interesting cure of which is described by the author in the tenth account of his establishment (p. 19, Berlin, 1861, Hirschwald). The above patient suffered a fall, in consequence of which the elbow was at once permanently placed at a right angle. Neither the application of cold nor plaster bandage brought relief. Gymnastic treatment, carried on for three months, perfectly restored the functions of the joint.

CASE IV. *Fracture of the Forearm, Gangrenæ, Consecutive Contraction of the Forearm and of the Wrist, with Impossibility of using them. Section of the Palmaris Longus. Treatment by Orthopædic and Gymnastic Exercise. Restoration of the Normal Shape and of the Functions of the Forearm and of the Hand.* This observation proves the correctness of Dr. Berend's opinion, that, with a certain species of distortions of the fingers, the carpal flexors are principally concerned; and that the resection of them (in the above mentioned case, the resection of the palmaris longus) is sufficient, while tenotomy of the real flexors of the fingers is to be avoided. At the same time, the usefulness of a rational and varying gymnastic and orthopædic treatment, in which so often the whole mystery of orthopædy is comprised, is placed in the proper light.

CASE V. *Paralysis of the Right Lower Extremity in an Infant; Inclination of the Pelvis; Varus Paralyticus; Cure by an Operation, by Orthopædy, and Electricity. Amelioration of the Walking Movement by Application of an Orthopædic Apparatus. Restoration of the Normal Position of the Pelvis.* The indispensableness of orthopædy as a means of support with paralytic muscles, especially of the nether extremities which are short of the quadriceps, is shown by this observation. The quadriceps is replaced by propping the knee and transferring the whole power of bearing to the muscles of the hip, as the latter suffice to effect locomotion. The realisation of this principle (which, unfortunately, is by no means universally acknowledged) is repeatedly recommended

to the physicians, and the success obtained in the case just mentioned pointed out.

CASE VI. *Ankylosis of the Thigh at both Sides, with the highest Degree of Adduction, and nearly right-angled Pronation of the Trunk, in consequence of Rheumatism; Forceful Extension also in the Abductive Direction. Treatment by Orthopædy and Gymnastics; Essential Improvement.* This case is, in spite of Dr. Berend's long experience, especially in deformities of the hip, the only one of this kind that has ever occurred to him; and only a single deformity of the hip, although but of one side, has been described by the author in the tenth account of his establishment. The great value of a thorough diagnosis of this kind of diseases, which are so difficult to distinguish, appears as evident from this observation as the necessity of immediate forcible stretching of the hip in the highest degree of ankylotic juncture. In regard of the treatment after the operation executed, the advantage of gymnastics and orthopædy, in order to straighten that part of the body which had so long been in a perverse position, is to be put into consideration. The orthopædic apparatus invented by Dr. Berend for this purpose, which is inserted into the bed of extension, and at the same time a supporting apparatus, of which the author gives us a very fine picture, most evidently prove that it is not only the operation, but the proper treatment after it, from which a favourable result for the cure of deformities may be expected.

CASE VII. *Ankylosis of both Knees. Successful Treatment by Forceful Extension.* While the preceding case explains to us the importance of the highest degree of ankylosis of the hip, the latter presents us an inveterate ankylosis of the knee with a person of advanced age. Here we see improvement obtained in a man of fifty-eight years of age, suffering from arthritic nodosis, after he had with difficulty dragged himself along by means of crutches. Here, too, the brisement force was the only expedient, which in a few months effected an upright carriage. The latter two observations, being most unmistakably illustrated by instructive pictures, will preserve a lasting value for the pathology of deformities.

[Dr. Berend's cases are interesting; but he does not tell us that which practitioners would most desire to know: viz., the nature of the gymnastic and orthopædic treatment which he employs. Ed.]

BEQUEST. By will, the Hon. Gertrude Florinda Tollemache has bequeathed to the Middlesex Hospital all her linen and under-clothing; and plain pocket-handkerchiefs without borders or lace.

SMOKEY AIR. The Registrar-General makes the following opportune remarks on the atmosphere and thoroughfares of London:—"If coal were cheap, the greater command which the poor would have over that commodity would materially help to reduce the winter rate of mortality; and if smoke were abated at domestic fires, as well as at bakers' ovens and public furnaces, by more thorough combustion of fuel, the carbonaceous particles which they emit would not darken the air and pollute whatever they touch, nor, by forcing a passage into the throat and lungs, aggravate or excite fatal pulmonary complaints in human beings. Given a broad river, with a temperature at the time above that of the air; let there be another vast moisture exhaling the surface on its banks 60 or more square miles in extent, and this area covered with houses which pour smoke from a million of chimneys into a still atmosphere, and the result is that almost impervious fuliginous mass called 'a London fog.'"

Reviews and Notices.

ON THE DIAGNOSIS AND TREATMENT OF CANCER AND THE TUMOURS ANALOGOUS TO IT. By MAIRIE HENRY COLLIS, M.B. Univ. Dub., F.R.C.S.L., Surgeon to the Meath Hospital and County Dublin Infirmary, etc. Pp. 317. London, John Churchill and Sons: 1864.

THE eighteen chapters into which this book is divided have as titles: 1. Various Forms of Cell-growth; 2. General Remarks on the Clinical Aspect of Tumours; 3. Encephaloid Cancer; 4. Scirrhus; 5. Atrophic Scirrhus; 6. Lardaceous Scirrhus; 7 and 8. Treatment of Scirrhus; 9. Canceroid Tumours; 10. Fibro-plastic and Myeloid Tumours; 11. Recurrent Fibroid and Fibro-nucleated Tumours; 12. Fibrinous or Hemorrhagic Tumours; 13. Colloid Tumours; 14. Fibrous Tumours; 15. Epithelioma; 16. Cystic Tumours; 17. Adenoid Tumours; 18. Melanosis.

In the first chapter, Dr. COLLIS describes the characters of various forms of cells, and expresses his opinion that all these, benign and malignant, are not separate entities, but variations of the healthy lymph-cells; between which and the special cells of cancer and of fibrinous and fibrous and fibro-plastic tumours, all gradations are to be met with. He points out, and endeavours to formulate, that the observation of the resemblance of the cells of a tumour to the healthy lymph-cell, or of their divergence therefrom, is of practical clinical utility.

"The nearer the constituent cells of a tumour approach to the healthy lymph-cell in form and power of development, the more clinically benign is the tumour; the farther they are removed in these two particulars from the healthy type, the more destructive or malignant is the growth. To this I would add the further observation, that tumours of rapid growth, and with a tendency to recur, have round or oval cells, which are rapidly reproduced, and have small powers of development in the direction of fibres, while the more chronic tumours, as a rule, are composed of cells which have more or less tendency to form fibre. By a combined use of these formulae or laws, a correct conclusion may generally be deduced as to the rate of growth of any given tumour, and its tendency to return, even when its clinical history and features are unknown to us. It is not, however, expedient to get the habit of examining tumours microscopically, without as accurate an acquaintance as possible with their clinical aspect." (Pp. 4-5.)

In the second chapter, the author gives a classification of tumours founded on their structure. He divides them into two classes: viz., those tumours which are mainly composed of cells, including encephaloid and scirrhus cancer, fibro-plastic, fibroid or recurrent, and fibrous tumours, and epithelioma; and tumours in which the cellular element is not of primary importance, including cystic and fatty tumours, enchondromata, and bony tumours.

In his remarks on Epithelioma, Dr. Collis gives reasons for not considering the affections as cancerous or canceroid. It is not, he says, originally an infiltrating growth; and "its superficial origin, its slow progress, its indisposition to infiltrate the deeper structures or to contaminate the glands, the certainty of cure which follows its timely removal, and the

different appearance of cancer when occupying similar localities, are of sufficient importance to outweigh the points of resemblance which it undoubtedly bears to cancer in its advanced and secondary stages."

The author of this work has ably combined the observations of recent writers on the pathology and treatment of tumours with his own. The utility of the book is increased by the record of cases, and by the introduction of numerous well executed coloured plates and woodcuts.

ESSAYS AND REPORTS ON OPERATIVE AND CONSERVATIVE SURGERY. By RICHARD G. H. BUTCHER, Surgeon and Lecturer on Clinical Surgery to Mercer's Hospital, Dublin. Illustrated by Lithographic Plates (coloured and plain) and Engravings on Wood. Pp. 933. Dublin: 1865.

THE readers of the *Dublin Quarterly Journal of Medical Science* will be familiar with many of the surgical essays contained in this volume. These are now revised and reprinted, together with abundant new matter: the whole constituting a remarkable display of the energy and ability of one man, and a not less distinguished record of actual experience in almost every branch of practical surgery.

As might be expected, the foremost place in the book is accorded to the subject of Excision of the Knee-joint. Commencing with Mr. Fergusson's revival of the operation in 1850, Mr. BUTCHER supplies his readers with everything necessary to be known concerning the proceeding down to his last recorded case in September 1863. The high appreciation which his views have already met with from the profession on this particular question, does away with the necessity of our following him step by step over the ground he has so cautiously trodden. We give, therefore, a summary of those rules which, according to his latest experience, ought to guide the surgeon when the operation is had recourse to. These are:

1. The bones must not be diseased far beyond their articular surfaces.

2. The H-incision should be preferred.

3. "The patella should be taken away in all cases, whether diseased or not."

4, 5, and 6. Have regard to the prevention of "intermediary hæmorrhage"; the adjustment of the limb on the operating-table, and its final security, being assured by the box-splint.

7, 8, and 9. Enjoin the non-disturbance of the limb for several days. Drainage-tubes are to be used in case of abscesses, and the "free administration of stimulants and sedatives" are "imperatively demanded in all cases of excision, regulated, to a certain extent, by age, sex, temperament, and habit."

The further discussion of one point, and one point only, seems avoided by Mr. Butcher: Is not the growth of the limb checked by excision of the joint in childhood? We believe that the answer to this must yet be in the affirmative, in the absence of evidence of the contrary being established. As to whether the little limb is better than a wooden one, as maintained, *per fas et nefas*, by Professor Fergusson, in his last year's lectures before the Royal College of Surgeons, when commenting on the published observations on this "want of growth" of Dr. Humphry and Mr. Pemberton, this is matter on

essay of Professor Zenker to our readers as an important contribution to the knowledge of typhus fever and zymotic diseases in general.

There has also appeared the concluding portion of the second volume of the *Anatomy of Man*, by Hubert Luschka, the Professor of Anatomy at the University of Tübingen. This part is a stately volume, and treats of the pelvis and the organs contained in it. It is adorned with sixty-two beautifully executed wood-cuts, which, by their originality and clearness, remind us of the copper-plates of Camper and Smellie. The text is a masterpiece of arrangement and style; and accomplishes an apparently impossible task—namely, to make the study of anatomy from a book an interesting pastime or an useful effort. We cannot give any higher praise to this work, than that it has enticed us to read many chapters right through, merely for the purpose of enjoying a piece of natural history at the hands of one of its most accomplished teachers. We can conscientiously say, that physicians and surgeons cannot get a better book of reference than Luschka's *Anatomy*. The book has another advantage, in that here and there heavy matter is seasoned with the salt of Latin and Greek quotations. These efforts have succeeded more to our liking than those of Hyrtl.

A monograph by Dr. W. Erb, assistant-physician in the Medical Klinik at Heidelberg, treats of the Physiological and Therapeutical Effects of Picric Acid. The author gave picric acid mostly combined with alkalis; so that his results and his doses must be understood to refer to picrates. He found that, when taken by the stomach, it dyed nearly all the tissues of the body, and was excreted with the urine. When larger quantities were absorbed into the blood, many red corpuscles became destroyed; the white ones, on the contrary, were augmented, and a kind of artificial leucocythæmia was the result. The author also speaks of a kind of artificial icterus caused by the picrates; but it is not clear whether he designates thereby the yellow coloration due to the imbibition of the picrates, or a coloration caused by colouring matter of bile. While small doses of picrates can be borne for a long time, large doses produce symptoms of inanition and death. Fifteen grains of picrate of potash or soda is a moderate dose for an adult. But children and feeble persons require very small doses, and those must be administered with great caution. The only tangible effects of picrates are of an anthelmintic nature. They are most strongly pronounced against the *tænia serrata* of the dog. The *tænia solium* of man is also expelled by its use with tolerable certainty; of the *tænia saginata*, pieces only, and never heads, come away after its use. It is excellent against the *ascaris lumbricoides*; less powerful, but still effective, particularly in the form of clysters, against the *oxyuris vermicularis*. *Trichinae* and *cysticerci* are not affected by it. Inter-mittent fever is in no way altered by its use. [Erb evidently was not aware of the use which London cow-keepers make of picric acid. They use it, in combination with turmeric powder dissolved in old ale, as

a purgative drink for cows ("tamrie and icy piecie drink.")]

The Report of the Sixth Annual Meeting of the Central Society of German Dentists (*Germanische*, "tooth-physicians"), which was held at Munich on Aug. 1st, 2nd, and 3rd, 1864, has been published. The scientific meetings were held in the apartments of the Academy of Sciences. The first discussion concerned anæsthetics and their use in dentistry. The suboxide of nitrogen (*pulgo*, laughing-gas) came in for a large share of attention. After much discussion, Snærsen of Berlin read a paper on the Preparation for Stopping of Teeth in which the Pulp is Bare. After several subjects of great practical value had been discussed, Schrott of Mühlhausen communicated his system of obtaining the most certain impressions and the most accurate articulation. The Report is full of matter which must be of great interest to dentists. In its last meeting, the assembly awarded two prizes—one to the author of a competitive popular essay on the Hygienic Treatment of the Teeth; the other to Schrott of Mühlhausen, for his paper and demonstration.

Aniline and aniline dyes have now become articles of wholesale manufacture, on the continent as well as in England. In West Prussia, many cases of poisoning occurred round places where these articles were manufactured. It was found that they arose from careless manipulation of the arsenical residues obtained in the manufacture of the dyes. The work of Dr. Sonnenkalb, *On Aniline and Aniline Dyes, from a Toxicological and Hygienic Point of View*, contains all the information on this subject which can at present be obtained.

Bärensprung's work on *Hereditary Syphilis* has been published after the death of its accomplished author. He completed the manuscript during a lucid interval in the mental derangement with which he had lately been seized; the insanity returning, he put an end to his life by drowning. The book he has left gives evidence of his great power of observation, and the extensive range of his practice. The work is accompanied with seven plates.

The *Preussische Medicinal-zeitung* has ceased to exist; and its staff and connection are merged in the *Berliner Klinische Wochenschrift*.

Even in Germany, the quarterly publications are becoming too slow for the impatient and impetuous pioneers of science; and the monthlies are consequently in the ascendant. But the greatest success is the *Berliner Klinische*, which comes out weekly; and mostly contains good and interesting matter, and sometimes well written essays.

The *Pharmaceutische Zeitung* gives a series of articles on the affairs of the apothecaries in Prussia. That kingdom, containing 18,500,000 inhabitants, has 1580 apothecaries' shops, all privileged and under supervision; there is, consequently, one shop for every 12,000 inhabitants. The population buys medicines at these places at the rate of one shilling ($\frac{1}{3}$ of a dollar) per head per year. There are about 7500 practitioners of medicine in Prussia; and their aggregate

income now may be calculated at 5,000,000 dollars *per annum*. It will be remembered that the apothecaries in Germany are not permitted to practise, in any sense, as curers of disease; but must confine themselves strictly to the dispensing of prescriptions written by medical men. These arrangements are now imitated very closely in the empire of Russia.

Professor Griesinger of Zurich has been called to fill a newly created chair for psychiatrics at Berlin, and to take charge of the klinik for mental diseases.

It is rumoured at Berlin, that Leyden, the author of a work on Progressive Paralysis from Disease of the Spinal Marrow, will be called to the clinical chair at the University of Königsberg.

DECEMBER 15, 1864.

Alopecia Areata, followed by Universal Loss of Hair. By T. BALMAN, M.D. It was remarkable that a disease which had received so much attention, and had not been very inaccurately described by many of the older writers, should still have to be classed among the most obscure, and least understood, of the whole group of cutaneous maladies.* Very contradictory opinions were held regarding the appearances presented by the disease. Willan, Good, Hutchinson, Bazin, Burgess, and Turner, distinctly asserted that the bald circular patches, one of its characteristic features, were, for the most part, smooth, white, and shining, and never exhibited any indications of redness, pustules, or scurf; whilst Todd, Anderson, Devergie, and others, considered that the skin from which the hair falls was almost always changed both in structure and appearance: being red and inflamed, often puffy and oedematous. Dermatologists were equally at issue regarding its causes. Robin, Gruby, Bazin, Küchenmeister, and Anderson, believed the disease to be one of parasitic origin; whilst the great majority of English observers, including Wilson, Hutchinson, Startin, and Jenner, appear not to have discovered nor to believe in the existence of the fungus first described by Gruby in 1843, and named by him the *microsporon Andouini*. Its contagious character was admitted by one party, denied by the other. Those who believed the little parasite to be the cause of all the mischief had no difficulty in adducing evidence of its spread, by contact or otherwise, among members of the same family. The English school, with one or two exceptions, stood alone in denying that the disease was ever communicated in this way.

The records of medicine supply but a very few examples of the complete loss of hair, whether resulting from alopecia or from other causes.

* Alopecia, porrigo decalvans of Willan and Bateman, is mentioned by Asclepiades, Archigenus, Galen, and Celsus.

A case is given by Hardy occurring in a child. (*Leçons sur les Maladies de la Peau*, par le Docteur Hardy.) Devergie, with his great experience at St. Louis, appears to have met with only one rather doubtful case of this kind. (*Traité Pratique des Maladies de la Peau*, par Alphonse Devergie.) J. P. Frank saw it in a young man; and instances of its sudden occurrence are mentioned by Paulini and Heister. (See also *Journal de Physique*, t. xiv; *Berlin Méd. Trans.*, vol. iii, p. 372; *Journal de Progrès*, t. xiv, p. 244; and Otto's *Pathology*, by South, p. 120.)

The following lately came under Dr. BALMAN's own observation; and its history clearly showed, that it commenced with well defined patches of baldness, and was unquestionably, at its commencement at all events, a case of true alopecia.

R. H., aged 33, a man of about the middle stature, and in robust health, stated that he was a cabinet-maker by trade, unmarried, and a native of Scotland, having resided in England only a few months. His family had generally been reputed healthy, and for the most part had lived to a ripe old age. In July 1861, his attention was first accidentally drawn to a small bald circular spot, of about the size of a sixpence, on the back part of his head, a few inches from the left ear. Other spots of a similar kind soon showed themselves below, and subsequently on the opposite side of the head; they never coalesced, nor, to the best of his recollection, did they ever exceed the diameter of a two-shilling piece. Some months later, he observed, for the first time, that his hair was gradually becoming thinner, more particularly from the vertex downwards; and on looking at his brush and comb one morning, he noticed that they were covered with an unusual quantity of loose hair, and very shortly afterwards discovered, to his great consternation, that it was all rapidly falling away. The denuded patches first noticed were never red or tender to the touch; and, but for the loss of hair, he probably would not have noticed them.

In March 1862, seven months from the commencement of the disease, every hair had vanished from his body—except that one solitary stranger on the right side of his face had survived the wreck. It looked remarkably vigorous and well, and seemed little disposed to follow the bad example of its kin. With this exception, not a hair of the smallest size was to be found on any part of his body. Whiskers, eyebrows, eyelashes, genitals—all were completely naked.

There was nothing in his present or antecedent state of health to account for this sudden phenomenon. His health had been always good; and he had continued his occupation up to a very recent period.

The scalp looked perfectly white, smooth, and unusually glossy, and was rather more firmly adherent to the cranium than was usual. He had never seen the slightest indications of any scurf, pimples, or discoloration; and only very faint traces of the hair-follicles were perceptible.

The only peculiarity noticed was a partial state of anesthesia of the scalp. This was obvious enough on the application of either the acetum lyttæ, or a strong concentrated tincture of iodine, of which he scarcely took the slightest notice for very nearly twenty minutes; even then he remarked that he scarcely felt that any application had been made to his head at all.

He wore a wig as a protection from cold, and to conceal his deformity. The only other inconvenience he felt was in dusty weather, when his eyes sometimes became red and troublesome from particles of dust coming into contact with them.

The course of the disease in this instance was ex-

which surgeons may fairly differ in accordance with the particular merits of any given case. But the fact remains, nevertheless, as laid down many years ago by Mr. Syme, and too fully confirmed since to justify doubt: "The growth of the two limbs is not equal."

Mr. Butcher thought otherwise when he wrote in 1857. Our regret is, that he is so silent on this subject in 1865.

From the knee, the author passes on to the Elbow and Wrist-joint: the Conservative Surgery of the Hand; the Excision of the Upper and Lower Jaws; and concludes this section of the book, occupying 357 pages, with an account of Certain Cases of Excision and Removal of the Shafts of the Bones.

Under these various heads, the surgeon and the student will alike find a storehouse of practical information, gathered at the bedsides of patients, and recorded with eloquence and truth for their guidance.

For the other subjects considered in this very able addition to our works on practical surgery, we mainly recommend our readers to the book itself, satisfied that no operating surgeon should be without it; as not only are the historical and surgical peculiarities of every case most fully related, but every detail of dressing, of daily treatment and complication, are discussed in such a manner as to convey exactly the knowledge wanted by the inquirer having to deal with diseases of similar magnitude and importance with those described by Mr. Butcher.

Amongst the most important may be mentioned. Wounds of Arteries and their Treatment; and, as a part of this, in particular, On Wounds of the Palmar Arches of Vessels. The author is decided as to the treatment he would adopt in these latter cases: graduated pressure, flexion, and (if necessary) ligature of the brachial. This view, we take it, will commend itself to most surgeons; though it is curious how great diversity of opinion exists amongst authorities on the question. Nor is this diversity confined to mere opinion; at least, it was not in London, when the case of wound of the ulnar artery in the palm, and its treatment, under the care of so eminently experienced a surgeon as Mr. Skey, is borne in mind. (*Lancet*, vol. i. 1855, p. 574.)

Syme's and Pirogoff's Amputation at the Ankle-joint; Amputation at the Knee-joint and at the Knee; On the Treatment of Fracture of the Thighbone, and in the Vicinity of the Ankle-joint; The Treatment of Hare-lip; are titles of essays which follow—the last mentioned containing some most valuable hints on how and when to deal with complicated cases.

In the paper on Lithotomy in the Infant and the Child, the details of seven cases of successful lateral operation are given, at ages varying from $1\frac{1}{2}$ years up to 9. In all these cases, the forceps were conducted into the bladder on the blunt gorget. Mr. Butcher thinks the gorget will "travel through a smaller space" than the finger. We, however, deny this. He goes on to say:

"The forceps passed along the finger seem more showy to lookers-on; but greater security is ensured to the patient by conducting the instrument through the hollow of the gorget; therefore, the latter must be received and considered most practical." (P. 747.)

This is, in our judgment, an unnecessary precau-

tion. No fact is, perhaps, better established amongst English lithotomists of the present day, than the almost unerring certainty of consent with which the forceps follow the finger into the bladder on the withdrawal of the staff. The great aim of modern surgery has been to simplify the character and reduce the number of instruments used in operations. Lithotomy, as carried out by Liston in the past, and Fergusson and his disciples in the present, may certainly lay claim to be first on the list in this respect.

We regret we are precluded, on account of space, from referring to several other subjects of interest which bring this volume to a close.

But enough has been written to show the estimate in which we hold Mr. Butcher as a surgeon and an author; and we repeat our conviction that this work embodies, in a remarkable degree, those practical elements the publication of which confers distinction on their author, and on the great school of Dublin; and that—which is of far more importance—great advantage will be derived from its perusal by the profession.

HANDBOOK OF DENTAL ANATOMY AND SURGERY, for the Use of Students and Practitioners. By JOHN SMITH, M.D., F.R.C.S., Surgeon-Dentist to the Royal Infirmary, Edinburgh. Pp. 136. London: 1864.

OF the eight chapters of which this little work consists, the first three are on the Anatomy and Physiology of the Teeth and Maxillary Apparatus; the fourth on Dentition; the fifth on Dental Diseases; the sixth on Extraction and Instruments; the seventh on Filling or Stopping Teeth; and the eighth on Anaesthetics.

To commencing students of dentistry, this work will no doubt be useful. The matter is concisely expressed, and very simply—sometimes, indeed, especially in the anatomical portions, in a very elementary manner. But practitioners, we think, are likely to require more information than is conveyed here.

Dr. SMITH deserves thanks for his attempt to remove from his pupils the preliminary difficulties attending the study of dentistry. It will give them a very fair introduction both to the scientific and the practical study of their profession.

ON THE EARLY SYMPTOMS OF PHTHISIS, and the Means best adapted to Prevent or Arrest its Development. A Graduation Essay. By P. W. LATHAM, M.D., Fellow of Downing College; Physician to Addenbrooke's Hospital, etc. Pp. 48. Cambridge and London: 1864.

IN this essay, Dr. P. W. LATHAM proposes:

"1. To discuss the nature of tubercular deposit in the lungs, and the changes which it subsequently undergoes.

"2. To point out and establish the fact, that nature does frequently effect a spontaneous arrest, not only in the early, but even in the advanced stage of phthisis.

"3. To show what are the exciting causes and the early or premonitory symptoms of tubercular deposit; and,

"Lastly, what means, hygienic or medicinal, should be adopted to prevent or arrest its further development."

The views expressed by the author are sound and practical. In speaking of the treatment, he insists strongly on the importance of hygienic measures—nutritious food, good ventilation of the patient's habitation, and regular exercise. Without these, he very correctly says, "medicine is utterly powerless and useless, and the treatment of the disease perfectly hopeless."

Progress of Medical Science.

MIDWIFERY AND DISEASES OF WOMEN.

EXTRAUTERINE PREGNANCY IN A WOMAN WHO HAD UNDERGONE CÆSAREAN SECTION. In 1863, Dr. Hillmann of Bonn performed the Cæsarean section on Frau K., who had all the symptoms of progressive molities ossium. In February 1864, being in the eighth month of her pregnancy, she fell against a hard article of furniture; after which the fetal movements were no longer felt. In the night of February 12th, labour-pains set in, with discharge from the vagina. On attempting to make a digital examination, Dr. Hillmann found that, on account of the narrowness of the space between the rami of the pubic bones, he could introduce his finger no further than the vaginal entrance; the os uteri could not be reached. He thought it possible that rupture of the uterus might have occurred, with escape of the child into the abdominal cavity; but the general symptoms which should denote such an occurrence were absent, and the labour-pains continued, although feebly. The fetal heart-sounds and movements could not be perceived. The labour-pains gradually ceased; and Dr. Hillmann waited, but in vain, for their reappearance as an indication for further operative proceedings. In eight days, the external enlargement of the abdomen, especially in the ilio-cæcal region, assumed an erythematous appearance; the part was tender to the touch, and felt as if there were œdema of the subcutaneous areolar tissue. At the same time, febrile symptoms appeared; and, as the epidermis desquamated, the patient had occasional sanguineous discharges from the bowels, which required the use of strong injections of acetate of lead to arrest them. On February 27th, an abscess appeared between the umbilicus and symphysis pubis. It broke, and discharged a quantity of fetid liquor amnii. On introducing the finger, Dr. Hillmann felt the body of the fetus immediately behind the abdominal wall. Subsequently, the right hip of the child, denuded of its epidermis, presented at the opening and was removed by Dr. Hillmann. Fearing that the continued pressure on the abdominal walls might lead to their laceration, he, after the bladder had been spontaneously emptied, extended the abscess-opening upwards and downwards for about six inches. The child was found entwined by the umbilical cord; it was a male, of about a month less than full term, and was dead and putrid. The placenta was found attached in a space between the abdominal wall and the anterior part of the uterus; it was removed with some difficulty, but without hæmorrhage. There were no fetal membranes attached to the placenta, and none had been discharged from the vagina. Dr. Hillmann puts it as a physiological question whether the serous membrane of the abdomen may not have discharged the duty of the membranes. The wound was closed, and dressed with infusion of chamomile. The progress of the patient was satisfactory; on March 8th, she was able to leave her room for the first time, and in six weeks the catamenia appeared, and after-

wards returned at regular intervals of three weeks. On examination of the abdomen in September, the cicatrices of the two incisions were seen crossing each other at a very acute angle. In that left by the first Cæsarean section, the tissue had given way, so as to produce a hernia. On making a vaginal examination in the middle of October, and gently pressing on the hypogastric region, the anterior lip of the uterus could be felt. The patient was in as good health as could be expected in the circumstances. (*Berliner Klinische Wochenschr.*, 21 Nov., 1864.)

PUERPERAL ERYSIPELAS. Dr. Hervieux gives the following conclusions at the end of a paper on this subject. 1. Like common erysipelas, puerperal erysipelas may assume various forms—phlyctenoid, phlegmonous, and gangrenous. 2. It may affect all parts of the body, but it is chiefly met with on the seat, face, and limbs. 3. Puerperal erysipelas is sometimes sporadic, sometimes epidemic. 4. Its causes are local and general. When erysipelas occurs in the buttocks, the local causes are the irritation produced by abundant and fetid lochial discharge, sloughs of the vulva, or erythematous or phlyctenoid ulcers in the sacral region; erysipelids of the face and scalp is produced by eczema or impetigo of the nose, lips, or ears, by ophthalmia, stomatitis, or angina; erysipelas of the limbs has for its causes suppurative phlebitis or purulent deposits in these parts. The general causes of puerperal erysipelas are overcrowding, infection, and perhaps contagion. 5. Puerperal erysipelas is sometimes accompanied by severe general symptoms, which may be mistaken for those of peritonitis or of uterine phlebitis with purulent infection. 6. The prognosis of the disease varies according to its form and situation, to the complications which attend it and the causes which have produced it. The phlegmonous and gangrenous forms are more severe than the erythematous and phlyctenoid. Erysipelas limited to the face is the mildest of all; erysipelas of the seat and lower limbs is ordinarily much more severe than that of the face or even of the scalp. 7. Erysipelas supervening during pregnancy is rarely fatal; but it may produce premature labour. 8. In the treatment, the patient must be removed from the influence of the causes, both local and general, which have produced the disease. (*Gaz. Méd. de Paris*, 28 Janvier, 1865.)

CONTINUANCE OF LIFE OF THE FÆTUS AFTER THE MOTHER'S DEATH. Professor Breslau has attempted to solve the question, how long can the fetus live after the mother's death? by means of experiments on the lower animals. He details and tabulates twenty experiments, the great number being performed upon Guinea-pigs. The following conclusions are drawn:—1. The life of the fetus always endures with a certain independence after the mother's death. 2. The life of the fetus in the dead mother is very quickly in great danger, which reveals itself in strong convulsive movements. 3. "Apparent death," into which the fetus commonly falls in the first minute after the mother's death, may be continued in the uterus in extreme cases as long as eight minutes; but mostly death occurs much earlier. 4. The fetuses removed, "apparently dead," from the body of the dead mother, are nearer to death than to life, for they do not recover by themselves, but quickly, almost without exception perish. 5. Only seldom, and in the most favourable case, will the young be removed alive within five minutes after the mother's death. Even in the third minute the probability of extracting a live fetus is very small. 6. If we operate later than five minutes, we cannot extract a living fetus; if we operate later than eight minutes after the mother's

death, not even an "apparently dead" fœtus can be extracted; the young are by that time dead. 7. The mode of death of the mother seems not to be without influence upon the life and death of the fœtus. Death by asphyxia is unfavourable to the fœtus; death by hæmorrhage more favourable, so also death by chloroform, and by paralysis of the nerve-centres. 8. It appears to be of consequence for the persistence of life whether the fœtus be mature or immature, but the experiments could not determine this matter. With regard to the applications to the human fœtus and to practical obstetrics, Dr. Breslau submits that: 1. There is no doubt that the human fœtus, like the brute, always survives its mother when the mode of death is rapid and violent, as from bleeding, blows on the head, apoplexy, etc. 2. Daily experience shows that the power of resistance of the human fœtus is greater than that of the brute. 3. The duty of every physician is, after the ascertained death of the mother, to perform the Cæsarean section as quickly as possible, in order to save the child's life. The Cæsarean section may, however, be avoided when the previous death of the fœtus is certain, or when the fœtus may more readily be delivered by the natural passages. 4. The Cæsarean section will give no prospect of a living or of an "apparently dead" child, if not performed within the first fifteen or twenty minutes after the mother's death. 5. If the mother have died from disease, as from cholera, typhus, puerperal fever either during pregnancy or labour, scarlatina, smallpox, etc., there is no hope of saving the child's life. The same will be the case in those poisonings of the mother which effect a rapid decomposition of the blood, and which affect the child, as by hydrocyanic acid. Chloroform-death appears to be an exception, since chloroform, as such, does not pass into the fetal circulation, of which one may be convinced by any labour completed under chloroform-narcosis. In the discussion upon the memoir in the Berlin Obstetrical Society, Professor Martin observed that in none of the four cases in which he had performed Cæsarean section after the mother's death was a living child extracted. In one the operation was completed within ten minutes; in one it was done "very soon;" in the remaining two it was done within half an hour. Dr. Boehr referred to a collection of cases in *Caspar's Wochenschrift*, in which out of 147 cases only three instances of living children occurred. (*British and Foreign Medico-Chir. Review*, January 1865.)

SPONTANEOUS PELVIC VERSION IN SHOULDER-PRESENTATION. Dr. Gignoux relates the following case as having occurred in his practice. Jeanne M., aged 27, was taken in labour at 5 A.M., at the full term, with her third child. On examination, at 10 A.M., the right shoulder was found to be presenting; the head could be felt through the abdominal walls in the left iliac fossa; the fetal heart was heard a little above the pubes. The uterine contractions were very painful and frequent, but the labour made little advance. At midday, not the shoulder, but the arm, was presenting; the head had ascended, and the heart was heard at a higher point than before. Painful and apparently ineffectual uterine action continued; and, at 3 P.M., the serotum and anus could be felt. The head was felt in the epigastrium; the heart-sounds were loudest at the level of the umbilicus. At this time the contractions became less painful, and more regular and effective. The os uteri dilated rapidly, the liquor amnii was discharged, and the labour was successfully terminated at 5 P.M. The infant was healthy, and of moderate size. The mother died in eight days of metro-peritonitis. (*Gazette Médicale de Lyon*, 1 Dec. 1864.)

WE beg to remind the members of the Association that the annual subscription is now due. Payment of the same can be made either to the Honorary Secretaries of Branches; or to the General Secretary, T. Watkin Williams, Esq., 13, Newhall Street, Birmingham.

British Medical Journal.

SATURDAY, FEBRUARY 25TH, 1865.

IS ALCOHOL FOOD?

SOME of our readers may perhaps be aware that the views concerning the non-alimentary character of alcohol laid down by MM. Perrin, Lallemand, and Duroy, have been combated by Dr. Baudot. Dr. Baudot asserts that alcohol is food.

M. Perrin, however, cannot allow the assertion of Dr. Baudot, respecting the alimentary character of alcohol, to pass uncontradicted: and, therefore, in a letter to the doctor, re-affirms the correctness of the statements made by himself and Lallemand and Duroy; viz., that alcohol neither undergoes transformations nor is destroyed in the body: but that it is eliminated as alcohol by different organs of secretion, and that it has none of the characters of an aliment.

Dr. Baudot objects to M. Perrin, that if alcohol be wholly excreted from the body, he ought to be able to collect the total quantity which, in any given experiment, has been ingested. But to this, M. Perrin answers, that the human body is not a crucible or a retort; and that to fix the finely divided vapour of alcohol which passes off from the lungs and skin is utterly impossible. And even if we were to obtain from the secretions eighty *grammes* out of a hundred *grammes* of alcohol ingested, how would that advance the question? You would still maintain that the remaining twenty *grammes* were destroyed in the body as food. And if, again, by distilling the blood and the organs of the body, we were to obtain the missing twenty *grammes*, you would then object: Oh! the body has not had time to convert the alcohol into food.

Previously to the date of our experiments (says M. Perrin), it was generally accepted, that alcohol ingested could not be found again in the body—not even a trace of it; and the conclusion was that alcohol was a food. But the discovery, that alcohol ingested can be found in all the secretions of the body, of necessity destroys the argument upon which that conclusion was based. The arguments derived from the fact—that alcohol is a ternary body, is very combustible, burns better than fat, starch, and acetic acid, etc.: that the animal machine possesses powers of chemical transformations which art cannot rival;

that alcohol exists so widely spread through nature; that the alimentary character of alcohol is of universal belief; that Liebig explains its use, and Bouchardat admits it; etc.—are all arguments wide of the mark. The theory of the combustion of alcohol in the body has no other scientific base to rest upon, than the absolutely negative one derived from the researches made to discover its presence in the body.

When we undertook our investigations (says M. Perrin), we firmly believed in the opinion then generally held; but when we found the alcohol present in every part of the body, and in all the secretions, we naturally altered our views. We argued thus. All substances taken into the body may be divided into two classes—those which aid nutrition, and those which do not aid it. Although it may be difficult to define these classes absolutely, there are attached to each of them certain sufficiently characteristic marks. Food, whether ternary or quaternary in composition, under the action of living chemistry, rapidly loses its identity, and is absorbed. Except under very exceptional conditions, it is never found in its original form, either in small or in large quantity, in any of the excretions. Contained in the blood, and circulating with it, it exercises no appreciable influence over the functions of different organs; its action is lost in the silence of vegetative life; and then, after a certain term, and under the influence of catalysis, it is removed from the body under the form of different secondary combinations. On the other hand, non-alimentary substances undergo no transformations in the blood, they are foreign bodies, which the body tries to be rid of, which disturb the healthy functions of the body, and which are, therefore, rejected with the excretions.

By the aid of these typical characters, we test the properties of alcohol. We find, in the first place, that alcohol, unlike food, passes into the blood, and is present there as alcohol and as a foreign body. In the second place, alcohol, unlike food, is eliminated from the body in the different excretions as alcohol, the elimination being constant, and commencing almost immediately after its ingestion, whatever be the quantity taken; the elimination, moreover, goes on as long as the blood and the organs of the body are impregnated with alcohol. In the third place, alcohol, unlike food, undergoes no transformations in the body, and furnishes no product of oxidation. In the fourth place, alcohol, unlike food, demonstrates its presence in the body by certain special effects, which are always of a like kind, and may be of mortal intensity. In the fifth place, alcohol, unlike food, accumulates in certain organs—the nervous centres and the liver—which, consequently, contain, weight for weight, more of it than the blood.

Hence, then, we unreservedly maintain that alco-

hol is not an aliment—1, because it exists and remains unaltered in the blood; 2, because no trace of its destruction or transformations can be found in the body, nor in the pulmonary exhalation, nor in the fact of calorification; 3, because it is eliminated unchanged by all the organs of excretion; 4, because the phenomena excited by it in large or feeble doses, its accumulation in the nervous centres, and its toxic and well known pathogenetic action, show it to have a modifying power over the nervous forces, and show it not to be an aliment; and 5, and lastly, because the objection drawn from the circumstance, that we are not able to obtain the whole of the alcohol ingested, considered physiologically, is ill founded; and even, if it were admitted, it would only show that some of the alcohol has disappeared in its passage through the body (and in the manner we have described). But, assuredly, no proof can be drawn from this that the alcohol is either destroyed or has undergone combustion.

From all these objections, however, to the alimentary character of alcohol, M. Perrin does not draw the inference that alcohol is a deadly enemy to human nature. On the contrary, he rejects the conclusion which M. Baudot would thrust upon him, that alcohol, if not a food, must be useless and hurtful to the body. We believe (says M. Perrin) the very reverse of this.

“In demonstrating that alcohol is neither a succedaneum of starch nor of cod-liver oil, but a kind of dispenser of nerve-force, we have rather enlarged, specialised, and ennobled its uses, than diminished its value. Regarded from this new point of view, everything is explained, everything touching the organic effects or functional disturbances produced by alcoholic drinks justified. It is by its action on the nervous system that, taken in small doses, it excites in exhausted man such a marvellous and instantaneous re-integration of his force. It is by its action on the nervous system that, in the form of generous wines, it develops that reaction, that sense of comfort, which the best selected teetotal dinner (*diner aquatique*) will never produce. It is by its action on the nervous system that it occasions poisonous effects when taken in excessive quantity. And, lastly, it is by their action on the nervous system that alcoholic beverages are of indirect but very powerful service as regulators and moderators of the nutritive functions—as we hope one day to show you.”

Such is the answer given by M. Perrin to the doctor who has ventured to attack the non-alimentary theory of alcohol. We fear that our teetotal friends will hardly approve of the conclusions of M. Perrin in reference to the virtues of alcohol. M. Perrin and his late co-experimenters have heretofore been accounted of the greatest authority amongst those who forbid the use of alcohol. What will be said of M. Perrin if, at some future day (as he promises), he tells the world of all the great services afforded to nutrition by alcohol, *in a secondary way*. We shall be anxious, indeed, to see how M. Perrin will prove the high use of an article, which he

himself says is "a foreign body, which the system tries to get rid of, and which disturbs its healthy functions"!

PENSIONS TO POOR-LAW MEDICAL OFFICERS.

OUR brethren in England, and especially our Poor-law medical officers, would do well to take note of the efforts at present being made in Ireland to obtain retiring pensions for Poor-law medical officers. These efforts should receive their warmest support; for it is certain that the English Poor-law medical officer, whilst aiding his Irish brother, will be doing himself a service. The attempt now being made in Ireland to obtain superannuation for medical officers *who do not devote their whole time to the service of the union*, if successful, will be a battle won for the Poor-law medical officers of England. In 1862, Sir R. Peel introduced a Bill into Parliament "for granting superannuation allowance to Poor-law officers." This Bill was, however, withdrawn. Last month, the subject was again prominently brought forward by a most important and powerful deputation which waited upon the Lord Lieutenant in Dublin. A memorial, setting forth the reasons why a superannuation fund should be granted to Poor-law medical officers, was then presented. The arguments given in it are as follows.

"1. That whilst, under other departments of the Poor-law, six or seven hours a day are considered as constituting an officer's whole time, and entitling him to a pension, the Poor-law medical officer gives far more than this; for, in addition to several hours of regular duty per day (Sundays not excepted) devoted to his workhouse or dispensary, he must hold his whole time, as well by night as by day, available to the calls of the public service, to the postponement or even exclusion of private professional claims.

"2. That the duties discharged by Poor-law medical officers expose them in an especial manner to those agencies that produce contagious disease, rapidly endangering life, as well as bodily infirmity, for which a superannuation allowance should be given.

"3. That the salaries attached to the Poor-law and dispensary medical appointments are so small, and the duties so pre-emptory and absorbing, as to incapacitate the medical officer, in a large majority of instances, from making any provision for infirmity or old age by remunerative private practice; and that, consequently, medical officers are compelled by necessity (in the want of a retiring allowance) to persevere in holding their appointments when, by reason of age or infirmity, they can no longer do so with satisfaction to themselves or advantage to the public.

"4. That all risk of abuse in granting such superannuation would be effectually guarded against by enacting that such grant should be under the fiat and control of the Poor-law Commissioners."

This memorial was strongly supported both by the Presidents of the College of Physicians and the College of Surgeons of Ireland, and by Dr. Mackesy

and others. Dr. Mackesy told the Lord Lieutenant that a "deputation which had waited on Sir Robert Peel had fully satisfied him of the justice of including the medical officers in any superannuation fund for Poor-law officers."

We would urgently recommend our medical brethren, therefore, to use all their influence to support any measure embodying this desirable object which may come before Parliament. No man in Ireland has done more to support the cause of the Poor-law medical officer than our distinguished associate Dr. Mackesy; and, in this attempt to procure a superannuation fund for the Poor-law medical officers, we find him still a veteran, nobly and disinterestedly fighting for the welfare of his medical brethren.

THE acting assistant-surgeons have been (all of them, we believe) gazetted out of the service—bundled off, as we forewarned them they would be, most unceremoniously. They have only had their proper reward. The Irish medical element has been so freely supplied to the army of late, that Dr. Gibson and the Duke have been able to dispense with the class of medical men who occupied a position in the scale of knowledge several degrees below the third class. Third-class men are the *beau ideal* of men for the army, in the Director-General's opinion; and now, thanks to numerous applicants, he has a full supply of the class he affects so warmly!

THE Lunacy Commissioners, in their Report of the Suffolk Lunatic Asylum, speak in strong language of its excellent management by Dr. Kirkman.

"We had every reason to be well satisfied with the state in which we found the patients, observing throughout numerous indications of the care and attention given to their comfort and well-being by Dr. Kirkman. We are glad again to report *very* favourably of the condition and management of this asylum."

The points which were particularly noted by the Commissioners are the following.

"We heard no complaints of ill-treatment on the part of the attendants and nurses, who seemed to us to be very kind and judicious in the performance of their duties. No patient on either side of the house was in seclusion, and only two were in bed. The amount of seclusion since the last visit has been very small, and there has been no mechanical restraint. We are glad to find that the same large proportion of the inmates are taken out for walks beyond the premises, and that it is intended this year to take an increased number of them to the sea-side. The wards were throughout very clean, and the bedding excellent. We noticed with pleasure that there were no special contrivances to palliate the faulty habits of the patients. Acting on the same principle, Dr. Kirkman has fitted up and papered the wards used by the most impulsive patients in exactly the same manner as the best wards; and the result has been a marked improvement in the patients' habits, with little or no destruction of the furniture or decorations."

WE learn from the Report of Dr. Monat, the Inspector-General of Jails in the Lower Provinces, Bengal, for the year 1863-64, that with an average number of prisoners (17,957), there were 1,711 deaths, amounting to a *mortality of about nine and a half per cent.* The ratio per cent. of sick in hospital to strength, 167.52. The sanitary condition of the jails has not been so good as in former years. This was caused partly by the prevalence of cholera, and in some jails by the extraordinary prevalence of a very virulent form of fever, which was epidemic at the time in Lower Bengal. One reassuring point in the Report is the statement that the jail establishments have manufactured articles, within the last few years, to the value of nearly six lacs of rupees (£58,000). The net profits for the year were about £22,000. In eight jails, the prisoners earned for the State more than they cost—a fact worthy of study by all those interested in the subject of convict and prison discipline. The entire number of jails have returned, within eight years, above a third of the total prison expenses—a sum of twenty-three lacs of rupees—as the result of the labour of the convicts.

THE Academy of Sciences has given the following prizes. 1000 *francs* to M. Balbiani, for his Researches into the Constitution of the Germ in the Animal Ovum before Fecundation; 1000 *francs* to M. Gerbe, for his Researches concerning the Reproduction of Kolpodes; 500 *francs* to M. Sappey, for his Researches into the Structure of the Ovary; 2500 *francs* to M. Zenker of Erlangen, for his work on Trichiniasis; 2500 *francs* to M. Marey, for his work on the Circulation of the Blood; 2500 *francs* to MM. Martin and Colineau, for their treatise on Coxalgia; 1000 *francs* to M. Ollivier, for Clinical and Experimental Researches on Saturnine Albuminuria; 1000 *francs* to M. Lemaître, for his Researches into the Properties of Atropine and Daturnine; 1000 *francs* to M. Willemin, for his Experiments on Cutaneous Absorption in Baths; 1000 *francs* to M. Lancereaux, for his Pathological Researches on Cerebral Thrombosis and Embolia; 1500 *francs* to M. Grimaud, for his Hygienic Researches; 5000 *francs* to M. Roussel, for his History of Pellagra; and 2000 *francs* to M. Costallet for the same subject.

THE *Dublin Medical Press* comments as follows upon some remarks made in this JOURNAL *à propos* of Dr. Stokes's Address on Medical Education.

"A writer in the BRITISH MEDICAL JOURNAL of January 25th asks, 'Do those who obtain most esteem and reputation with the public, who are considered the most skilful, and are run after as the best curers of disease,—do they gain their esteem and repute because they are men of high attainments?' We answer, as we are sure Dr. Stokes

would, that no advocate of general education means to affirm that the knowledge of Horace, Homer, or Natural Philosophy, will enable a man to treat a fever or a fracture with success; but we do affirm that the above knowledge will expand his mental powers, tend to enlarge his views, and render it possible for him to appreciate more correctly the results of observation. Are we to be told that this exercise of his mental capacities will not have a marked influence on the development of the discriminative and diagnostic capacities of the physician or surgeon, and, in this way, tend to render his task easier and his success much more certain than that of one who, with moderate genius, has to contend against an uncultivated intellect and a mind unaccustomed to deal with the generalities of science? It will not supply a defect in the special qualities which render a man a good surgeon or physician; but it will afford him a general and abstract knowledge which at all times may be rendered practical by an observant mind."

Our cotemporary has mistaken the drift of the question we put. Assuredly we never doubted for a moment the immense advantages accruing to the individual himself from a first-rate preliminary education. What we asked was this: Do the public encourage high learning amongst us? Are those who bear away the golden palms of practice—who have the favour and the ear of the public—always men of high attainments? Does this high education do these classical or mathematical attainments—in any way recommend a man to the favour of his clients? Do they in any way assist him in his career as a successful practitioner of medicine? Is it not true that some highly gifted members of our profession have actually had to conceal the classical light which was burning within them, because it injured their professional prospects? Is it not true that we constantly see men of the most commonplace and ignorant stamp of mind brilliantly successful practitioners of medicine? This was the question which we put to Dr. Stokes; and we did it for the purpose of asking him what encouragement there was given by the public to our profession to induce its members to become learned and of high general attainments. Look at that public board of which Dr. Gibson is—nominally, at all events—Director-General—the Army Medical Service; and we find that the Board is not ashamed publicly to declare that the lowest kind of medical education suffices for the soldier's purposes; that third-class men are good enough to tend the sick and wounded soldier! We are, we believe, stating only that which every one knows to be the fact, when we say that the reform, as regards the position of their medical officers, which might have been forced upon the army medical authorities, has been defeated for the present solely through the rush of Irish candidates for the appointments. Well, these candidates for medical military honours have been received with open arms, with boastings and joy and thanksgiving, as god-sends, by the Horse Guards. But what appears to be their title to the high education of which Dr.

Stokes is so eloquent a supporter? The *Dublin Medical Press* shall answer the question.

"Considering that by far the larger proportion of the students of medicine in Dublin present themselves at the College of Surgeons for the preliminary examination, in what a responsible position does that body stand to the profession and the public for the proper fulfilment of the trust reposed in them, and how lamentable it is that it should have adopted a lower standard of general education than that required by any other examining body in the United Kingdom. The only subjects required are Latin and Greek. The first five books of Virgil and the Gospel of St. John is the extent of the course; there is no examination by writing, nor any test of proficiency in composition."

Here, then, we have the fact before us, that gentlemen from whom are required the *lowest standard of general education* are the gentlemen who are received with open arms by the managers of the Medical Department of the Army; that into the hands of the worst educated class—as we must presume—of men in the country are committed the health and life of our soldiers!

THE Medical Council will this year meet early in April. The Council have again applied for, and obtained, permission to use the College of Physicians for their meetings.

"THE sedative effects of the constant current," says M. Remak (who is now experimenting at La Charité), when the current is very feeble, "are exceedingly interesting. To produce such effects, in fact, the current must never excite painful sensations. The sedative action produced by this current differs from that of other sedatives; and it may be employed when, for various reasons, the use of opium, belladonna, etc., is objectionable. One of the most striking instances in which the current is of service, is in removing the increased sensibility of an inflamed part. If, in such a case, a positive electrode, of sufficiently extended surface, be applied over the seat of inflammation, and the negative electrode at a distant part of the body, we shall find, in the course of five or ten minutes, that the sensibility of the part has greatly diminished. Thus, for example, in a case of very painful inflammation of the elbow or the wrist, we place the positive pole over the brachial plexus, and the other over the scapula; and we find the pain is soon lessened. Lately, in the presence of MM. Claude Bernard, Velpeau, and Beau, I applied the current in the case of a man who ten days before had struck his knee, and suffered great pain at the inner border of the patella. The pain was so great, that the patient could not walk except with his knee bent. I placed the positive electrode over the crural nerve below Poupart's ligament, and the other pole over the extensors of the leg. In a few minutes, we observed that the joint became less painful, and the extension of the limb more easily

performed. The patient was completely cured by three applications of the remedy. Let me remark to all those who would repeat my experiment, that the curative effect depends upon the surface of the elements of the pile; that is to say, that piles composed of small elements must be absolutely rejected."

Phosphorus-necrosis is a common disease in Vienna. The Medical Society there has appointed a Committee to draw up a report to present to the Government on the subject. Professor Schuh, who lately presented to the Society two cases of the disease which had been cured, remarked that he did not consider the subperiosteal of as much value as was generally supposed. It is a fact, that the bones are not regenerated in man; though how it might be with animals he knew not. Of the two cases mentioned, one was that of a young woman who had worked for a long time in a match manufactory, and from whom he had removed the whole of the under jaw-bone. He first of all removed only the left jaw-bone; but, as the necrosis extended to the right side, he afterwards removed the other half. The other was a case of necrosis of the upper jaw.

Rokitansky lately brought under the notice of the Vienna Medical Society the subject of Torsion and Strangulation of Ovarian Tumours. During the last few years, he has seen eight cases of this kind. His observations lead him to the conclusions—1. That torsion and strangulation of ovarian tumours are not uncommon; 2. That they sometimes come on suddenly, at others gradually; 3. That in the first case they are generally fatal to life. 4. When the tumour, previously moveable, suddenly becomes fixed, and there arise symptoms of peritonitis, we may surmise that torsion, etc., have occurred. In such case, attempts must be made to replace the tumour. 5. Intestinal incarceration may also result from the same causes. 6. Destruction of the tumour may also follow, and may account for the disappearance of ovarian tumours in some cases.

Typhoid fever is the cause of the greatest number of deaths in French military hospitals, being, for the year 1862, 185 per 10,000 of effective soldiers. Suicide appears to be very common in the French army; it is three times greater in the army than amongst civilians. In 1862, there were 231 suicides in the army. Syphilis is in France, as in England, the most cruel scourge of the army.

M. Velpeau places the recommenders of secret remedies to the Academy of Medicine in this fix:

"One of two things. The persons who recommend these new remedies have not tried them, and in such case they can know nothing of their effects; or, if they have tried them, they have rendered themselves liable to punishment for illegal practice of medicine. So far, therefore, from receiving recompense from the Academy, they should be punished by the law."

SIR CHARLES WOOD AND THE INDIAN MEDICAL SERVICE.

A PERUSAL of the despatch from Sir C. Wood on the Medical Department confirms the views we have expressed, that the new scheme will tend to the extinction of the local medical service. The doctors, perhaps, have no more reason to complain that their occupation is gone, than have the officers who cast in their lot with the local army. The absorption of the old race of Company's servants, and the filling of their places by strangers who knew not "The Honourable John", is a mere question of time. Whether it was necessary, in doing this, to repeat the foolish twaddle of a foolish earl, and thereby to insult publicly a large body of honourable and high-minded public servants, is a matter for the nation to decide. Sir C. Wood has inflicted an unnecessary amount of pain in the performance of this his latest operation, whereby he acquiesces in the dictum of the War Minister, that the Indian medical officers are of too low a caste professionally to admit of admixture upon equal terms with their brothers of the Royal army. The insult has been deliberately made; and it remains to be seen whether the service will pocket the affront, in consideration of the olive-branch held out to it in the shape of a few extra rupees, and somewhat more favourable facilities of retiring into private life.

It remains for us to consider briefly what the "benefits" of the new despatch to medical officers are. The figures at first sight look imposing on paper. The pay of deputy inspectors-general, for instance, is increased from 1,575 rupees to 1,800 rupees, the present Bengal rate; but at the same time the Indian Government is informed "that a readjustment of the local department of inspection, to meet the altered condition of the service," which means that the "reduction" is to be at the expense of the Indian medical service; and that for every deputy-inspector reduced, the British medical service will have a valuable appointment bestowed upon it. The members of the Indian medical service are so obtuse that they cannot see the advantage of increasing the pay of, say, four deputy-inspectors from 1,575 rupees to 1,800 rupees; and at the same time reducing the number of appointments from eight to four, thereby diminishing the prospects of promotion of those now in the service to the higher grades exactly by one-half!

The immediate effect of the new rule will probably be a complete stagnation in promotion to the higher ranks. If the circles of inspection are to be reduced in number, there will be several supernumeraries "out of employ", all of whom will, of course, be brought in as vacancies occur; and, naturally, every one will try to hold on for "five years" in the grade of deputy-inspector, so as to secure the extra pension held out by the new rules.

It is a curious fact, that all the late attempts at "improvement" of the medical service have been marked by the loss of valuable appointments. The new warrant threatens the further extinction of one "inspector-general" and three or four "deputies". It is evident that, if these "improvements" are to go on, there will shortly be nothing left for the services to look forward to beyond the rank and pay of "surgeon-major". It of course will be said that "the altered conditions of the service" do not require so many administrative officers. This may be true enough; and the medical officers may allude to the fact, in asking that the same consideration may be shown to them as to the colonels and majors who

were "no longer wanted", and who were allowed to retire upon handsome bonuses.

It seems to us that, by the introduction of the new rules, there will be a superfluous staff of senior surgeons. It is evident that forty-four regiments of native infantry and cavalry cannot give suitable employment to a staff of eighty-six surgeons. Those who are not wanted—whose prospects of promotion have been utterly blasted by the new rules—should, we submit, be tempted to move out of the way by a more liberal scale of retiring pension than the one now offered. Having ruined their prospects of advancement, the Government should, in mercy, allow them every facility for retiring into private life, and forgetting their real or fancied wrongs. (*Madras Athenæum and Daily News*.)

Special Correspondence.

CONTINENTAL NEWS.

[FROM OUR OWN CORRESPONDENT.]

THE monograph by Professor Zenker of Erlangen, *On the Changes which the Voluntary Muscles Undergo in Typhus Fever*, the publication of which had already been announced to us by the author, has appeared. Our readers may recollect that it was while prosecuting the researches contained in this essay, that Professor Zenker discovered trichiniasis. There is some danger that the more sensational one of the two discoveries with which his labours were rewarded will, for a time at least, withdraw the attention of the medical public from the intrinsically more important one relating to typhus fever. And this is, perhaps, no more than natural, seeing that trichinæ had puzzled the learned for thirty years, and that now, by one grand masterstroke of science, the world is put in a position, not only to know all about them, but also to do all that is requisite for preventing their propagation.

The discovery which relates to typhus fever, on the other hand, does not admit of any immediate application to the treatment or prevention of that disease; but is important rather as a basis for further researches. The changes of the muscular tissue which take place in typhus fever may mostly be ranged under two heads—granular disintegration and waxy confluence. In the first variety, the transverse striæ disappear, and the sarcolemma appears filled with finely granular matter. In the second variety, the striated matter becomes, as it were, pervaded by a coagulating material, which sets, and in contracting breaks up the fibres into great numbers of short waxy looking lumps, not unlike a certain variety of casts of the tubuli recti of the kidneys. Muscles thus changed do not present the red colour of flesh, but a peculiar fawn or yellow tint, permeating the ordinary red in patches and veins not unlike the appearance of vein-marble. This aspect is well represented in a coloured plate. Other plates represent the microscopic appearances in the affected muscles. Zenker regrets that he was unable to combine with his researches a chemical inquiry into the changes of the muscular tissue. We recommend the

ceedingly obscure. No gastric derangement or disturbance of any organ or function existed, so far as could be ascertained; and the case could hardly be said, therefore, to have been a constitutional disorder, in the strict sense of the word. As to its parasitic origin, how far the first manifestation of the disease was due to any such cause, it was not easy to say; but Dr. Balman thought that it would be absurd to suppose that so rapid a destruction of hair as took place in this instance could by any possibility have been the work of a minute cryptogamic plant, even if we were to admit the full influence and importance of such a class of causes in producing the disease in question.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

TUESDAY, FEBRUARY 14TH, 1865.

W. R. BASHAM, M.D., Vice-President, in the Chair.

ON THE TREATMENT OF CHRONIC DISEASE OF THE LUNGS BY THE INHALATION OF ATOMISED LIQUIDS.

BY MORELL MACKENZIE, M.D. LOND., M.R.C.P.

[Communicated by T. B. CURLING, F.R.S.]

THE author, after an elaborate description of the various instruments invented for the purpose of introducing medicine by means of inhalation, entered into an account of the apparatus invented by Dr. Siegel* (of Strasbourg) and himself, which he thus described. It consists of a little kettle with a horizontal spout, in which there is a very fine opening. Placed at right angles to the horizontal spout is a vertical tube which dips down into the kettle, with a spirit-lamp placed beneath it. As the steam issues from the spout it causes a vacuum in the vertical tube, and the medicated liquid rising up becomes mechanically incorporated in the steam. The dilution of the medicated liquid which takes place is very slight, as the conversion of a drachm of water into steam will take up three drachms of medicated liquid. The temperature of the steam is lowered by the incorporation of the liquid, so that at the end of the cylinder it has only a temperature of about 70°. In this apparatus there is of course no current of cold air. The amount of liquid taken up varies; that is, it depends on the amount of heat applied, on the height of the column of liquid, etc. This is not an important defect, but when it is thought desirable to take up a definite quantity of liquid the author uses the following apparatus. A graduated glass tube, about eight inches high, has from its lower part a fine piece of tubing, which is bent round and up again, and then extends about an inch horizontally, and ends with a minute opening. In the vertical portion of the fine tubing there is a stop-cock. The small aperture of the tube is placed at right angles to the spout of the kettle, and as the liquid emerges it becomes incorporated in the steam. By means of the stop-cock the amount of liquid which passes from the tube can be regulated, so that the same amount can always be taken up in the same time. Dr. Siegel's simple apparatus is an excellent one, and the author stated that he had often used it with great advantage.

The author observed that his own atomiser is very simple and can be used very easily. The liquid is driven from a fine glass pipe on to a projection in a bell-shaped tube, by the descent of a piston. The piston is drawn up without any exertion by a wheel and rack, at its upper part, and is forced down by a circular spring which surrounds the cylinder. The ap-

paratus is filled with liquid by a funnel in its top, and all the spray except that which is inhaled passes back into the apparatus. The advantages of his (Dr. Mackenzie's) atomiser are:—

1. Its simplicity, requiring only a few turns of a handle to set it in operation.
2. The extremely fine state of subdivision which it effects.
3. The uniform pressure exerted.
4. The fact that the waste liquid returns into the apparatus.
5. The ease with which it can be taken to pieces and cleaned.

After enumerating the physicians and physiologists who had worked at the subject on the continent, the author analysed the experiments which had been performed by Demarquay, Fournié, Brian, and others, on rabbits and dogs. He then related his own experiments, which had been carried out in conjunction with Dr. Duchesne, of Woodford.

After detailing various experiments performed on pigs and dogs, Dr. Mackenzie thus summed up the results. Leaving Demarquay's rabbits out of the question—it having been shown by Claude Bernard that, as those animals in their normal state breathe through the nares when their nostrils are covered, and they are made to breathe through the mouth, the conditions are not physiological; and by Fournié that any solution (not atomised) injected into a rabbit's mouth passes into the lungs—there are (1) Demarquay's and Brian's experiments on dogs; (2) his (Dr. Mackenzie's) on pigs and dogs; (3) an experiment performed by Demarquay in the presence of numerous witnesses on a woman with tracheal fistula, in which it was shown that the inhaled liquid penetrated to the trachea, though there was a great obstruction at the upper opening of the larynx—this experiment, which had been previously unsuccessfully performed by Fournié, has since been repeated by Lieber, Schnitzler, and others, with results similar to those obtained by Demarquay; (4) the fact first shown by Bataille, and since by Moura-Bourouillon, the author, and others, that after the inhalation of a coloured atomised solution the sputa remained tinged long after the employment of the laryngoscope could detect any traces of the material used. On the one hand there were an immense number of positive proofs of the penetration of atomised liquids; on the other hand there were a few experiments performed with negative results. It was scarcely necessary to remark that any experiment might be performed—the most simple chemical test employed—in a manner to ensure failure. But a few experiments of this sort could have little weight against the mass of evidence on the other side.

The author stated that the greatest benefit from this system of therapeutics might be expected, and had resulted, in bronchitis, asthma, and hæmoptysis. He brought forward twenty-two cases treated between October 1863, and January 1864. There were ten cases of bronchitis, six of phthisis, two of hæmoptysis, three of asthma, and one of whooping-cough. The author did not believe that in phthisis the treatment would have a positively curative effect, but was beneficial in cutting short intercurrent bronchitis.

Of the twenty-two cases detailed, only two were unable to make use of this curative process. Of the ten cases of bronchitis, eight were cured, one relieved, and one obtained no benefit. The average duration of the time required for curing these cases, though most of them were severe and of long standing, was only fifteen days and a quarter. The shortest time was six days (a severe case, No. 4); the longest forty days. The duration of treatment was not in proportion to the severity of the disease; one mild case requiring twenty-eight days to get well. Of the

* This admirable apparatus has unfortunately been patented by Dr. Siegel.

six patients labouring under consumption, two were unable to use the inhalations on account of the irritation which they caused. Of the remaining four cases, whilst the physical signs did not undergo any material alteration, the local symptoms (expectoration, pain, and cough) were greatly relieved. The general health was much improved in two cases, Nos. 11 and 15; slightly in a third, and not at all in a fourth. In two cases of hæmoptysis, one severe, the other slight, the atomised liquids rapidly stopped the bleeding. In three cases of asthma—one, a very severe case, which had obstinately resisted the ordinary treatment, this system of therapeutics soon gave relief. In one case of whooping-cough (in an adult) the inhalations gave immediate relief, and quickly effected a cure.

The author stated that during the past year he had used atomised liquids in more than eighty cases of diseases of the lungs, and that he had found the plan of treatment no less successful than was detailed in this paper. The various instruments referred to in the communication were brought before the Society, and likewise diagrams illustrating their action and method of employment.

determined, whether absorption is essential to this action, and wherein it differs from other purgatives; whether it be true, for instance, that castor-oil acts on the whole canal, aloes chiefly on the lower end, calomel chiefly on the liver. If we knew any such laws, they would be of immense value; but they must be made out inductively, if at all.

On the other hand, it was at one time believed that we had traced, as a law of the action of mercury, that it caused the absorption of effused lymph; and every one, in treating a case of inflammation with fibrinous effusion, felt bound to prescribe calomel and opium. This law, however, seems not to have stood the test of further inquiry; at all events, I can nowhere find the induction by which it is proved.

No one will dispute the accuracy of Dr. Mayo's statement, that it is impossible to apply the same tests to many of the facts in pathology and therapeutics which are employed in such a science as that of chemistry; but my object has not been so much to teach the exact bearing of inductive reasoning on medical science, as to point out that the philosophy of induction has been lost sight of altogether, and that the existence of causation is generally assumed without any attempt being made to prove it in a legitimate manner.

If Dr. Mayo will refer to the pages of any of the homœopathic journals, he will find cases carefully and fully recorded in which the treatment is detailed, and the recovery of the patient attributed to the employment of a third dilution of nux, or a tenth trituration of arsenicum, etc.—whatever such language may mean. The cases to which I allude will bear comparison with hundreds detailed in medical periodicals, or even in the standard works of medical literature; and if the recovery of a considerable number of cases after the use of certain remedies be admitted as evidence of their curative action, there is no alternative, as it appears to me, but to admit that these "dilutions" and "triturations" are curative. We may demur to the hypothesis; but if we do not require of all treatment whatsoever that it be shown that there is a distinct relation of cause and effect, we have no sound argument to prove the utter uselessness of homœopathy. It is not my intention to waste the time of your readers by attempting a refutation of this oft exploded folly; but to any one who will take the trouble to read the writings of their more reasoning and better instructed correspondents, a most useful lesson will be taught by the parody of induction exhibited in the "proving" of remedies, and by the extraordinary jumble of fact and fiction which takes the place of deduction in their hypotheses.

I think we cannot too clearly understand that there ought to be and must be a firm basis laid in inductive reasoning for our medical beliefs; and if I could have any longer carried on the controversy with Dr. Johnson, I think I could have shown him that such a basis was wanting to his theory. That he may not regard me as untruthful, I beg to refer him to page 265 of his own volume, whence I copied words, the accuracy of which he questions. The only aim I have had in bringing forward instances of inconclusive reasoning has been to stimulate others to strive after greater accuracy. Far be it from me to claim for myself any superior degree of logical acumen, or to set up my own reasoning as a model for others to copy. The inductive philosophy rests on a basis which I believe to be indestructible, and when its principles are understood, it is not difficult to bring any argument propounded to the test of experimental inquiry, and decide whether it complies with its requirements. In the hope that some few

Correspondence.

MEDICAL ERRORS.

LETTER FROM A. W. BARCLAY, M.D.

SIR,—It is highly gratifying to find that my views of medical reasoning have to so great an extent received the approbation of such an original thinker and intelligent observer as the late President of the Royal College of Physicians. Dr. Mayo will, I am sure, forgive me for saying that he seems, in some measure, to have mistaken me when he assumes that I should require proofs of causation which the very nature of the case rendered unattainable. He also seems to me, perhaps unnecessarily, to shrink from following out to their full limit some of the teachings of philosophy, which, as they prove that a degree of uncertainty clings to all the practice of medicine, might unsettle the faith of some who have no substitute for the dogmatism of the schools, if that be shown to rest on an insecure basis.

It is perfectly true that, in very many cases, we are unable to apply the canons of Mr. Stuart Mill to our rules of practice; but I have more than once stated in my volume, that medicine, in its application for the cure of disease, must be chiefly deductive. I do maintain, however, that, if it is to rank as a science, it is absolutely necessary that we should base all the inferential and analogical reasoning which guides our practice on laws which have been arrived at by correct induction. When the law of the action of any remedy has been ascertained, it is very easy to apply it in the management of a case; and the skill of the practitioner is chiefly shown in the judicious employment of the means most suited to accomplish the end of promoting the recovery of the patient. For example, we know that the action of certain substances in the body is purgative; and, if we think the evacuation of the bowels likely to be beneficial in any given case, a purgative is ordered. The determination of the necessity, and the selection of the remedy, can never be made the subjects of inductive reasoning; but the law of the purgative action may very well be so. In fact, it is as clear an induction as can be traced anywhere in science, that a dose of castor-oil will purge unless its action be somehow or other interfered with. It is still to be

among us may be stimulated to make ourselves still more familiar with its teaching, I do most earnestly commend this branch of study to my fellow-workers and fellow-students. I am, etc.,

A. W. BARCLAY.

23A, Bruton Street, February 21st, 1865.

INVESTIGATION OF DISEASE.

LETTER FROM A. RANSOME, M.B.

SIR,—It is possible that the object of the paper "On the Need of Combined Medical Observation" may not be thoroughly understood by some of your readers, and disappointment may result from want of clear apprehension of the means which I am anxious to see employed.

Many important medical problems cannot be solved by detached individual observation; the weight of evidence necessary to true induction can only be amassed by associated labour. Thus, Dr. Durrant's "Retrospective Notes" on the action of remedies, etc., are valuable, as giving the carefully noted results of his experience; but they need corroboration by many others, before sound conclusions can be drawn from them. And these observations must be made with method, in concert; and must be organised by skilful leaders. To carry on the metaphor quoted by Dr. Durrant, it is not by our present desultory guerilla warfare that we shall prevail over our difficulties: our forces must be drawn together and headed by officers who will direct the operations, marshal the facts, and, most important of all, who will carefully examine our weapons, and exclude all weak or inefficient materials.

I have ventured to express the opinion that the central governing body of our Association would most fitly perform this important duty, and have urged that they should appoint a subcommittee "to devise the best means of obtaining the evidence of members of the Association upon questions having a practical bearing."

The Association is now promoting a most worthy object—the formation of a Provident Fund for medical men; but surely it would not be less worthy or less important that we should combine for other than internal work; that we should attempt to remove from the profession the stigma of uncertainty upon subjects which at the present day ought not to be permitted to remain undecided.

If the Council would take the lead in this matter, there can be little doubt that they would be well supported by their members, and a most useful society of observation would be formed. We might hope not only that a rich harvest of results would be gathered in, but the labourers themselves would get good by the labour, and would gradually strengthen and train their powers of observation.

The work, however, must be well organised, and needs careful guidance; otherwise we cannot hope to obtain that well tried and carefully sifted evidence which is required. I am, etc.,

ARTHUR RANSOME.

Manchester, February 14th, 1865.

[Is our correspondent aware that a Committee was appointed at the London meeting of the Association in 1862, for the very object to which he refers? That Committee drew up very careful schedules of queries concerning the actions of remedies on diseases; but their labours have not been duly rewarded. Might it not be well to start again upon the same basis, with any improvement which experience may have suggested? EDITOR.]

MEDICAL EVIDENCE AT CORONERS' INQUESTS.

LETTER FROM JAMES EDMUNDS, M.D.

SIR,—As imputations have been cast upon me in respect to my mode of giving evidence at coroners' inquests where the reputation of other medical men has been concerned, and as such imputations, although utterly groundless, have obtained a wide publicity, I shall be glad, as a member of the Association, if you will favour me with the insertion of the inclosed copy letter; and I am prepared to furnish evidence to the same effect from several other medical gentlemen with whom I have come into contact as medico-legal witness deputed by the coroner, and with whom I have not the honour to be otherwise acquainted.

If any gentleman feels aggrieved by my want of caution when occupying so responsible a position, I shall be happy to meet his complaint, if submitted in writing to the British Medical Association; the condemned party to pay ten guineas to the Medical Benevolent Fund, and make such other amends as the adjudicators may impose.

I am, etc., JAMES EDMUNDS.

52, Gower Street, Bedford Square, February 1865.

"22, Essex Street, Islington, February 20th, 1865.

"My dear Sir,—I well remember your evidence at the inquest of one of my policemen, whose family accused me of neglect in the case, because I did not go to see him myself about every two hours through the night... I had great reason to thank you for your honest and manly evidence, and your determination to uphold the character of the medical profession.

"Believe me, dear sir, yours faithfully,

"J. B. MATHER,

"Surgeon G Division of Metropolitan Police.

"Dr. Edmunds."

A BAD LOT. The following medical officers of the United States army have been cashiered. Assistant-Surgeon Owen, 16th New York Heavy Artillery, for stealing from the United States, and embezzlement, and defrauding the government: to be dishonourably dismissed the service, with loss of all pay and allowances due him from the United States. It shall be deemed scandalous for an officer to associate with him. Surgeon J. H. Thompson, 124th New York Volunteers, for cowardice. Assistant-Surgeon John V. De Grasse, 35th United States Coloured Troops, for drunkenness on duty, and appropriating to his own use liquors belonging to the medical department. Assistant-Surgeon James Henderson, 201st Pennsylvania Volunteers, for appropriating to his own use medical supplies, and appearing before officers and enlisted men in a state of intoxication. Assistant-Surgeon Avery, 3rd Missouri Cavalry, for habitual drunkenness and neglect of duty. Assistant-Surgeon Christian Miller, of the 8th United States Coloured Troops, having been put in charge of the transportation of one hundred and fifty, as he admits, wounded men who had nothing to eat all day, as he reports, left Deep Bottom without making any preparation for their comfort or providing for them food, and when reaching Bermuda Hundred was found personally intoxicated from, as he says, a grain and a half of morphine, and a half gill of whisky, so as to be unable to do his duty, is ordered by Major-General Butler to be and is dismissed the service of the United States with the loss of all pay and allowances. Assistant-Surgeon N. S. Drake, 16th New York Cavalry, for messing and drinking with enlisted men.

Medical News.

ROYAL COLLEGE OF PHYSICIANS OF LONDON. At a general meeting of the Fellows, held on Monday, February 20th, 1865, the following gentlemen, having undergone the necessary examination, and satisfied the College of their proficiency in the science and practice of medicine, surgery, and midwifery, were duly admitted to practise physic as Licentiates of the College:—

Foster, John Bunyan, 66, Upper Charlotte Street, Fitzroy Square
Glyn, Thomas Robinson, 35, Canonbury Road, Islington
Griffith, William, Oswestry
Günther, Charles Theodor, M.D. Tübingen, Hampton Wick
Hudson, John, Rochester
Lamb, George, Hull
Marshall, John
Murphy, J. Wm. C. Neynec, Aldershot

At the same meeting, the following gentlemen were reported by the examiners to have passed the first part of the Professional Examination for the Licence:—

Bart, William Jennings, St. George's Hospital
Butler, William Harris, Guy's Hospital
Joseph, Thomas Morgan, University College
Reuslaw, Edwin, St. Bartholomew's Hospital
Ridout, Charles Lyon, St. George's Hospital
Underhill, Francis William, St. George's Hospital
Watson, George Samuel, St. George's Hospital
Withers, Walter Owen, King's College

APOTHECARIES' HALL. On February 16th, 1865, the following Licentiates were admitted:—

Burnham, Ralph, Pre-ton, Holderness, Yorkshire
Carr, Charles, Newcastle-on-Tyne
Gould, Franklin, Charlotte Street, Bedford Square
Higden, George William, Durgate Street, Canterbury
Robertson, Robert, M.D. Edin., Liverpool

At the same Court, the following passed the first examination:—

Lloyd, Ridgway R. S. C. C.

APPOINTMENTS.

BARNES, Henry, M.D. Edin., elected Resident Medical Officer to the General Hospital for Sick Children, Manchester.

ARMY.

CRANE, Assistant-Surgeon E. J., 90th Foot, to be Staff-Assistant-Surgeon, *vice* T. S. Barry.
MATHEW, Assistant-Surgeon C. B., 51th Foot, to be Staff-Assistant-Surgeon, *vice* C. J. Weir, M.B.
TROTT, Staff-Assistant-Surgeon R. W., M.B., to be Assistant-Surgeon 54th Foot, *vice* C. B. Mathew.
WEIR, Staff-Assistant-Surgeon C. J., M.B., to be Assistant-Surgeon 90th Foot, *vice* E. J. Crane.

DEATHS.

*MARTIN, John F., Esq., at Abingdon, aged 60, on February 14.
SOPER, At Stockwell, on February 19th, aged 2 months, William, son of *William Soper, Esq.
WILKINSON, Charles, Esq., Surgeon, at Southgate, aged 73, on February 9.
WILLOERS, Frederick W., M.D., in Stamford Street, Blackfriars, aged 36, on January 29.

DEATH OF M. GRATIOLET. Professor Gratiolet, who a week before was lecturing at St. Sorbonne, has suddenly died of apoplexy.

MEDICAL CORONERS. The contest for the vacant coronership of the northern division of the County Dublin lies between two medical men—Mr. G. F. Davis, Assistant-Surgeon 50th Regiment, and Dr. Davys of Swords.

VACCINATION IN MARYLAND. A correspondent informs us that the law of Maryland requires that vaccination shall be performed with matter not more than four removes from the cow. (*Philadelphia Medical and Surgical Reporter.*)

KING AND QUEEN'S COLLEGE OF PHYSICIANS. The President of the King and Queen's College of Physicians in Ireland held a *conversazione* on Monday evening in the College Hall. The Lord Lieutenant was present, with various members of the vice-regal household; also the Lord Chancellor, the Lord Mayor of Dublin, the Attorney-General, the President of the College of Surgeons, Major-General Lloyd, and numerous Fellows and Members of the College. The band of the 84th Regiment was in attendance. Various interesting specimens, scientific and historical, were exhibited.

KNIGHTHOOD OF DR. A. TAYLOR. The *Memorial des Pyrénées* contains the following paragraph:—"In consequence of an application (unofficial) which the French Ambassador in London made by order of the Emperor to the Government of Her Britannic Majesty, Queen Victoria has been pleased to order letters patent to be made out conferring the dignity of Knight of the United Kingdom of Great Britain and Ireland on Mr. Alexander Taylor, M.D. This high distinction has been accorded to Dr. Taylor by the Queen in recompense for the services rendered by him to his countrymen and to the town of Pau." Dr. Taylor formerly served on the medical staff of the British Legion in Spain, under Sir De Lacy Evans.

BEEF AT THREEPENCE PER POUND. Last week we attended at the London Tavern, and made trial of various dishes prepared from the beef imported by the South American Beef Company. Of the soups we may speak in the highest praise, and the curries were not to be despised. The *bouilli*, the least satisfactory of the dishes, was scarcely inferior to what we have eaten at continental *tables d'hôte*. We hope this entertainment will serve to dissipate all the doubts which various people have held as to the possibility of making the beef palatable as well as nutritious. It simply requires time and care in cooking. We must add that the Company now supply the beef in powder, or ground with peas, so that strong, highly nutritious soups can be prepared without the trouble of long boiling. (*Chemical News.*)

THE INDIAN MEDICAL WARRANT. The *Calcutta Times* correspondent says: "The new medical warrant, which looks so liberal, has been generally received by the service as doing bare justice to the older members in the matter of pensions, as taking away all hope from the younger men of the prizes, which will now be the lot of Queen's surgeons, and as virtually keeping out of it hereafter all gentlemen by localising it. The native papers are accordingly delighted at the prospect of getting for natives good appointments in the local service, which Englishmen will henceforth scorn. They say the unjust order which shut them out of the general medical service, even when they had passed the examinations in England, is now practically removed."

METALLIC TRACTORS AGAIN. *Metallopathy* is just now being revived in Paris. It means the cure of nervous affections by the application of metallic plates to the seat of pain. The reviver of the practice is Dr. Dufraigne, who relates the following extraordinary cure. He had invited a dinner party, and among the guests was a lady, who, just as the company were about to sit down, was seized with a violent headache. A happy thought struck the doctor. He sent for the cook, who came with a copper stewpan, which the doctor held to the lady's forehead for ten minutes, after which she was perfectly cured, and sat down to her dinner as lively as the rest. A second attack at home some days later was cured in the same simple way.

NAVAL PRIZE MEDALS. Two gold medals, of the value of ten guineas each, founded by the late Sir Gilbert Blane, have just been presented to Dr. Charles Forbes, H.M.S. *Topaze* (1860), and Dr. Andrew Graham, of H.M.S. *Agamemnon* (1861), for the excellent manner in which their respective "logs" have been kept.

COLLEGE OF PHYSICIANS. During the past year, 27 candidates presented themselves for the preliminary examination for the licence, of whom 25 were approved; 63 candidates came up for the first part of the professional examination, and of them 55 were approved; 67 came up for the final or pass examination, and of these 56 were approved.

SCHOLARSHIPS AT SIDNEY COLLEGE, CAMBRIDGE. Among other scholarships to be competed for at this college, on October 10th next, are two of the value of £40 each annually, for natural science, electricity, chemistry, geology, anatomy; an intelligent knowledge of any one or two of which, added to a fair knowledge of classics and mathematics, would probably ensure a scholarship. It may be held with another scholarship if the candidate be fortunate enough to obtain another. Information, however, is to be obtained from the Rev. J. C. W. Ellis, tutor of the college.

ODONTOLOGICAL SOCIETY. A meeting of this Society was held on February 6th; T. A. Rogers, Esq., President, in the chair. A patient was introduced by Mr. Ramsay, wearing the apparatus invented by Dr. Kingsley for cleft-palate, with the view of allowing the members to see the improvement resulting from the use of the apparatus. The patient was requested to read and speak. [Why does the reporter not tell us the opinion of the Society on the apparatus in question? EDITOR.] Pathological preparations were exhibited by Mr. Ibbetson and Mr. Fletcher. The Secretary read a paper by Mr. Cartwright and himself upon the Skulls at Hythe Church, Kent. The writers, after stating how the bones were arranged at the above church, gave reasons for disbelieving the traditional account of how they had been collected; viz., after a great battle between the Danes and Saxons. The appearance of the skulls, and the number of them that had belonged to children, and probably to females, were contrary to such a view. The maxilla principally occupied their attention. The alveolar arches were all well developed; and in quality the teeth were much finer than was usually seen in the present day. Irregularities of any kind were uncommon amongst them. In many cases, they were much worn, probably from food containing much of the outer husk of the grain and grit from the rude utensils used in preparing it. Caries existed, but to a less extent than is seen in the present day; it occurred generally on the masticating surfaces of the teeth, and was attended, in most cases, with alveolar abscess. Mr. Coleman read a paper upon Certain Forms of Irregularity and their Treatment. The object of this paper, as stated by the writer, was to bring before the Society certain views propounded by Mr. Cartwright at a former meeting, which had not been fully discussed. Mr. Cartwright's opinion was that the increasing prevalence of contracted dental arches was ascribable to increasing civilisation, with selective breeding. This view was fully adopted by the writer, who adduced a large number of observations which told in its favour; he also agreed with the same authority in the treatment of cases of contracted maxilla, with irregularly placed teeth; but, in some cases, he advocated a line of treatment not commonly pursued by dental practitioners. The discussion was adjourned till the next meeting.

OPERATION DAYS AT THE HOSPITALS.

MONDAY..... Metropolitan Free, 2 P.M.—St. Mark's for Fistula and other Diseases of the Rectum, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.
TUESDAY. Guy's, 1½ P.M.—Westminster, 2 P.M.—Royal London Ophthalmic, 11 A.M.
WEDNESDAY... St. Mary's, 1 P.M.—Middlesex, 1 P.M.—University College, 2 P.M.—London, 2 P.M.—Royal London Ophthalmic, 11 A.M.—St. Bartholomew's, 1.30 P.M.
THURSDAY..... St. George's, 1 P.M.—Central London Ophthalmic, 1 P.M.—Great Northern, 2 P.M.—London Surgical Home, 2 P.M.—Royal Orthopaedic, 2 P.M.—Royal London Ophthalmic, 11 A.M.
FRIDAY..... Westminster Ophthalmic, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.
SATURDAY..... St. Thomas's, 1 P.M.—St. Bartholomew's, 1.30 P.M.—King's College, 1.30 P.M.—Charing Cross, 2 P.M.—Lock, Clinical Demonstration and Operations, 1 P.M.—Royal Free, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.

MEETINGS OF SOCIETIES DURING THE NEXT WEEK.

MONDAY. Royal College of Surgeons of England, 4 P.M. Professor Huxley, "On the Structure and Classification of the Mammalia."
TUESDAY. Royal Medical and Chirurgical Society, 8.30 P.M. Mr. T. Longmore, "On Osteo-Myelitis consequent on Gun-shot Wounds"; Mr. Hulke, "On Ichthyosis of the Tongue."—Anthropological Society of London, 8 P.M.
WEDNESDAY. Royal College of Surgeons of England, 4 P.M. Professor Huxley, "On the Structure and Classification of the Mammalia."—Royal Medical and Chirurgical Society, 8.30 P.M. Annual Meeting.
THURSDAY. Harveian Society of London, 8 P.M. Dr. Griffith, "On a New Method for the Arrest of Uterine Hemorrhages"; also, a Clinical Discussion "On the Use of Alcohol in Fevers."
FRIDAY. Royal College of Physicians, 5 P.M. Dr. Edward Smith, Galstonian Lectures. "A Critical and Experimental Inquiry into our Knowledge of Urea in its Relation to Nutrition, Food, and other Physical Agencies in Health; and to certain States of Disease."—Royal College of Surgeons of England, 4 P.M. Professor Huxley, "On the Structure and Classification of the Mammalia."—Western Medical and Surgical Society of London, 8 P.M. Dr. G. F. Blandford, "On Melancholia."

TO CORRESPONDENTS.

. All letters and communications for the JOURNAL, to be addressed to the EDITOR, 37, Great Queen St., Lincoln's Inn Fields, W.C.

COMMUNICATIONS.—To prevent a not uncommon misconception, we beg to inform our correspondents that, as a rule, all communications which are not returned to their authors, are retained for publication.

CORRESPONDENTS, who wish notice to be taken of their communications, should authenticate them with their names—of course, not necessarily for publication.

THE DAVENPORT BROTHERS.—Judging from the way in which the Davenport Brothers have been received in Liverpool and Huddersfield, and were received in London, a correspondent suggests, that people are "not such fools in the country as they are in London."

THE FRENCH MEDICAL CONGRESS meets on October 2nd, at Bordeaux. The subjects to be discussed then and there are the following:—1. Rheumatism; 2. Treatment of Diseases by Expectation; 3. The Malignant Forms of Furuncle and Anthrax; 4. Sudden Death after Injuries, and in the Puerperal State; 5. Parasites in Man, and the way to destroy them.

FILTHY PUBLICATIONS.—SIR: By this day's post, I received a copy of one of those vile filthy publications, *A Treatise on Spermatorrhoea and its Immediate Self-Cure by the New French Method*, etc. Surely the circulation of these books might, and at all events ought to be, prevented by legislative enactments. The author styles himself F.A.S., F.S.A., F.R.A.S., Member of the College of Physicians and Surgeons, H.G. King's College, The Lock, St. Mary's, and St. George's Hospitals, etc. I enclose the last three pages of the book. Cannot our Association do something to stop these wretches? At all events, they may be exposed.

I am, etc., WM. SANKET.

TRICHINÆ.—**SIR:** Various subjects, both of general and medical interest, are canvassed and investigated by the members of the British Medical Association, in the pages of its now well conducted JOURNAL, which, under your superintendence and revision, has attained so high a standard of excellence and usefulness, as highly to merit the support of the profession generally. I trust it will be the means of inducing numbers to join the Association. Without the JOURNAL, its power and usefulness would soon decline. I hope you, sir, and our respected associates will consider the subject I am about to bring before you and them of sufficient importance to claim the attention and aid of all who are interested in the well-being of society, in the cause of humanity, especially of the poorer classes, who, I fear, are the greatest sufferers.

The subject I propose for investigation, is that of "Trichiniasis", or "Flesh-worm disease". In Germany it has excited great attention and controversy; but in "happy England", little or none. Although the "warning blast" has gone forth, it has met with apathy alone. Breeders and butchers deny the existence of any such disease, and even our best veterinarians; as Youatt and others, in describing the "intestinal worms and parasites with which swine are affected", make no mention of the "trichinæ", or "flesh-worms". This appears to the unreflecting and interested parties a sufficient refutation. Consequently, people still eat pork; and some, I believe, die of obscure diseases—the nature totally "unrecognised"—a "fearful agonising death". What can be more abhorrent and revolting than being literally consumed and eaten up alive? This is no "conjuror's trick", but an actual disgusting fact. The fate is the more deplorable, as no hope of cure can be held out, or of alleviation, to the wretched sufferer, except the swallowing of potent poisons, nearly as dangerous to life as the disease itself, or obliterating all nervous sensation by powerful narcotics—"should it be recognised".

Well may we say with the Italians:

"It is not true that death is the worst of evils,
For life is only life when blest with health."

I hope, sir, that you will agree with me, that this subject is worthy of searching investigation, and a fitting one to be carried out by the talented members of our Association, many of whom are in a position and locality favourable to such an investigation. By so doing, they will confer a boon, and deserve the grateful thanks of society, especially the poor, who, I fear, are the greatest sufferers, from feeding upon the stale remnants of pork or sausages sold by the butcher at a very low price, and often quite unfit for human food. The consciousness of the probability of saving even one of our fellow-creatures from such misery, and of preventing the spread of so dire a plague, will amply reward the toil.

The present questions I would propose for investigation, are:

1. Are English domestic pigs subject to trichinæ?
2. Are very young animals (as sucking pigs) liable to be infected?
3. Can the trichinæ be perfectly destroyed by thoroughly cooking?
4. Are they effectually destroyed by salting the meat?
5. What is the effect of time in destroying the vitality of these parasites?

If these questions can be satisfactorily answered, we shall be able to form an opinion as to the safety or danger with which we are apparently surrounded, and at all events prevent the calamity. I am, with much esteem, etc.,

FOR THE PRESENT A FOLLOWER OF THE LEVITICAL
LAW, ALTHOUGH NOT ONE OF THE TRINE; AND AN
OLD ASSOCIATE.

Leominster, Herefordshire, February 1865.

TRICHINÆ.—**SIR:** In a leading article about entozoa (in your number of February 11th), you say, that if people will eat their meat raw, like cannibals, they must take the consequences. Being born on one of the Caribbean Isles, and brought up a young cannibal myself, I am in a position to assure you that true cannibals always eat their meat well roasted, and never raw. When we ate my grandfather, his flesh came exceedingly well off the bones; and the very marrow in the thighs was beautifully hot and fluid. Moby picked it with the snuff- spoon which we took from a Scotchman. As for eating a fellow raw, cannibals may as well be suspected of gnawing their own living limbs. I have since read in a book called *Robinson Crusoe*, that my forefathers already in his time ate their enemies well cooked.

I am, etc., CANNIBAL INDEX.

[We believe our young savage friend is correct; and if he is, we will venture to affirm that cannibals are not afflicted with trichinæ or any of such affiliated horrors. EDITOR.]

SINERS FOR THE NAVAL SURGEON.—Recently, in an important ship, on an important station, the following fact occurred, as narrated by an honourable gentleman of high character. A trifling discussion arose between the second lieutenant and the staff-surgeon (the latter officer, be it remembered, ranking with a commander), on a matter not connected with the service, in which the lieutenant was completely defeated before the members of the mess, which irritated him so much, that he went on to the quarter-deck, and sent for the staff-surgeon (this superior officer). On the staff-surgeon's appearance on the quarter-deck, this lieutenant demanded his sick list. The surgeon produced his list, which the lieutenant took, and returned without opening; but saying, with a sardonic grin, as he turned on his heel: "I warn you, sir, to be cautious how you press me to argue with your commanding officer—an executive.

This occurred when the captain, commander, and first lieutenant were all on board. The staff-surgeon (an M.D., ranking with a commander, and "an excellent unassuming gentleman"), complained to the captain of this piece of arrant snobism. The captain inquired into the matter, and decided that it was the surgeon's duty to produce his sick list, *when required by any executive officer, of whatever rank*, and without questioning his reasons or motives for doing so. (*United Service Gazette*, January 21st.)

IMPORTANT MEDICO-LEGAL QUESTION.—**SIR:** I was the plaintiff in an action lately tried in the County Court in this town, in which I sought to recover the sum of £8 odd, for professional attendance and medicines rendered and supplied by my assistant, who conducts a branch surgery for me at a distance of five miles from my residence. I am registered as an Apothecary, Surgeon, and Doctor of Medicine. The judge, after a few minutes' consideration, gave a verdict for the defendant, on the ground that no qualified medical practitioner could recover for cases attended by an assistant *sine* diploma, resident five miles from the principal. I beg to submit the above to the readers of your extensively circulated JOURNAL, many of whom, no doubt, have branch practices, as I think it involves a question of great importance, not only to myself individually, but to the medical profession at large. I have had this branch practice a considerable time, and might be a loser to a considerable extent, should the decision referred to hold good. I am, etc., JOHN WILLETT, M.D.

Northwich, Cheshire, February 15th, 1865.

INDIAN MEDICAL SERVICE.—**SIR:** I enclose the orders of the Bengal Government on the despatch, and paragraph 3 fully confirms the opinion I gave of paragraph 20 of the despatch; viz., to bring in as many outsiders as possible to fill up the good appointments at the Presidencies and large civil stations.

"3. To enable the future establishment of the Indian Medical Service to be laid down, it is requested that the Governments of Fort Saint George and Bombay will forward to the military department of the Government of India a detailed statement of the number of medical officers of Her Majesty's Indian Service required for the duties of those Presidencies under the system now ordered, taking into account, as directed in paragraph 20 of the despatch of the Secretary of State, the several situations which may be properly filled by uncovenanted members of the medical profession."

I am glad to hear that so few have been attracted by the apparently tempting bait. I am, etc.,
February 1865. A RETIRED SURGEON-MAJOR.

THE GRIFFIN TESTIMONIAL FUND.—**SIR:** The following subscriptions have been further received on behalf of the above Fund:—Dr. J. Cogan (Wheatley), £1:1; Dr. F. J. Sandford (Market Drayton), £1:1; Dr. J. S. Belcher (St. George's East), 10s. 6d.

Amount previously announced, £114:8:6. Received at the *Lancet* office, £7:17:6.

I am, etc., ROBERT FOWLER, M.D.,
Treasurer and Hon. Sec.

145, Bishopsgate Street Without, February 16th, 1865.

COMMUNICATIONS have been received from:—Mr. WILLIAM CORNEY; Mr. BRODHURST; Dr. BEIGEL; Dr. B. W. RICHARDSON; Dr. DURRANT; Dr. W. H. O. SANKEY; Dr. HUMPHRY; Dr. JOHN WILLETT; Mrs. POWELL; Dr. RADFORD; Dr. DOBELL; Mr. OLIVER PEMBERTON; Dr. BALMAN; Mr. W. M. CLARKE; Dr. D. DOUGAL; THE HON. SECRETARY OF THE WESTERN MEDICAL AND SURGICAL SOCIETY; Dr. FITZPATRICK; THE HONORARY SECRETARY OF THE HARVEIAN SOCIETY OF LONDON; Dr. C. BLACK; Dr. HENRY BARNES; Dr. A. T. H. WATERS; Dr. EDMUNDS; Mr. WILLIAM MARTIN; Dr. S. H. STEEL; Dr. A. W. BALCLAY; and THE HON. SEC. OF THE ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

Observations

ON THE

CÆSAREAN SECTION AND ON OTHER OBSTETRIC OPERATIONS.

BY

THOMAS RADFORD, M.D.,

F.R.C.P. EDIN. AND F.R.C.S. ENG., ETC.,

HONORARY CONSULTING PHYSICIAN TO ST. MARY'S HOSPITAL,
MANCHESTER.

INTRODUCTORY REMARKS.

THE Cæsarean section is not an operation of recent date; its performance is recorded before obstetric medicine and surgery were scientifically accepted (vide *Edinburgh Medical and Surgical Journal*, vol. xxv), and has since been generally recognised in most of the modern systems of obstetrics. Although this is the fact, yet it has not received the unanimous approval of the members of our profession. From a very early date it has had its advocates and its opponents. To my knowledge, there has been no subject connected with medicine which has created more bitterness of feeling and animosity in the minds of those who may be classed as Cæsareanists and anti-Cæsareanists.

In no city or town in these empires have these repugnant and unprofessional feelings existed to a greater extent than in Manchester. The important but rancorous controversy which took place here between Dr. Hull and Mr. Simmons brought the greater part of the medical profession to entertain more clear and definite opinions. The writings of Dr. Hull, apart from their controversial character, contain most valuable and practical observations.

When I received the honour of appointment to deliver the first obstetric address before the Provincial (now named British) Medical Association, at the next meeting which was to take place at Manchester, I selected a practical and at that time a debatable subject; and, even at the present time, the opinions of medical men are unsettled and discordant upon it. My opinions upon some parts of the subject, no doubt, differed from the great majority of those who honoured me by patiently listening to its delivery; yet I did not hesitate freely, and I hope conscientiously, to express them. At the present time, I do not shrink from the responsibility of again bringing more fully before the entire profession my views, which had only been partially known for several years before the delivery of the address. I have the fullest confidence that the doctrines promulgated will receive the unprejudiced judgment of the profession.

I was induced to select for my subject the Cæsarean section, and those other means which have been recommended to supersede its performance, partly because these subjects have been, as already stated, warmly discussed in this city; and partly because the greatest number of cases (I speak relatively) in which the Cæsarean operation has been performed in Great Britain and Ireland, have occurred in this city and in the neighbouring districts. The analytical

tables contain a report of seventy-seven cases. Of this number, fifty-five have happened in England; of which, twenty-five have occurred in Lancashire; fifteen cases have occurred in Scotland; and seven cases have taken place in Ireland. It is a remarkable fact, that there stands no case recorded from Wales.

The following observations are entirely confined to British and Irish cases. I have purposely avoided admitting foreign cases into the tables, or of making remarks upon, or of drawing any deductions from them; although I am quite aware the maternal mortality might be shown to be considerably less by their admission for computation, than it appears by only taking the results of British and Irish practice.

In the following pages, all the questions have been faithfully and conscientiously discussed; and all the opinions which are given are, as far as possible, based on facts. My object is to endeavour to place the Cæsarean section, and some other obstetric operations, on such medical, social, and moral grounds, as to be approved by both the profession and society at large. The doctrines which I have inculcated in the following pages are only desired to be received in the spirit in which they have been written; and I desire them to be taken in no other way than as they are worthy of acceptance or rejection.

The tables which were brought before the Association contained records of many points which have been now omitted in order to reduce them. They contained an account of the number of previous labours, and the mode of delivery; the state, etc., of the os uteri; the location of the placenta, etc.; the exact line of the incision; and some general remarks on the condition of the patient before, during, and after the operation, etc. I have, however, embodied the deductions to be drawn from the record on most of the subjects above adverted to.

CHAPTER I.

On the Necessity of the Cæsarean Section as an Obstetric Operation.

IN an ill directed controversial ardour, Mr. Simmons, in his remarks addressed to Dr. Hull, declared that the Cæsarean section was universally and inevitably fatal, and proposed a compound operation of symphysectomy and craniotomy to supersede it. It was not long afterwards before he had an opportunity of putting in practice his highly lauded operation. He was consulted in the notable case of Elizabeth Thompson, whose pelvis (now in my possession) is extremely distorted. An examination of it must have brought conviction to his mind that some other means must be adopted in order to deliver her. It is to be presumed he renounced his proposed operation, as he discarded his patient, who was afterwards brought to the Manchester Lying-in Hospital, and delivered by the Cæsarean section.

Dr. Hull, at this time, endeavoured to settle the disputed question of the necessity of this operation; and the soundness and justice of his opinions were generally approved of by the profession. If this question had still remained undisturbed, it would have been unnecessary for me to interfere with this part of the subject. Within a few years, however, not only the necessity, but likewise the propriety, of its performance has been denied, and opprobrious

epithets employed (unworthy of the talented physician who used them), which, although totally unfounded, not only cast odium on the operation, but also reflect most unjustly on the character of those obstetricians who have conscientiously recommended it and boldly performed it. More recently, it has been declared by an obstetric physician, that the induction of abortion, the induction of premature labour, craniotomy, or these two last operations combined and applied according to the degree of distortion, would render the Cæsarean section altogether unnecessary.

The Cæsarean section is doubtless required whenever the pelvic apertures, or its cavity, are so diminished that a mutilated infant cannot possibly be drawn through. This diminution may be positively produced when the pelvic bones are distorted by mollities ossium, by rickets, or by irregular union of, or by a large deposition of callus on, these bones after fractures; or from exostosis, which may grow upon any portion of the bones.

The pelvis is also sometimes relatively so diminished by different kinds of large tumours which are lodged within the pelvis; some of which are loose, whilst others are immovably fixed so as to render this operation necessary.

An analytical statement of the causes which have rendered the performance of the Cæsarean section necessary in these kingdoms, will be found numerically to stand as follows. Of the seventy-seven tabulated cases, forty-three were produced by mollities ossium, of which thirty-two were English, ten Scotch, and one Irish. In fourteen cases, the pelvis was distorted from rickets, of which twelve were English and two Scotch.

In one case, the distortion was congenital (English), and was of a rickety character; in two cases, one English and one Scotch, the pelvis had been fractured.

In six cases, fibrous or other tumours existed in the pelvis; of which three were English, two Scotch, and one Irish. In two cases, there was an exostosis growing from the base of the sacrum; of which one was English and one Irish. In two English cases, carcinoma of the os and cervix uteri caused the obstruction. In seven cases, the cause is not recorded.

Nearly all the pathological causes enumerated above which render the Cæsarean section necessary are progressive; and most of them may proceed to such an extent as nearly to obliterate the apertures of the pelvis, or to block up the cavity.

I have in my possession, a distorted pelvis in which the brim is nearly destroyed, there not being a greater space between the descending lumbar vertebrae and the pubes on each side than the tenth part of an inch. The space between the lumbar vertebrae and the rami of the pubes is five-sixteenths of an inch, and the space between the jutting of the pubes near the symphysis is three-eighths of an inch.

So, likewise, exostosis, or tumours within the cavity, have grown so large as to prevent a finger from passing without great difficulty. These pelvic conditions may exist in a first pregnancy, or may come on at any time during the child-bearing period; and a woman who has had several natural and propitious labours may, in successive cases, have greater or less impediments existing, which may require different means for her delivery; or the pelvis may be naturally capacious in one labour, and in her next the

bones may be so distorted, or its cavities may be so filled, as to require the Cæsarean section.

Then, with such uncertainties as these, it is obvious that both the patient and practitioner may be completely ignorant of these organic conditions until pregnancy has either been considerably advanced, or even completed, and labour commenced.

Surely, the most benighted opponent to the Cæsarean section cannot be so mentally blind as not to know that young married women can not be compelled to submit to vaginal or other examinations in order that it may be ascertained whether there is sufficient pelvic capacity for a full-grown infant to pass through. But, supposing the practitioner to be acquainted with the state of the pelvis, the means recommended to supersede the performance of the Cæsarean section are quite inadequate to prevent its necessity in those higher states of distortion, etc., which have existed in most, if not all, of the cases which are tabulated. Ample testimony exists of the truth of the above remark in some of the cases contained in the tables.

Dr. Hull relates several cases, and within my own knowledge others have occurred, in which it was quite impossible to deliver the women after either embryotomy or craniotomy had been performed. Then, under these circumstances, what measures must be adopted for the delivery of the woman? Must she die undelivered with a mangled infant still in the womb? This event has been most unwarrantably allowed to happen. Again, ought the Cæsarean section to be performed to extract a mutilated infant? This practice has been pursued. These are weighty reasons why the Cæsarean operation should be considered as one, at least, of necessity. There are, however, other grounds to be spoken of, which further establish this proposition. No doubt every obstetrician will admit that it is absolutely necessary for the os uteri to be accessible when he intends to induce abortion: more especially, if this operation is to be performed by the aid of instruments. And when, at later periods of pregnancy, craniotomy is contemplated, it would doubtless be considered a *sine quâ non* that both the os uteri, the degree of its dilatation, and also that the presentation of the infant, should be ascertained before this destructive operation is performed. These important desiderata do not, however, always exist in cases in which the pelvis are highly distorted.

In twenty-one of the tabulated cases, the os uteri could not be felt: in twenty-one cases there is no account given, from which it is fair to conclude that it could not be touched—making together forty-two cases. In thirty-five cases, the os uteri was discovered with more or less difficulty. In sixteen cases, no part of the infant could be reached. In forty-one cases, we have no account; which omission affords negative or presumptive evidence that the presentation could not be ascertained, which together make fifty-seven cases. In twenty-one cases, the following presentations are recorded: in twelve the head, in three the hand, in two a hand and a foot, in one a foot, in one a hip, and in two the arms.

The foregoing remarks, and the above authenticated facts, are, I hope, amply sufficient to establish the proposition of the necessity of the Cæsarean section as a recognised obstetric operation. Although the subsequent observations do not relate to the necessity of the operation, yet I deem them so practi-

cally important that I have ventured to place them in this chapter.

In some cases of rupture of the uterus, the infant might be removed with more safety to the mother by an abdominal section, than by dragging it away either by the feet or by the crotchet. Trask's extensive statistics are very favourable to its adoption in some cases of this accident.

When a woman who is nearly at the full period of pregnancy dies, or if killed by accident, the obstetrician is, morally, socially, and professionally, bound to propose *post mortem* hysterotomy. Justice to the incarcerated (most likely living) infant demands an immediate decision, as too long delay would be hazardous to its life. It is, however, a well known fact, that the infant survives the death of its mother much longer than is usually supposed. In this empire, medical men are quite at liberty to exercise a free and conscientious judgment; they are not trammelled by theological dogmas, as they are in France and other countries.

CHAPTER II.

On the Statistics of the Cæsarean Section.

THE statistics of the results of the Cæsarean section, especially as concerns the mothers, are highly unfavourable. The general account stands as follows of the seventy-seven women whose cases are tabulated. Sixty-six, or 85.71 per cent., died; eleven, or 14.28 per cent., were saved.

The number of successful cases here mentioned is greater than is usually allowed to have taken place; and, therefore, this statement requires further explanation. They are registered as follows. Nos. 1, 12, 35, 36, 37, 49, 53, 57, 67, 68, and 71: of these. Nos. 1, 12, 36, 49, 53, 67, 68, and 71, perfectly and permanently recovered. Case No. 35—She also recovered; the wounds being nearly healed. She lived several weeks; but afterwards she died from epilepsy, to which malady she had been previously subject. Case No. 37—The woman recovered; and afterwards died from disease of the hip-joint.

There is, however, another case included in the deaths which ought, in my opinion, to be in some measure considered as one of recovery. She lived seven days; and so long as she was rationally treated, she went on favourably. But after the treatment had been injudiciously changed, she gradually grew worse and died.

The special statistics, or the results, of the cases in which I have been concerned are as follows. Of six women, four died, or 66.66 per cent.; and two were saved, or 33.33 per cent.

From the seventy-seven women, seventy-eight infants were extracted; one being a case of twins. Of which forty-six, or 55.97 per cent., were saved; and thirty-two, or 41.02 per cent., were dead. Nearly all these infants were dead before the operation, which might have been saved if it had been earlier performed.

The special statistics, or the number of deaths, in my practice stand thus. Of six infants extracted, three, or 50 per cent., were saved; and three, or 50 per cent., were dead. Two of this number were dead before the operation, one of which was putrid; the death of the other was doubtless chargeable to the operation, and was caused by a spasmodic seizure of its neck by the uterus during its extraction.

The risk to infants in Cæsarean births is not much greater than that which is contingent on natural labours, provided correct principles of practice are adopted.

If I dare venture to give an ideal comparative estimate, I should say, if it is supposed 1 per cent. be the mortality of natural labour, that consequent on the Cæsarean section may be stated as scarcely $1\frac{1}{2}$ per cent.

Original Communications.

REMARKS ON CERTAIN POINTS IN THE SURGERY OF CELSUS.

By H. LOWNDES, Esq., Liverpool.

[Read before the Liverpool Medical Society, Nov. 17, 1864.]

WHEN we look back over a space of eighteen hundred years to the Augustan era, we feel like a man who stands on a mountain-top, and who, looking over a vast valley full of little hills, sees afar off the top of another great mountain, and wonders whether it can be as high as that on which he stands.

We, "the heirs of all the ages in the foremost files of time", are apt to look with contempt on those who have preceded us in what we call the race; and yet, with all our vast material progress, we have much that may teach us not to be too proud-minded. May we not already be descending from our highest point towards a new series of dark ages, a new deep and long valley, bounded by some mighty mountain far off in futurity? To pursue the simile, in the art of poetry, we seem to have culminated in the two peaks of Shakespeare and of Milton, and can hardly hope to reach such heights again. In the art of painting, we can hardly hope again to see the days of Raphael and of Michael Angelo. In eloquence, that trio, Lord Chatham, Fox, and Burke, are unapproached in these latter times. Has our art of Medicine reached its culminating point too? Is Surgery declining since the days of Hunter, and Medicine since those of Sydenham? The reply is satisfactory; here we are indeed "the heirs of ages in the foremost files of time"; and although I fear our medical writers can make no pretensions to the chaste and classic style of Celsus, yet we may maintain that the height on which we stand is higher than that Augustan mountain separated from us by so many ages, and that we have not yet reached our greatest height. A well educated surgeon of the present day will have more resources than were possessed by John Hunter; and the physician of the present day, though he may not rival Sydenham in his elegant Latin—which, however, some say was not his own—will be, if not so brilliant, yet surely a less sanguinary practitioner.

After this prelude, which I hope will be excused, I shall proceed to show, from a few examples, how high the eminence on which surgery stood in the days of Celsus, and to compare its state, in some respects, with its present condition; while I may allude very briefly to that long and dreary interval to show how low the art has sometimes fallen.

Fractures. Celsus, in his general rules for the treatment of fractures, points out the necessity of bringing the broken ends into apposition at as early a period as possible by making proper extension and manipulation; but says that if this extension is not used at first, it must not be used at all until the swelling and inflammation have subsided. He directs

the limb, after it is set, to be wrapped up in linen cloths soaked in wine and oil, and applied spirally several folds one over the other, and over these a layer of linen covered with cerate. About the third day, as these become loose, they are to be re-applied, and the limb to be well fomented at the time; so, again, on the fifth. Either on the seventh or ninth day, the swelling having now subsided, if there be any displacement, it must be reduced; the limb is to be again swathed up, and to be secured with splints; and "the broadest and strongest splint should be applied to that side towards which the fracture inclines." The splints have straps applied round them, which are to be tightened every three days; but are only to exert pressure sufficient to keep the bones in their places.

In fractures of the leg or thigh, the limb is to be placed on a frame, with a foot-board to steady the foot.

In severe compound fractures, no extension is to be made until the wound is healing; but the limb is to be placed in the position that is least painful, and the wound to be dressed daily with oil and wine, and blood to be taken from the arm if there have not already been much hamorrhage. Compound fractures of the thigh, he says, where the bones have been greatly displaced, generally require amputation; those of the humerus less frequently. He says there is always shortening after fracture of the thigh.

Fractures that unite at an angle are to be broken again. In cases of ununited fractures, for this opprobrium of surgery is of ancient date, the limb is to be extended to excite fresh injury, "*ut aliquid laedatur*"; the ends of the bones are to be first separated and then allowed to rub together, "*ut coneurando exasperentur*", and that any intervening substance may be destroyed.

He gives judicious rules for the treatment of particular fractures, which my space will not allow me to enter upon.

Although the mode of treatment of fractures laid down by Celsus be careful and sound, yet in our day we are not obliged to recognise shortening as an inevitable result of fracture of the thigh; but while we appreciate the use of the long splint, and of starch and plaster of Paris bandages, we must remember how recent their introduction has been. The modern treatment of ununited fracture was both dangerous and ineffectual, until the method was devised of causing irritation in the ends of the bones by the introduction of ivory pegs into their substance; and we are indebted to a member of our Institution for another method, which, I trust, will be a still further improvement, by which the ends of the bones are securely joined together by the metallic drills that are to create the irritation necessary to the throwing out of bony matter.

Injuries of the Head. The remarks of Celsus on this subject are full of interest. He gives a description of a trephine exactly similar to that now in vogue, and gives careful directions for its use; but he uses it rather in cases where caries or necrosis of the skull exist to a limited extent, than in cases of fracture; and he only applies the trephine sufficiently deep to remove the diseased shell of bone, leaving the inner table.

In cases of fracture with depression, or in cases of caries requiring the removal of large portions of bone, he recommends a number of small holes to be made with a drill, and then to be united together with the chisel until the part to be removed is completely separated. After describing well the symptoms of fractures of the skull and their varieties, and after insisting on the importance of the use of the probe in their detection, he says that, in his time as in ours,

in every case of fracture or fissure of the bone, the older surgeons used at once to have recourse to their instruments with which they performed excision.

He (Celsus) recommends simple treatment, such as plasters soaked in vinegar, covered with wool steeped in the same substance, and the wound to be thus dressed daily up to the fifth day. Then, if the fever subside, or be but slight, if the appetite return and the patient sleep well, we are to persevere and apply healing ointment. But if during the first period of treatment, the fever becomes severe, the slumbers short and disturbed, the wound moist and unhealthy, with swelling of the glands of the neck, and if there are severe pains and an increasing distaste for food, "*tum demum ad manum scalpumque veniendum est.*" He points out that by excision we give vent to any fluid that may have collected under the fracture, and we remove any portion of the inner plate that may be pressing on the brain. He says, in depression, "*Ubi medium os desedit, eandem cerebri membranam urget; interdum etiam ex fracturâ quibusdam velut aculeis pungentibus.*"

In the later stage of his operation for the removal of bone, he recommends the use of a copper-plate to protect the membranes of the brain while the chisel is being used; but he does not describe anything that seems like our elevator for raising the depressed fragments.

It is indeed amazing that, after the varieties, the symptoms, and the treatment, of these injuries of the head, had been so clearly described by Celsus that we can find little to criticise, yet this knowledge, so valuable to the preservation of human life, should have faded from the earth; that in the long ages of war and strife that succeeded, the skilful surgeon was superseded by the wizard with his charm or amulet, or the wise woman, or the monk; that, in later times, when surgeons reappeared on the stage, they soon became infected with the *nimia diligentia medicinæ*, and adopted the practice that Celsus reprobates, of using the trephine in all cases of fracture, without waiting for symptoms.

Mr. Abernethy was one of the first English surgeons who took pains to discriminate between those fractures that required active treatment and those that were better without it; and, after quoting many cases, he said "there are, doubtless, some depressions of the skull that it would be absurd not to elevate by an immediate operation, for in them the pressure on the brain would of itself be productive of fatal consequences. The arguments which I have stated against the immediate performance of the operation, apply therefore, in my opinion, only to dubious cases; to those in which, perchance, upon the subsidence of the inflammatory symptoms, the pressure may be found not to be so great, but that it may be borne without detriment, though there is a risk that it may be detrimental." He points out that the wound made by the trephine is a vastly more serious lesion than many fractures of the skull are.

Sir Astley Cooper took the same view. Mr. Guthrie, the great army surgeon, was able to say in 1842, speaking of simple fractures: "They (our predecessors) believed the bone could not be fractured without an extravasation taking place beneath; and some took credit to themselves for placing wedges between the broken edges, in order to allow of the escape of the blood or matter which might be formed below it. That blood may be effused, and matter may be formed, is indisputable, even under the most active treatment; but that an operation by the trephine will anticipate and prevent these evils, cannot be conceded in the present state of our knowledge; and the rule of practice is at present decided that no such operation should be done until symptoms super-

vene distinctly announcing that inflammation, compression, or irritation of the brain, have taken place."

Thus we slowly recovered ground that had been lost for so many ages.

Varicose Veins. It is rather startling to find Celsus say that varices in the legs are easily removed. "Any vein" (he says) "that is troublesome is either to be destroyed by the cautery or to be cut out. If it is straight, or if transverse yet single, and if of moderate size, it is better to cauterise it; if it is crooked and doubled on itself, as it were, in circles, or when many veins are confused together, it is better to excise. In applying the cautery, the skin is to be divided and the vein exposed by the knife; then the vein is to be lightly pressed with a small blunt heated cautery, and care is to be taken that the lips of the wound are not burnt. Then the wound is to be dressed as an ordinary burn; and that appears to be with lily or other such leaves soaked in oil and wine. This is to be performed throughout the whole varix, at as many spots as necessary, leaving interspaces of four fingers' breadth."

In the cure by what he calls excision, but what seems to be at most removal of certain portions of the vein, he directs it to be exposed above at certain distances, and to be isolated from its attachment at these points; a blunt hook is then to be passed under it, by which it is drawn up, and then it is to be divided, or, as he rather seems to mean, the portions lifted up are to be cut out. The wound is to be brought together, and over this an agglutinating plaster is to be placed.

If this operation of dividing or excising the vein was so successful and so commonly performed as Celsus seems to say, its success must have been due to the careful manner in which the thorough division was secured, and to what seems a slight thing—the application of an agglutinating plaster. The effect of this would be to completely exclude the air, and exert sufficient pressure to keep the edges of the wound at rest.

In modern times, though Sir Edward Home made a trial of the ligature in the treatment of this complaint, and Sir Benjamin Brodie of the subcutaneous division of the vein, yet, in general, palliative measures alone have been used until the last few years. Now, several modes of cure are becoming very commonly used. Some use small issues, as recommended by Mayo and others. Mr. Erichsen passes a hare-lip pin under the vein, lays a piece of wax-bougie over it, and then applies the twisted suture round the pin and over the bougie. He says he has operated in between two and three hundred cases without any ill consequences. Mr. Henry Lee recommends another mode, which promises to be both safe and effectual. He passes two needles, an inch apart, under the vein; then, with a ligature over the ends of each separately, makes pressure sufficient to stop the circulation in the vein; then he divides the vein subcutaneously in the interspace. The simple subcutaneous division by Sir Benjamin Brodie was found dangerous; but I believe Mr. Lee's procedure, by sealing for a certain time the vein above and below the wound, will make the operation as safe and as effectual as possible; and it is worthy of remark, that it is founded on the same principles that seem to have led to the operation described by Celsus—namely, the necessity of dividing the vein, and the necessity of keeping the access of air from it.

Diseases of the Anus. The affections of the anus seem to have a peculiar charm for surgeons of the present day; and almost every year we have two or three new publications on the subject, that are, I have no doubt, equally interesting and valuable. It is refreshing, however, to find that Celsus compresses into less than two pages his directions for the opera-

tive treatment of external and internal piles and fissures of the anus, and yet leaves very little to be filled up by his voluminous successors.

Fissures—"scissa"—of the anus, when they have become indurated, are to be brought into view and excised, that a new surface may be left.

External piles—"condylomata"—are to be seized with a vulsella, and excised near their roots. In the case of internal piles, acrid purgatives are to be given, that the tumours may be extruded; then, if they be small, and their necks narrow, they are to be ligatured at their base with thread; and, if very large, a needle is to be passed through the base, and a ligature passed under the needle round the base. If the tumours are very numerous, they are not all to be tied at the same operation, lest so many tender cicatrices be left. The after-treatment includes fomentations and poultices.

In another section, he gives very good rules for the palliative treatment of these diseases.

The knife for the external, and the ligature for the internal pile, have not yet been superseded; but, I need hardly say, simple incision has taken the place of the more severe treatment Celsus indicates for the cure of fissures.

Wounds of the Intestines. In a wound of the abdomen, with protrusion of the bowels, Celsus teaches that the first thing to be considered is the state of the portion protruded; if it be livid or colourless, or black, and insensible to the touch, "*medicina omnis inanis est.*" If the small intestine be wounded, he thinks nothing can be done; if the large, it is to be stitched up. The man is now to be laid on his back, with his hips raised. If the wound in the abdomen be too small to admit readily of the return of the bowel, it is to be enlarged. The bowel then is to be returned—that portion first that was last extruded; then the patient is to be gently shaken, that the folds of intestine may fall into their proper places, and there repose. When these are all concealed, the omentum is to be considered; any black or dead parts to be cut off, and the sound parts to be returned. Then—and this is a point of very great interest—he says that the wound of the abdomen is to be sewn up; but that suture, either of the skin or of the "interior membrane," by itself, is insufficient; it must be of both. The deep threads are to be applied at first more closely than in ordinary wounds, because that part is so liable to motion, and so peculiarly subject to great inflammation. Two needles are to be threaded, and passed always from within outwards, and are to be used the one with the right hand, and the other with the left, and so alternately. So the interior membrane (meaning the peritoneum) is to be brought together, and then in like manner the skin. Then agglutinating applications are to be used; and the abdomen is to be gently bandaged. For the needles to be crossed in this way from hand to hand, keeping each hand actively employed, might puzzle the most ambidextrous; but we have here carefully described a mode of bringing together abdominal wounds that has been revived of late years by those who, with so much honour to themselves, have brought the operation of ovariotomy to so great perfection. Here, then, again we have a most useful procedure lying dormant through long ages of warfare, and only revived in our own day. In the Middle Ages, our ancestors were more eager to rip one another up, than skilful to heal the wound; and their leeches were content to apply their salves to the bloody swords.

That surgeons in the time of Celsus were very successful in healing abdominal wounds, we may infer from the fact that they did not scruple to operate for the radical cure of ventral hernia by removing a

large elliptical portion of integument and peritoneum, uniting the wound in the way just described.

Rhinoplastic Operations. These operations, which, in the perfection to which they are brought, constitute one of the triumphs of modern surgery, do not seem to have been practised on a large scale in the time of Celsus; but he gives directions for operating in cases of fissure or want of tissue from ulceration or injury about the nose, ears, and mouth; and his directions show that he understood the principles on which we now proceed. Speaking of an operation on the lip, he says new tissue is not to be created there, but is to be drawn from the neighbourhood. The mutilated portion is to be reduced to a square; from its interior angles—that is, from its lower angles, if the lower lip—transverse incisions are to be carried, extending completely through the tissue; then we are to bring these flaps together. If this cannot readily be done, we must further extend the two incisions in a direction curving towards the wound, dividing the skin only. The approximated edges and the transverse incisions are to be stitched up; while the lunated incisions are to be filled with lint, that they may granulate. In the operation for making a prepuce, when the glans penis was from any cause left bare, he recommends the skin at the neck of the glans to be brought over it, and there tied, leaving only space for the urine to escape; then the skin of the penis is to be divided by a circular incision near the pubes, taking care not to open the urethra or blood-vessels; the skin is then brought forward, and the denuded spaces filled with lint.

We can hardly understand how any one, *causâ decoris*, as Celsus puts it, would submit to this ingenious operation.

Fistulæ. Where there are fistulæ near the surface, that do not get well by injection, they are to be laid open, and any hard portion excised. If they extend deeply inwards, they are to be excised; if they communicate with a diseased rib, the diseased portion of the rib is to be removed by dividing the bone on either side of the fistulous opening. Abdominal fistulæ may be excised, if small; but not if so large that the wound in the peritoneum made in their removal could not be readily sewn up. *Fistulæ in ano* he prefers to treat with a seton of twisted threads, applied tight enough to make gentle pressure on the part it includes. It is to be moved about twice a day, and changed every third day. The patient pursues his ordinary avocations, and the part external to the fistula is gradually cut through. When the knife is used, he recommends two incisions to be made, so that a small slice of the integument may be removed, and a kind of pledget inserted, that the edges may not immediately cohere.

The Treatment of Wounds with great Hemorrhage. I shall conclude this part of my paper with a very curious extract from the directions given by Celsus for stopping hemorrhage from a wound. In cases where we have reason to fear an excessive flow of blood, he would first fill the wound with dry lint, and make pressure on that with a sponge wrung out of cold water. If that do not suffice, he uses lint soaked in vinegar. If that and remedies of a styptic nature fail, then we are to seize and tie the bleeding vessel above and below the point at which it is wounded, and divide it in the interspace, that the ends may retract, and yet may have their mouths closed.

This passage is so curious, that I ought to give it in the original, from the section entitled “*Curatio adversus profusionem sanguinis in vulncribus.*” “... Venæ, quæ sanguinem fundunt, apprehendendæ, circæque id, quod ictum est, duobus locis deligandæ intercedendæque sunt, ut et in se ipsæ coeant, et nihilo-

minus ora præclusa habeant.” Where this cannot be done, the actual cautery must be used.

This tying the vessel above and below the bleeding point was what Guthrie so strongly insisted upon; and it is curious that a knowledge of its efficacy did not lead to the use of the ligature by the ancients in amputations.

I have now brought briefly under your notice several points in the writings of Celsus that seem to me of great interest when we compare them with the surgery of the present day. No doubt a careful study of the works of Hippocrates and Galen would bring to light many more such points of interest.

I need not say in how many departments of surgery we have now, mainly through the more accurate knowledge of anatomy, left the ancients in the shade. It is enough to allude to the perfection to which herniotomy, lithotomy, and lithotripsy are brought; to ovariectomy; to subcutaneous operations; to the use of the ligature, and, I hope I may add, of acupressure in amputations; to the resections of joints; and to the different modes of curing aneurism.

It may be that there is no one point in surgery in which we can now gain a step in advance by consulting the ancient records of the art; but this is no reason that those records should be consigned to oblivion. In the words of Celsus himself, while we take care not to defraud those of the present day of the credit due to their discoveries or improvements, yet, when they have simply copied from the ancients, let them give the credit to the original authors.

I said I would refer briefly to the interval between the decay of medicine that followed the Augustan era and its revival, with the general revival of learning.

We are told that surgery rapidly retrograded after the time of Celsus, though there was a little revival among the Arabians in the days when the Moslems overran the world. Then the monks became the surgeons, and how the art prospered in their hands may be gathered from the fact that at length it was found necessary to issue a Papal Bull forbidding the clergy to shed blood, and they handed the lancet and the scalpel to the barbers who used to shave their heads; but as physicians, in the more hidden paths of medicine, the monks continued to practise with less scandal, and perhaps with not less effect. Passing to later days, I will make one or two references to some of our early English works on surgery. One Peter Lowe dedicated at his own house in Glasgow, in 1612, a *Discourse of the whole Art of Chyrurgery* to James Hamilton, Earl of Abercorn, trusting that “his lordship would accept in good part (even as Minerva harboureth her owl under the target, Cithæra the deformed Cyclops in her lovely bosom, and Apollo the night raven under the heavenly lute) his painful travels.” This book begins with a dialogue on the nature apparently of things in general, but its surgical teaching contains much that is good, and the author’s continual marginal references to the ancient writers show how much the author has availed himself of them. His book is written in black letter, but it is ages in advance of another and rather older black letter book to which I will soon refer; but first I will draw your attention to a translation published in 1685 of the works of John Mays, doctor of physic in Arnheim. He is very much troubled about the acid and corrosive nature of things. I will make two short quotations from his book, which is very cheerfully written; and first of an “ambustion.” “A man, 30 years of age, setting fire to gunpowder, burnt his whole face and both his hands, whence presently arose redness and exceeding pain; to assuage which the patient applied ink, which was, as it happened, ready at hand. Had you seen the patient in this

state, you would have affirmed you saw the devil, unless you could (with the Ethiopians) persuade yourself the devil is white; which opinion Sir Thomas Brown . . . seems to favour, contrary to the testimony of the holy scripture, which saith 'the dwelling of Satan is a lake of fire burning with brimstone'; but the smoke of brimstone burnt, as our above recited author philosophiseth, is known by frequent experience to whiten woollen garments, as stockings and other things; and hence he concludes, that whatsoever is found in hell must needs be white." The author goes on to say how he applied to the burn "onions with honey, that (with their abounding volatile salt) they might open the constringed and stopped pores of the cuticle, temperate the acid humors, and restore to them their usual circulation."

He also relates a case of "very great torment of the abdomen." "A maid, aged 40 years, had now for six weeks past complained of a most vehement dolor, yet not far extended, but exercising its tyranny in a very small part of the belly, and day and night most cruelly tormenting the patient, who had used very many remedies, both internal and external. She was purged and had a vein opened, but in vain; so that (after the use of these) she almost despaired of recovering her pristine sanity; in the meanwhile the external cutis in this pained part could not be distinguished from the sound parts of the belly. I being called, with my knife cut a small wound, which is vulgarly called an issue, and kept that open by a pea put in and daily renewed."

"The next day after the cutting that issue, the patient had ease of her pain, which from day to day did more and more lessen, so that it was wholly removed quickly after. . . . Some acido-corrosive particles in the affected part, were perhaps separated from the other particles of the sanguiferous mass with which so long as they lay involved they could not exercise their sharpness. . . . These acido-corrosive particles freed from their cells in which they before lay included and collected in a very small part of the abdomen, did with their sharpness in a wonderful manner, continually agitate the fibrils, and so inferred that almost intolerable torment which must necessarily cease when these corrosive particles were driven out with the pus through the issue."

But that we may sup full of absurdities we must turn to the old book I referred to before, published in 1590, and containing a translation of the *Secretes of the Reverende Master Alexis of Piemont*. The following is one of his remedies for the pleurisy. "Take a tooth of a wild boar, and if the pain hold him in the right side, ye must take the tooth of the right jaw; if otherwise, ye must take the left tooth; yet notwithstanding it hath been found by experience to be all one of which jaw so-ever it were." The scrapings of this are to be given with a little barley-water. "This hath always been found very good and true."

For a bad leg you are to "take the skin of a dog if you may get it, or if not a white lamb's, or the skin of a kid, and cut a piece of it as broad as the palm of your hand." This is to be smeared with an ointment composed of pine resin, galbanum, mastics, musk, amber, and civet, and applied.

The following is against the "disease or grief of the flanks and the colyke passyon, experimented and proved diverse times." "Take the dung of a black ass if you can get it, if not let it be of a white ass; and the dung must be fresh and new, the which you shall seethe and boil in white wine, putting to it a handful of annis, a little oil of chamomile, a little oil of capers, with a handful of bran." These are to be boiled for the space of a "miserere," and administered as an enema. Mice-dung is his remedy for

spitting of blood, swallows baked and powdered and mixed with honey for the squinancie or quinsie. Perhaps I cannot conclude my paper better than with the following "very good and present remedy for to heal the pestilence, in drawing out the venom from the botch or sore or other like accident." "Take a quick hen, and pluck the feathers from her a—" (the word here used has gone out of fashion), "and from the place whereat she layeth her eggs, and set her so that the said place may be upon the grief, and that she may sit upon the botch or sore, or the place of the plague, and hold her so a good while. Then you shall see that the said hen shall have drawn out all (or at least some) of the poison and infection, and that shortly after she will die. It shall be good to do this with two or three or more hens, immediately one after the other, the which will draw all the venom out of the sore."

This is not from the works of a Swift, lashing with almost obscene satire the weaknesses of the learned of his day, nor is it from the works of some obscure quack, but is the solemn teaching of a most famous doctor of Padua, which was then the most famous school of medicine. The work had been already translated into French and Dutch, and was dedicated to the Duke of Savoy, a noble prince, to whom, as the translator William Ward, says, "trifles or fables are not to be presented, not being a man under whose name or protection lies or vain inventions ought to be set forth." So here we have a lively picture of the sad estate of our art towards the close of the middle and indeed dark ages.

FAMILIAR PAPERS ON CHLOROFORM.

By THOMAS SKINNER, M.D., Liverpool.

I.—THE VALUE AND FRUITS OF "GOOD WORDS."

I PRESUME that there are very few of us unacquainted with the popular monthly serial called *Good Words*. I also presume that, however short of the mark the work may be to the expectations and attainments of some, we must nevertheless give the work and its distinguished editor all credit for the very best intentions, and wish *Good Words* God-speed, but not without some passing criticism.

About a year ago, a tale was published in *Good Words* called "Oswald Cray," written by the popular authoress of East Lynne, Mrs. Henry Wood. In the number for March 1864, there is introduced a long sensation article on pain where no pain exists, but where some surgical operation is to be performed. The gist of the tale, having reference to chloroform, is as follows. One of the leading characters, Lady Oswald, meets with a railway accident, regarding the nature of which, the reader is left in total darkness. Her medical men meet in consultation over her case; namely, a Dr. Davenal and Mr. Mark Cray. They conclude that some surgical procedure is necessary, but they differ as to the necessity of inducing anæsthesia by chloroform. It so happened that Lady Oswald preferred Mr. Cray to Dr. Davenal as the operator on the occasion, and when Dr. Davenal was assisting or rather carrying the nurse (who had fainted) out of the room, Mr. Cray on his own responsibility put Lady Oswald under chloroform. Dr. Davenal returns; the operation, whatever it was, is performed successfully; but the patient never rallies, and within "one poor hour" Lady Oswald is dead. The interval between the dangerous symptoms and actual death is pretty considerable; but it is well filled up by some very nonsensical talk between the doctors.

A more unlikely scene it is hardly possible to conceive; in fact, it is only necessary to place the facts before professional men, and they cannot but condemn the whole narrative as *sensational* in the extreme, and contrary to medical custom and etiquette in all civilised nations.

I fancy I hear the reader exclaim *cui bono*? Why allude to such nonsense? I reply, simply because *Good Words* is a most popular and influential magazine; it is extensively read, and to a very great extent it moulds the popular opinions of the day on a great variety of subjects—chloroform not excepted. It behoves us then to look alive and counteract this morbid influence, by each of us in his own sphere informing his friends and patients, as opportunity offers, that the whole tale told in it about chloroform is downright nonsense!

Will it be believed, that I have been informed in more quarters than one that *Good Words* is pledged to allow nothing into its pages that favours chloroform? I trust, for the sake of its excellent editor, that this report is false. In a conversation which I had with Professor Simpson the other day while in Edinburgh, we came upon the subject of the *chloroform sensation scene* in *Good Words*; and he said he had a good mind to ask Dr. Macleod to give him permission to write an article on chloroform for his magazine. If Dr. Simpson does so, we shall soon know "which way the wind blows."

Now for the "fruits of *Good Words*." I was lately consulted by a lady who had been suffering from *fistula in ano* for eight years or more. On being informed of the nature of the case, and that there was nothing for it but a cutting operation, she trembled all over; but I found that the trembling was not caused by the thoughts of the operation; it was at the thoughts of having to take chloroform, from the effects of which, like "Lady Oswald," she might never recover. On making further inquiry as to the origin of her fears, she told me that she had "read a tale called 'Oswald Cray' in *Good Words*;" that the very name of the work and of the editor were sufficient guarantees of the truth, or at least of the correctness of the story; and that it had so deeply impressed her of the dangers of taking chloroform, *particularly from those who boasted of having great confidence in the agent*, that she would rather postpone the operation until she could make up her mind." After a lapse of six weeks, and by dint of occasional reasoning with her and her friends, I prevailed on her at last to consent to be operated upon under chloroform. On January 10th last, I put her under chloroform and incised the fistula, without the assistance of any one but her nurse (my patient objecting to the presence of a stranger). The patient made a rapid and most satisfactory recovery, and is now as great an advocate for chloroform as she was previously the reverse.

Add to the above the following scene, also the fruits of *Good Words*. Shortly before I entered the house of my patient, her clergyman, a believer in *Good Words*, made his exit; and, immediately before inhaling the dreaded chloroform, she begged that her step-child might be brought to her bedside, "that she might kiss her, probably for the last time." I do not make these remarks in derision of the beautiful motives which dictated the actions, but merely to show the state of mind produced in my patient by the perusal of that nonsensical and far fetched scene described in *Good Words*.

I have only to add, that centuries may elapse before *Good Words* produces as much real temporal good to humanity, as chloroform has already accomplished in sixteen or seventeen years.

ILLUSTRATIONS OF THE DIFFERENT FORMS OF INSANITY.

By W. H. O. SANKEY, M.D. Lond., Proprietor of Sandywell Park Private Asylum; Lecturer on Mental Disease in University College, London; late Medical Superintendent of the Female Department, Hanwell Asylum.

[Continued from page 137.]

THE next illustrations will be of cases of General Paresis. This term has been proposed in the place of "general paralysis", to which there is this fundamental objection, that, in the ordinary acceptance of that term, such a state would be equivalent to death. To avoid this absurdity, it was proposed to insert the word "incomplete". The name then becomes long, and is still inexact; and, moreover, does not separate those diseases with from those without insanity.

By "general paresis of the insane" is meant a peculiar form of mental disease, very common in asylums, having peculiar and well marked characters, and attended with mental unsoundness. And it must be distinguished from a general paralysis met with from spinal disease, and from the state produced by spirit-poisoning or alcoholism.

The scope of these papers does not admit of a discussion on abstract questions of pathology. It may be, however, stated that the French specialists consider that general paresis is a peculiar form or a distinct species of cerebral disease. To this opinion my own experience also leads; though I consider that those writers who view the paralysis as a mere epiphenomenon engrafted upon a case of insanity, or a mere complication or mode of termination of the disease, form a large majority of pathologists generally. I consider one cause of this difference of opinion to arise in a want of clear definition of the cases which are included in the term. There are examples of motor paralysis, undoubtedly, as from spinal disease, or even from cerebral disease, in various kinds of cases of insanity; and these are, as it were, accidents, not attributes, of this affection; and such accidents occur as one of the sequels of cerebral mischief, resulting from disorganisation of the nervous tissues. Such paralysis occurs in the asylums in all forms; as local—circumscribed; as hemiplegia, or paraplegia. Necessarily, these grave complications occur towards the end of the disease; for they contribute to the termination of life. But they occur also after various periods of the attack—sometimes in cases of very long standing, and in conjunction with various other symptoms, as in epileptic mania, in melancholy, or mania; or when the patient has passed into a state of dementia.

The disease meant by the writers on general paresis is different. It has its peculiar mode of attack, its peculiar progress and duration. The phenomena occur in a given order; though of course, as in all disease, the individual cases present certain variations.

The following cases are selected as typical examples of general paresis.

The first case is condensed from the reports, which extend over a period of two years and five months, with comments interspersed. The duration of this case is a fair average of the disease.

E. E. was admitted on November 17th, 1859, during my absence from the asylum. The history was gathered from her husband by my assistant. She was 33 years of age, married; the wife of a policeman; of plain education. She never had any children. The present was the first attack. There was

no hereditary tendency to insanity. She had always been temperate.

About four weeks prior to admission, she began to covet articles of luxury beyond her station; as dress and finery. She expressed a wish to ride in a carriage and six horses, and live in the pomp and splendour of a queen. She talked very largely; was restless and troublesome; excited, hasty, and altered in behaviour. She attempted to escape out of the house.

At the end of the week after admission, her case was reported to the commissioners thus: "Is labouring under acute mania, with exalted ideas; is noisy, garrulous, and destructive."

It may be here pointed out that my assistant, who had had some experience in the disease, makes no allusion to any previous melancholic stage. I take this to be pretty conclusive that none existed; for, though the notes are not by me, they came under my observation; and my attention had already been strongly directed to the first symptoms of general paresis. The notes at first are few and brief, owing to the work imposed by my own absence; but the patient's mental state is pretty clearly indicated by the terms used—"Is labouring under acute mania"—which is only in accordance with received views, that mania may terminate in paresis.

She continued in an excited and maniacal condition; being reported to be, at different times, noisy and destructive to her clothes, from admission up to December 17th, or for one month. Her violence caused her to be placed in seclusion for three hours on November 25th; three hours on the 26th; four hours on the 28th; for two hours on the 29th; for four hours on Dec. 1st; for two hours on Dec. 2nd; for one hour on the 7th; for two hours on the 11th; for one hour on the 12th; and on the 17th, it was reported that she had become quieter, and had requested to go to the laundry to work. She continued to work at the laundry industriously. On January 10th, she had a slight accession of excitement, which was allayed by an opiate. On January 23rd, it is reported: "Is now at work in the laundry; but is subject to occasional outbreaks of excitement, lasting only a short time; and manifesting only a little self-will and perversity of temper." She continued to progress favourably, and became quiet and rational, and, to an inexperienced eye, convalescent.

On April 20th, she was visited by her husband, who said "that he had been conversing with his wife for some time, and had found her perfectly sane and rational. He had never seen her so well in his life." This is quite what is usual; and very frequently the relatives set up their judgments against the medical adviser, and remove the patient from treatment. Many cases are thus lost sight of; and the patient is frequently kept at home for periods varying from months to one or two years; and not unfrequently, on readmission, are reported as cases of a second attack. A fallacy is thus introduced—that the primary attack may be mania, and that general paresis occurs in second attacks. I have pointed this out elsewhere (*Journal of Mental Science*, No. 48, Jan. 1864), where I have also shown that, out of sixty-one cases treated by me, not one occurred in a genuine second attack of insanity; but that five cases had been reported to be cases of second attack, which proved only to be cases in which a remission of the symptoms had taken place. I am disposed to believe that such remission of maniacal symptoms occurs generally in that proportion, or in five out of sixty-one cases.

The various modes in which the remission occurs have been studied especially by M. le Dr. Sauze (*Ann. Médico-Psychol.*, Oct. 1858).

Whether the symptoms ever are actually absent

in these reported remissions may be a matter of doubt. In the present case, the husband, who may represent the public, could detect no disease or change. This patient was examined specially by one or two medical friends, who pronounced her convalescent. To my eye, however, certain indications of the disease were evident; but I failed to convince or demonstrate their existence to the professional friends.

The symptoms or signs present at this period consisted in a peculiar facial expression. As the diagnosis at this stage is important, it may be here described. At first, the peculiarity is but slightly marked; but is of the same kind as when the disease is more advanced. The face then becomes an expressionless mask; the facial muscles partake all equally of the imperfect action; and the delicate lines and folds into which the facial muscles throw the integuments of the face, under the influence of the various emotions of the mind, are lost, or are formed clumsily and imperfectly. When the muscles act, the face is contorted; and when they are at rest, it is void of all expression. The cheeks are flabby and sleek; the mouth is straight; the levatores palpebrarum slightly let fall the eyelids, while the brow is raised or arched; and these two actions, which do not harmonise in health, give a special expression to the face—an expression, however, which is seen in drunkenness. Indeed, since drunkenness affects the muscles generally by impairing their action, many of the symptoms of the one state resemble those of the other.

It was a slight indication of this peculiar expression, coupled with the exalted notions at the commencement of the attack, that directed me to an unfavourable diagnosis.

Nov. 21st, 1860. General paresis, which had been gradually increasing for some time, was now very marked.

Aug. 19th, 1861. She was in good bodily condition, but feeble health. She took her food well, eating more than others. Catamenia regular. She was very tottering in her gait, and with difficulty went up and down stairs. She was often confused in her articulation, and indistinct; was slightly peevish, and would occasionally strike.

September. Articulation was more indistinct, stammering, and tremulous. She worked regularly at her needle, but performed her work rather more coarsely, and was slower.

Oct. 8th. The conjunctivæ were injected; pupils equal.

Nov. 1st. The mind was becoming more feeble; the voice more tremulous; pupils equal. The tongue was protruded without difficulty.

December. She was removed to the infirmary, on account of the increasing paralytic symptoms. She had been gradually becoming more feeble and tottering in her gait, and more imbecile in mind. Articulation was less distinct. The tongue was free from tremor. The right pupil was a shade larger than the left. Her expression was dull and without animation. The eyebrows were slightly elevated. She had a difficulty in pronouncing the letter "r" in rural; much contortion was produced in attempting it at the angles of the mouth and chin. The mind was very feeble. She could not say whether it was winter or summer.

Jan. 14th, 1862. Paresis and dementia were increasing. Paretic symptoms were worse in the morning. She gained strength as the day advanced. There was no difference of muscular power between the right and the left side.

Jan. 23rd. She was now very feeble, but had not lost flesh; sat with the head hung down; and rested

with her elbows on the chair, in an attitude of great prostration. On her attempting to move, considerable muscular agitation and trembling took place. The features were relaxed, heavy, and expressionless; the pupils were equal; the conjunctivæ were injected, and discharging thick mucus. She took little notice of what was passing. When she looked up, the eyelids drooped. The brow was arched. In speaking, the voice trembled; and there was considerable twitching of the lips and chin. She said she was "very well and very happy". Her appetite was good.

Feb. 3rd. She took to bed, being unable at last to stand. Pulse 72; no emaciation.

Feb. 6th. She began to play with the bedclothes. Dementia was increasing; sensation was generally appearing dull. She did not evince the least pain when pinched; tickling the soles of the feet produced only slight movement. (This last has been proposed as a diagnostic sign between spinal and cerebral disease; but the evidence appears to be equivocal.)

Feb. 19th. There was slight improvement in strength and mind; and variation in the state of the pupils.

March 3rd. Both pupils were dilated, and slightly irregular in contour.

April 11th. The mind continued to be slightly improved. Her general powers were failing. The pupils varied. Breathing was quick, with slight rhonchus. At intervals she gathered up the bedclothes.

April 12th. She died.

NOTES ON HERNIA.

By JOHN THOMPSON, M.D., F.R.C.S., Bideford.

[Continued from page 546 of last volume.]

BEFORE applying the taxis, every surgeon endeavours to assure himself of the species of rupture which is the subject of strangulation, and the precise course the protrusion has taken. A hint may not be out of place that, to carry out this intention the more effectively, it is well to use the sense of sight as well as that of touch. Herniæ of different species sometimes resemble each other very closely; and a femoral, tilted by the superficial epigastric vessels over and above Poupart's ligament, may, especially in a female, be confounded with an inguinal, and so the taxis be applied with disastrous effect.

I have, in more than one instance, seen a first and erroneous impression conveyed by the touch, corrected, when, by the eye, the position of the tumour has been examined in relation to the processes of the ilium and os pubis, and the course of the connecting ligament. In the case of ladies, a surgeon often feels some hesitation in proposing an examination by the sight; but where so serious a disease exists, delicacy of feeling must give way to considerations affecting the welfare of the patient and the reputation of the surgeon.

As aids to the taxis, I have used, in almost every case where required, the warm bath, and esteem it beyond all other remedies. I have sometimes bled with benefit; and in two cases had the patients suspended by the legs, in the manner described by Mr. Griffin, but the latter was without advantage. I have never used suflation; but have tried the injection of cold water for the distension of the bowel, much on the same principle that injected air is supposed to act, but without success. I have little experience of chloroform. Topical applications of cold water have never seemed to me of any avail in femoral; but I have, in two or three cases, known

them succeed in old inguinal herniæ, where continued for a long time, the patient being at the same time laid in a favourable position in bed.

The taxis, as used by the surgeons with whom I have acted, as well as by myself, has never resulted in any harm; where unsuccessful, no prejudice has been done to the cutting operation; and where reduction has been accomplished, the health of the patient has promptly returned, unless, by the long continuance of the strangulation, peritonitis had previously come on, and then recovery was not so speedy.

A curious case once occurred in my practice, in a man who was a bootmaker and small farmer. He was the subject of inguinal hernia, which became strangulated, and he sent for me. I was unable at first to reduce it, and had to employ bleeding to faintness, when I completely succeeded. The man felt immediate relief and restoration. After due tarry with the patient, I left. Next day he prudently remained in bed; but having a good appetite, and knowing that some fresh pork had been obtained for the household, he requested to have some steaks for dinner, which were accordingly cooked and brought to him. He ate freely and with relish, and proposed to have some sleep after. In the course of some hours, as the bedroom seemed very quiet, the wife went upstairs to see how her husband was, and, to her astonishment, she found him quite dead. I got no *post mortem* examination in the case; but if I had, my attention would have been directed to the head rather than the abdomen, as the man had suffered some while before from ocular spectra and illusions, dependent, as the event seemed to show, on disease within the encephalon, which, at this particular juncture had resulted in death; the family, however, connected the hernia more closely with the result, and talking people intimated that the doctor probably did not thoroughly understand the complaint he treated.

Obstruction in old irreducible herniæ occasionally occurs, attended with symptoms resembling those of strangulation, although no additional protrusion has taken place. Several symptoms have been laid down as diagnostic in this condition; and Mr. Erichsen has remarked that, "where obstruction occurs in an old irreducible hernia, vomiting is not feculent." I, however, met with a case where vomiting much resembled that in truly strangulated hernia; and yet no new protrusion had taken place, the mischief having arisen from morbid action set up in an old adherent rupture, the condition of which was verified by an operation.

Sometimes a new protrusion exists with an old irreducible hernia, the strangulation of which is a condition co-existent with inflammation of the old rupture; in which case, reduction of the strangulated portion may not be attended with complete relief, because the disease in the other portion is not removed at the same time. I have known two cases lately, where the administration of a brisk purgative was attended with complete relief, at the same time that it assured the surgeon of the reduction of the strangulated portion having been effected. It is necessary to use much tact in these instances; for a purgative may otherwise be administered whilst strangulation exists—an undesirable practice, but still one that may occur without a practitioner being fairly chargeable with blame.

In a case of strangulated enterocele in connection with irreducible epiplocele, which came under my advice within the last month, the taxis so much reduced the size of the hernia, that the patient supposed it no larger than usual; and as the symptoms of obstruction were mild, the surgeon hoped they might depend on the morbid action excited in the

old hernia, and he ventured on purgatives, but as reduction of the fresh rupture had not truly been effected, the plan was of course abortive. When I saw the patient, the vomiting was decidedly feculent; and this, taken in conjunction with the other symptoms, determined the advice for an immediate operation. As the case was anomalous, the sac was opened before division of the stricture, and found to contain firmly adherent omentum, almost enveloping a small intestinal protrusion.

Strangulation had here existed for six days, and the parts were discoloured and in bad condition. Death occurred in another six days from peritonitis (verified by a *post mortem* examination), although the operation bade fair to be successful for the first four days.

[To be continued.]

A SUGGESTION FOR THE TREATMENT OF OVARIAN TUMOURS, BY COMPRESSION AND OBLITERATION OF THE TUMOUR AT ITS BASE OR PEDICLE.

By BENJAMIN W. RICHARDSON, M.A., M.D., Senior Physician to the Royal Infirmary for Diseases of the Chest.

ON rising from the perusal of Mr. Spencer Wells's remarkable work on *Diseases of the Ovaries*, a suggestion has occurred to me, in regard to the treatment of ovarian tumours, which is, I believe, new, and which, if successful, would simplify the present operation to an extent that none, except those who have seen the operation performed, can understand.

My suggestion is simply to operate, so as to compress and obliterate the tumour at its base or pedicle, either by ligature or acupressure, and thus to cut off its vascular connection with the body; then to evacuate the fluid in the cyst, as far as is possible, by the trocar; and, lastly, to leave the cyst in the body to undergo natural shrinking and absorption.

The suggestion is based on the consideration, that an ovarian tumour is, after all, virtually an enormous aneurism. True, it is filled only with the water of blood, a little albumen, and a little saline matter; but all the fluid is derived from blood; and when death occurs, it is as from slow hæmorrhage. To cut off, therefore, the blood-supply from the tumour, would be to prevent the secretion of new fluid, and to stop the nutrition of the sac altogether.

From the comparative ease with which the ovariotomist turns out the sac, when the abdominal walls are laid open, I cannot assume that the cyst derives any important blood-supply, except from its base; from the point, that is to say, where it originally was developed. If this be the anatomical fact, it follows that the nutrition of the cyst can be commanded at the base; and that to tie or otherwise compress the cyst there, and cut off all vascular communication from it, is simply equivalent to the performance of Hunter's operation on the femoral artery for the treatment of aneurism in the popliteal space, and is the same as removing the cyst itself.

The details of the operation, subject to modification, would be the following.

1. The patient being under chloroform, a trocar should be passed into the cyst: the trocar should be so constructed, that, without the necessity of removing it, the current from the tumour could be stopped at any moment, as the operator should direct.

2. When the body is relaxed to a proper extent by the withdrawal of fluid, a small incision should be made over the base of the tumour, and the parts dis-

sected down until the tumour is reached. An incision such as is made for tying the common iliac artery would probably suffice.

3. The tumour reached, the operator would isolate its neck as low as possible, with the finger, and would then cast two strong ligatures, an inch apart, round the neck, with a large aneurismal needle. He might now entirely evacuate the tumour of its fluid contents, through the trocar, and then tie his ligatures; or he might tie the first, and draw off the fluid afterwards.

4. The ligatures, cut off close, might be let remain in the abdomen; and, the wound being closed and pressure being applied to the abdomen, the cyst, I think, might be left without danger.

I have here suggested the compression of the neck of the cyst by a ligature, to apply which requires an incision. But in so doing, I only insist on the act of compression, not necessarily on the incision. I see indeed, if the principle be correct, that the details may be much simplified. It would not be difficult—for example—to pass through a very small incision, a long acupressure needle behind the tumour, and by a figure of eight twist round the extremities of the needle outside the abdomen, to bring the neck of the cyst fairly up to the abdominal wall and secure its compression.

Or it might be possible to obliterate, subcutaneously, by means of a needle and thread only; I mean by passing a long curved blunt-pointed needle armed with a strong thread, and introduced into the abdominal cavity by a subcutaneous incision, clean round the tumour at its base, and by tying the thread, after the needle was withdrawn, in a firm slip noose that should grasp the pedicle of the cyst with the required force for compression.

Again, a clamp might be invented to open round the neck of the cyst, like the blades of a lithotrite, and to close by a screw movement upon the neck, and destroy the vascular connection.

If the principle thus suggested be sound, it will admit of application in all cases of ovarian tumours demanding operation. But it has the advantage of being applicable in cases where the present operation is impossible; I mean in cases of multilocular cyst, or where the cyst is fixed too firmly by adhesions. It might be best to try the operation by compression in one of these cases first; in a case where, the present operation being hopeless, the patient must die, unless some other operation be at hand to save.

12, Hinde Street, February 27th, 1865.

THE FRENCH ACADEMY OF SCIENCES has offered for 1866 a prize of 20,000 *francs* for the best essay on the question: The Preservation of Limbs by Preservation of the Periosteum.—The academy has awarded the Lalande medal, the highest astronomical prize in the gift of the academy, to Mr. Richard Carrington, of Redhill, the indefatigable observer of solar spots.

MÜTTER LECTURESHIP ON SURGICAL PATHOLOGY. The late Dr. Thomas D. Mutter left to the College of Physicians of Philadelphia the sum of \$30,000, and his extensive collection illustrative of surgery and surgical pathology. The conditions having been complied with—the chief one being the erection of a fire-proof building within a specified time, adapted to the purpose of the College—it has come into possession of the thirty thousand dollars, the interest of which is to be expended in making additions to the museum, paying a curator, and sustaining a course of lectures on some department of surgery—the lecturer to be appointed annually by the College. The choice of the College of Physicians of a person to deliver the first course of lectures has fallen on Dr. John H. Packard, who has begun a course on surgical pathology.

BATH AND BRISTOL BRANCH.

LIP-TOURNIQUET.

By AUGUSTIN PRICHARD, Esq., Clifton.

[The following is a description of the lip-tourniquets shown by Mr. Prichard at the last meeting of the Bath and Bristol Branch of the British Medical Association.]

Each little instrument consists of a piece of hard and polished steel, bent like the letter U. To one arm is fixed an oval steel plate, seven-eighths of an inch long and half an inch wide, covered by a flat and firm cushion of vulcanised India-rubber. The other arm bears a similar plate, which is steadied by two steel rods, and moved by a fine central screw.

The wood-cut, which is of the exact size of the original, will make the account more intelligible.

Application. The first described arm is introduced within the angle of the mouth, and presses against the mucous membrane at any convenient spot; and then the moveable plate is screwed gently down until the cheek is pressed as firmly as may be advisable.

These little instruments have been tried in a case of cancer of the lip, where they answered very well. They would be useful in any operation about the lips, and especially in hare-lip.

The sets hitherto have been made by Messrs. Dell, No. 43, Broad Street, Bristol.

TRAITÉ THÉORIQUE ET PRATIQUE DES MALADIES DE L'OREILLE ET DES ORGANES DE L'AUDITION. Par le Docteur J. P. BONNAFONT, Médecin principal à l'Ecole impériale d'application d'Etat-major, etc. Avec 22 Figures intercalées dans le Texte. Pp. 665. Paris: 1860.

[A THEORETICAL AND PRACTICAL TREATISE ON DISEASES OF THE EAR AND OF THE ORGANS OF HEARING. By Dr. J. P. BONNAFONT. Paris: 1860.]

THE author of this work informs us that his attention has been directed to the study of the ear and its diseases during thirty years. In 1830, he carefully dissected the organ, and conceived the design of constructing an instrument for examining the external auditory canal; but this project was interrupted by his being employed in military service. M. BONNAFONT, however, has throughout continued, both in

military and in civil practice, his investigations on diseases of the ear; and hence, as he observes, the work which he has published is the result of long continued observation.

The book commences with an introduction, in which, after some remarks on the present state of aural pathology and therapeutics, the author takes into consideration the physiology of the ear, and gives especially a sketch of the various opinions held regarding the functions of the ossicles, the membrana tympani, and the muscles of the middle ear. The conclusions at which he has arrived are summed up by him as follows.

"1. The membrana tympani, in place of simple movements of general tension and relaxation, undergoes partial tensions and relaxations, under the influence of the petro-malleal and pyramido-stapeal muscles. 2. These two muscles constitute the only active powers of the movements of the tympanum and the chain of ossicles; and they are antagonists, as regards the portion of the membrane which they separately render tense. 3. This membrane may vibrate under the influence of sounds which strike it, but cannot transmit them to the deeper parts of the ear without undergoing degrees of tension and relaxation by the action of these muscles. 4. Although the soundness of the tympanic membrane is not absolutely necessary to hearing, its injury always produces an aberration in the perception of sounds. 5. In perforations of its anterior part, the ear is less accessible to grave sounds; while the contrary holds good for acute sounds when its posterior part is similarly injured. 6. The ossicles of the middle ear are not absolutely indispensable to the mechanism of hearing, provided always that the stapes only remain in place. 7. The fall of the stapes, by allowing the escape of the fluids contained in the vestibule and labyrinth, always induces deafness with a rapidity which is in bearing with that of the discharge of the fluid. (This conclusion entirely conforms with that which M. Flourens has deduced from his experiments on birds.) 8. In this case, if the ear has preserved a little hearing, it will indeed be sensible to the least noise, but it will have lost all power of receiving the simultaneous impression of several sounds. 9. The necessary conditions for a good musical ear should lie (apart from the intellect) in a perfect concord between the malleo-tympanic articulation on one side, and the membrane of the tympanum and its moving muscles on the other. 10. Examinations made on several distinguished singers have demonstrated that the membrane is disposed in them so as to receive the sounds equally and directly on its entire surface. 11. An oblique and very inclined direction of this membrane, with regard to the axis of the auditory canal, constitutes a vicious disposition, which, whilst weakening the hearing, renders the ear very ill adapted to certain sounds." (P. 30.)

In the twelve chapters of which the work consists, the author treats of the Diagnosis and Treatment of Diseases of the Ear; of the Diseases of the External Ear, Auditory Canal, Membrana Tympani, Eustachian Tube, Tympanum, and Auditory Nerves; of Deafness; of Ear Trumpets and other Acoustic Instruments; of the Deaf and Dumb; and, finally, he offers some Medico-legal Considerations on the Deaf and Blind.

In the fourth chapter, on Diseases of the Auditory Canal, the author has entered elaborately into the consideration of polypous and fungous tumours; to which, as he thinks, sufficient attention has not been paid. He treats of, 1, the position, character, and

form of polypi of the ear; 2, the symptoms which they produce; and 3, their treatment.

Polypi of the ear, he says, may arise from any part of the canal or of the membrana tympani; and are met with more frequently near or in the latter membrane than at the orifice of the canal. In structure they are analogous to nasal polypi, allowance being made for the difference in structure of the lining membranes of the ear and nose. They may be vascular, mucous, vesicular, or fibrous. Mucous or fibrous polypi, not connected with the tympanic membrane, are more easy to destroy completely than those which arise from the membrane or from the tympanum itself. Carcinomatous tumours cannot be removed in such a manner as to ensure their non-reproduction.

A polypus in the ear, having filled the canal, tends to grow in one of two directions; either outwards through the meatus, or inwards towards the tympanum. What it is that determines the direction taken in each case, is difficult to comprehend.

When a polypus arises from any part of the two external thirds of the canal, it generally produces merely symptoms denoting more or less obstruction; viz., more or less deafness; purulent discharge; and, when the polypus has attained such a size as to press on the walls of the canal, pains which are increased by the movements of mastication. The deafness in this case is merely symptomatic—the hearing is suspended, not destroyed.

On the other hand, when a polypus tends towards the tympanum, the results are much more severe. When its point reaches the membrane, the patient feels a vague pain, principally referred to the throat and the orifice of the Eustachian tube. The tympanum sometimes becomes habituated to the pressure, if it be always equal; hence the hearing undergoes various alternations, but at last becomes permanently affected in proportion to the size of the polypus and the amount of pressure which it exercises. If the tumour continue to grow in the direction of the tympanic cavity, it commonly produces severe pain at the base of the ear, increased by mastication, coughing, or deglutition. In such cases, a quantity of air is driven through the Eustachian tubes into the tympanic cavity, the membrane is pressed back against the polypus, and an increase of pain is produced, which radiates to the scalp and face on the same side. Without having much headache, the patient has dazzling of the eyes, vertigo, and sometimes vomiting. In the acute stage, the gait is also unsteady, as if the patient were intoxicated. These symptoms sometimes attain considerable intensity, but cease suddenly on the occurrence of a sanguineous discharge from the ear. The polypus then diminishes, and the patient may experience comparatively little inconvenience for months or even for years, until it again enlarges.

In the course of time, the polypus may become more hard and consistent, and less susceptible of great variation in size; and, the tympanic membrane and chorda tympani becoming apparently habituated to the pressure of the tumour, this ceases to produce any other symptom than more or less deafness. In such cases, if the polypus be carefully removed, the membrana tympani is found covered with a whitish layer and strongly pressed inwards. If the disease be not of sufficient standing for the membrane to have become adherent to the wall of the cavity or

the articulation of the malleus with the incus to have become ankylosed, attempts may be made to draw the membrane outwards by an instrument, or to drive it out by blowing of air through the Eustachian tube. When these means fail, M. Bonnafont makes a small opening in the membrane, and introduces a curved blunt probe, by means of which he endeavours to detach the membrane from the walls of the tympanum. This plan, he says, almost always produces a notable improvement in hearing.

Sometimes the membrana tympani is perforated by the polypus; which then enters the tympanic cavity, and almost always destroys the ossicles. If the membrana tympani be not entirely destroyed, it forms a neck which strangulates the polypus, producing from time to time very severe pain.

In the treatment, M. Bonnafont approves of tearing away the polypus when it is attached to the walls of the auditory canal; but reserves excision or ligature for polypi attached to the membrana tympani. Of all these operations, he prefers excision; which, he says, can be performed on polypi seated in any part of the auditory canal. He describes at length the instruments which he uses, the mode of performing the operation, and the treatment which should follow.

M. Bonnafont notes, that it has been doubted by several modern aural surgeons, as Wilde, Tynbee, Triquet, Menière, and Deleau, whether hearing is restored after the removal of polypi from the ear. He believes, on the contrary, that, when the auditory nerve is not affected, the removal of a polypus will necessarily affect an almost immediate improvement in hearing; and he relates a case in support of this opinion.

In speaking of the Diseases of the Membrana Tympani, M. Bonnafont notices that Itard appears to have been astonished to find that perforation of the membrane sometimes, instead of producing deafness, only rendered the hearing more acute. He explains the difference of results in the following manner.

“As a general rule, when the hearing is very fine and delicate, and the tympanic membrane is in a normal state, any accidental perforation of necessity produces more or less considerable injury of hearing; while, when this faculty has been already diminished, either from thickening of the tympanic membrane, or from weakness of the muscles of the middle ear (provided that there be no organic lesion of the auditory apparatus or nerve), perforation of the tympanum produces an amelioration in proportion to the extent of the opening, provided that the chorda tympani nerve be not involved.”

There is much matter of interest and of practical value in this volume, which renders it worthy of a place along with the standard works of aural surgery which we possess. The author has done good service in placing before the profession the results at which he has arrived from a long experience; and those who are interested in aural surgery will find some useful hints in the volume. We must add, that Dr. Bonnafont shows a fair acquaintance with the writings, not only of the aural surgeons of the continent, but of Tynbee, Wilde, and others who in this country have specially studied the diseases of the ear.

WE beg to remind the members of the Association that the annual subscription is now due. Payment of the same can be made either to the Honorary Secretaries of Branches; or to the General Secretary, T. Watkin Williams, Esq., 13, Newhall Street, Birmingham.

British Medical Journal.

SATURDAY, MARCH 4TH, 1865.

POLICE REGULATION OF PROSTITUTION.

LAST year the House of Commons passed an Act which had for its object the superintendence by the police of prostitution in certain garrison towns of this country. A Committee on Venereal Diseases has since been appointed by the Government; and it is generally understood that its labours, if of any service at all, will be so by recommending some prophylactic method of dealing with the disease—in fact, that they will propose a system of registration of prostitutes, something after the manner practised in certain continental countries. This way of dealing with prostitution—of legalising it by bringing it under the management of the police—appears of late to have found great favour with many members of our profession; and we believe that there has been expressed a hope that this way of attempting to control prostitution and the spread of venereal diseases will not be limited to the districts where soldiers are collected together in large bodies, but will be generally adopted throughout the country.

For many obvious reasons, the indirect patronising of prostitution by the Government, by an Act of Parliament, has been generally regarded in this country as repulsive, in a certain sense, to the moral sentiments of the community. At all events, every one will admit that this feeling, even though it be a foolish prejudice, cannot be overlooked in considering the subject; and we, therefore, may fairly assume that those who propose such an unpleasant remedy, for the purpose of diminishing the spread of syphilitic disease, are bound distinctly to show that it has proved effectual where it has been properly tried. Those who wish the system of registration of prostitutes introduced into this country are influenced, we suppose, mainly by the consideration that thereby the spread of venereal diseases will be arrested. They can have no great admiration of such a system *per se*; and we suppose, therefore, accept it as the less of two great evils.

Now, whether Government, in publicly managing prostitution, does or does not do an evil thing for the sake of doing good; and whether it be or not, under certain circumstances, right to do evil in order

to get at a great good,—it is no business of ours here to inquire. But what we think the profession and the public have a fair right to ask of those who propose a legal recognition of prostitution is this, that they show clearly and satisfactorily that the system answers the purpose required of it, and produces the good which is asserted of it, in those countries where it is adopted and has been long in operation. Has this good ever been satisfactorily shown? We think not. It seems to have been taken for granted, without proper inquiry, that the system, where it is in operation, must have produced all the good predicated of it. But its admirers have not produced their proofs—have not come forward with their figures and facts to demonstrate that venereal diseases have been sensibly diminished, for example, in France, by the governmental regulation of prostitution. They have not shown that venereal diseases are less common in France than they are in England. They have not given grounds for the belief that venereal diseases are more common in London, for example (*pro ratâ*), than they are in Paris. It will hardly do, in such a case as this, to argue that the regulation of prostitution *must* diminish the spread of these diseases. They who patronise the system are surely bound to give good reason from facts to prove that it has done so where it has been in operation. Surely, if it has produced the wished-for effect, there should be no difficulty in establishing the fact.

We wish in no way to prejudice the case; but we simply ask of those who are desirous of introducing the system here, to demonstrate its utility elsewhere. In our opinion, it is hardly enough to show that in some small garrison towns, and under certain peculiar and rigid adoption of police and military regulations, venereal diseases have been diminished amongst a given body of soldiers. If the system is to be introduced generally into this country, we ought to have some good reason given us for the belief that venereal diseases are less common amongst the French community at large than they are amongst the English community at large. Now, we would appeal to any medical man who has studied medicine in Paris: Has he seen any signs in hospital practice, or has he been led by anything which he observed of the matter in Paris, to lead him to believe that such is actually the case? Have the remarks of his teachers there ever tended to bring him to such a conclusion? Has he not, we might ask, on the contrary, been struck by the universal and prominent manner in which the disease and its methods of cure are everywhere brought under his observation in Paris?

If we turn to French authorities on prostitution, we find no satisfaction. Duchâtelet himself declared that under the system, as carried out in France, venereal diseases were spread widely, and the "wise

measures of the Administration rendered all but useless"; and he explained the fact thus. He asserted that what he called "clandestine prostitution"—

"That which is exercised in secret, and unknown to the police, is of far greater importance than public prostitution. Through it, innocence is perverted and corrupted; it braves and paralyses authority, and propagates with impunity the most fearful contagion and the highest immorality." (Vol. i, p. 471.)

Duchâtelet tells us that where there is one registered prostitute, there are nine unregistered females who practise prostitution in Paris—i. e., whom the police cannot touch. Consequently, only one out of ten women who spread venereal diseases come under the hands of the police in Paris—there, where prostitution is actually under the surveillance of the law. And what was Duchâtelet's remedy for the evil? The only one he had was this; viz., to multiply in all directions the licensed houses of prostitution! Duchâtelet may have been wrong in his calculations; but those who say he is are bound to prove where his error lies.

Some time since, there were in Paris, an authority tells us, 4,206 registered prostitutes; and the number of "clandestine" prostitutes at the same time, who were not registered, were calculated at from 40,000 to 60,000. Of what avail, as Duchâtelet asked, was it to supervise the 4,000, while the 40,000 to the 60,000 escaped all supervision?

Again, one of the main reasons which have led to the proposal of introducing the system of supervision of prostitution here, is the deplorable condition of our soldiers in reference to venereal diseases. But, here again, is it clear that the system where in operation has produced all the good anticipated of it? Is the French army, for example, with the benefit of a police regulation of prostitution, in a much better condition than the English army? To those who think and say so, we recommend the study of the Medical Statistics of the French Army for 1862, lately published by authority. In an analysis of that Report, given by a French journal, we read as follows.

"Syphilis is the most cruel scourge of the army. Rather more than one-fifth of the whole number of days of treatment of diseases of soldiers is devoted to patients suffering from venereal diseases. If these days of treatment were divided amongst the whole army, every soldier in it would be four days under treatment for these diseases. And, as it appears that the average time during which each venereal patient is under treatment is from twenty to twenty-five days, it follows that every year one out of every five or six soldiers is affected with venereal disease. And then, again, as every conscript passes at least six years in the service, it follows that, as a rule, every soldier contracts the disease once at all events during that time."

Surely, facts of the kind here referred to demand a satisfactory explanation at the hands of those who recommend here a Governmental supervision of

prostitution. We do not say, that they are incapable of explanation; we do not say, that some more effectual system than the French one might not be invented; nor do we wish in any way to prejudice the general question. All we ask for is, that some reasonable proof should be given of what is generally assumed to be a positive fact; viz., that the general police regulation of prostitution sensibly diminishes venereal diseases in a community. We have stated facts which seem—at all events, until explained away—to throw grave doubt on the correctness of the assumption.

HOMEOPATHY.

THE London Homœopathic Hospital has had a field-day, its annual dinner. About 140 gentlemen were present we read; and amongst them we find distinguished individuals. The great Lord Ebury was chairman; Dr. Rae, the arctic traveller, was there; Professor Masson and Mr. Hughes ("Tom Brown"), men of *Macmillan's Magazine*; etc.

The noble President, in giving "The Health of the Queen", expressed the very vain hope that, if unfortunately her Majesty should ever require assistance, she would send for a homœopathic doctor.

Dr. Rae, in proposing the "Defensive Forces of the Country", remarked that though the army and navy had not yet adopted the practice they had met to aid, he had tried it in all climes and in all countries, and had found it a very excellent friend.

Mr. Hughes ("Tom Brown") warmly advocated the principles of homœopathy, and concluded by proposing "The Health of the Patrons of the Institution". He would not adopt the motto of homœopaths, and say "Similia similibus curantur"; but, as they had so many good names on the list, he would say "Similes similibus procurantur".

The noble Chairman adverted to the unfair opposition offered to homœopathic practitioners. Such conduct appeared to him to be degrading to the medical profession. One of the most eminent of that profession, a short time before his death, which occurred recently, condescended to write "the most unmitigated twaddle" in urging his objections to the principles of homœopathy. He was, however, happy to find that the new school of medical treatment was progressing most rapidly and successfully, and that almost every day brought converts to the cause from the very centre of the enemy's camp. The hospital was in a high state of efficiency, and had already succoured 45,000 patients. There were, however, forty beds at present vacant from the want of funds. The demand for homœopathic practitioners was gradually increasing; and further medical assistance was much wanted in the hospital. In his own immediate neighbourhood there was great room for an experienced man, as he (Lord Ebury) knew five or six noblemen residing near him who were warmly in favour of the homœopathic principles. A portion of the medical community had drawn lines of circumvallation around them, and had done their best to starve them out. They were not starved out yet. There was a number of deserters from the enemy's camp; and the last he heard from them was that, at a presentation to a successful medical man in Liverpool, the gentleman, much to the surprise of all present, had declared his belief in homœopathy, and an-

nounced his intention of devoting the remainder of his life to the propagation of its principles.

Dr. Yeldham proposed "The Memory of Hahnemann". Hahnemann had raised himself from the humblest position, and by his industry, genius, and courage, carved out a niche for himself in the temple of fame. He discovered the folly and hollowness of the old practice of medicine, and after years of study enunciated the principles of homeopathy amid a storm of opposition and persecution that met him on all sides. He was ultimately obliged to fly to Paris, where he expired at the age of 92. In whatever aspect they viewed Hahnemann—like the Apollo Belvidere—he was beautiful, symmetrical, and grand. He raised medicine, which at the best was a mystery, into a noble and God-like science. He proved that man was born for a higher destiny than to be blistered, bled, and physicked.

The toast was drunk in solemn silence.

Lord Ebury is a great reformer, as we all know. He is teaching our Bishops how to manage matters ecclesiastical, and to reform the Church Liturgy. He has long attempted to persuade doctors that they are all a set of blockheads; and that homeopaths alone have the true key to the healing art. No doubt he dabbles in a variety of other ingenious expressions of his reforming tendencies; and we dare say we may add, really innocent tendencies. That Lord Ebury is a small man, we have all of us long known. He has given the world too many occasions to take measure of his mental calibre. And if, therefore, we allude to him at this moment, it is because he has gone out of his way publicly to insult a great man of our profession. Lord Ebury insulted the profession when he said that "one of the most eminent of that profession, a short time before his death"—referring, of course, to Sir B. Brodie—"condescended to write the most unmitigated twaddle about homeopathy". Lord Ebury, in this case, again showed a want of sense as well as of good taste; for it so happens that his son is at this moment canvassing the electors of Westminster. Of course, the son is not answerable for the sayings and doings of the father; but assuredly such public abuse of Sir B. Brodie by the father is not likely to render the medical profession of Westminster very enthusiastic in the cause of the son. However, he has made some amends by informing us that there is a grand opening for a homeopath in his own immediate neighbourhood. If Lord Ebury be not, in this instance, drawing on his imagination for his facts, we will venture to guess that the supply will not long remain behind the demand.

MR. PERRY, Inspector of Prisons, calls the attention of the Home Office to the following state of things in the Coldbath Prisons. One could hardly have imagined such facts could be at this time of day. They really take us back to the state of prisons in the days of the philanthropic Howard.

"The prisoners have amounted in the last week to

the extraordinary number of 1940. Allowing that all the old cells were habitable at night, there would still remain between 600 and 700 prisoners unprovided with cell-accommodation of any kind. The only manner in which this great excess of prisoners can be lodged at night is by placing them in large rooms or dormitories, some of which have hammocks hung in rows to the number of 120 to 160 in a room, and others have beds upon the floor, which, like the hammocks, are so close together that the boards can scarcely be seen between them. It cannot be pretended that the prisoners have not the means of communicating by speech with each other in these dormitories; for, although two officers remain in each room all night, they have no opportunity of perambulating the rooms on account of their crowded condition. Another disadvantage under which the officers on watch are placed is that the offensiveness of the rooms, and the consequent oppressiveness of the atmosphere, render it a matter of much difficulty to keep themselves awake, especially as they have not room to walk about. It is needless to observe upon the gravity of the moral evils which must result from committing persons not already corrupted to the last degree to a prison under these conditions, especially when, from the want of proper cells, many hundreds of persons are placed closely together on benches picking oakum, or as closely in crowded refectories taking their meals; but it may be safely affirmed that no such person as I have supposed can pass through an ordeal without a degree of contamination which almost forbids the expectation that he can escape from becoming a permanent member of the criminal class."

THE requisite amount having been speedily subscribed, the fund raised to indemnify Dr. Bowen for his expenses in the recent action has been closed. The sum of £246:17 has been collected. The law charges in the case amounted to £189:12; the expenses for printing, postage, reporting, etc., amount to £7:14:6; leaving a balance of £49:10:6. At a meeting held at the Liverpool Medical Institution on February 24th, it was resolved unanimously that the surplus be appropriated to the Medical Benevolent Fund.

To discuss the last murdering act of Townley's, his suicide, whether it was or not the act of a sane man, seems to us a pure waste of time and ink and paper. Of course, those who brought him in mad when he was alive, will find an additional justification of their verdict in this last act of his. And also, of course, those who set him down as a responsible murderer, will be content to remark on the suicidal event: 1. That the jury might just as reasonably have brought in a verdict of *felo de se* as the one they gave; 2. That we are not bound to take the verdict of a coroner's jury as the absolute expression of their opinion on suicidal acts—such verdict being notoriously very often guided by feelings of respect for the living relatives of the suicide; and 3. That suicide is after all no proof of a man's being mad. If any of those men of science who considered Townley a lunatic murderer, can find a comfortable

confirmation of their opinion in his self-murder, no one need wish to deprive them of such consolation. But to attempt to argue further on the subject, on the strength of this additional act of his, really seems to us to be a game which will not pay for the candle.

At the recent meeting of the North Wales Branch. Mr. Griffith called upon the members to take up the generous challenge offered by Mr. Carden of Worcester, and, in their joint capacity as a Branch, raise one of the ten fifties, as proposed by Mr. Carden, for the Medical Provident Society. Before the meeting broke up, a large sum was already subscribed—sufficient to ensure the success of Mr. Griffith's proposal. We hope that other Branches will follow the example of the North Wales Branch, and so ensure the addition of a large sum of money to the Provident Society.

THE proceeds of the Propert Testimonial Fund are to be applied to the purpose of founding an Exhibition for the benefit of the Foundation Scholars of the Medical Benevolent College. This is done by the Committee, in accordance with the generous wish of Mr. Propert himself. The Fund has already reached the sum of £700; but the friends of Mr. Propert, and, we need hardly add, the friends of the College, are anxious that the Fund should amount, at all events, to £1,000, in order to secure £30 a year to the exhibitors. We doubt not for a moment that the few hundreds still required will be at once forthcoming; and that his professional brethren will be proud to join in acknowledging the long and energetic services of Mr. Propert, by seconding him in this latest benevolent act with which his name will be permanently associated.

DR. ROBERTSON, of the Sussex Asylum, has published some figures which tell most unanswerably against the management of Bethlehem Hospital. Our readers may remember that when we last spoke of the propriety of taking Bethlehem into the country, we remarked, that probably, if the Governors were to look a little more closely into their affairs, they would find that their money might do a good deal more than it does at present. Our supposition is completely substantiated by these figures. From them it appears that a patient in Bethlehem costs *per annum* more than double of a patient in the Sussex Asylum. Dr. Robertson says that Bethlehem's funds are enough to keep gratuitously five hundred patients of the middle class. And the fact seems to be, that the public do not take full advantage of the place, and because it is not situated in the country. The total admissions of curable cases show, on the last triennial period, a decrease of 378, or two-fifths." Moreover, notwithstanding their expenditure, the Governors

had last year a balance of nearly £4500, besides investing £1600 in land. How the Governors can answer figures like these remains to be seen. We can well understand that London men might be found to approve of the present state of Bethlehem—men not accustomed to sanitary or scientific considerations; but surely men of the counting-house and the ledger must open their eyes when they see spread before them Dr. Robertson's balance-sheet, comparing the expenditure of Bethlehem with the expenditure of the Sussex Asylum.

THE Royal Medical and Chirurgical Society is still a very flourishing body, as we learn from the Report read at the annual meeting on the 1st inst. It still increases in number and in funds, and therefore in the favour of the profession. It numbered 627 Fellows at the end of last year, and no fewer than eleven new members were elected at the last ordinary meeting of the Society. To its library 384 new works were added during the past year. Many valuable presents were also made to it. Mr. Curling gave sixty-nine engravings—portraits of medical practitioners; and Mr. Charles Hawkins ninety engravings. A medal, a likeness of Tiedemann, was presented by his widow to the Society; and one of Dr. Jenner by Dr. Babington. The President, Mr. Partridge, on vacating the chair, had again occasion to detail the losses which the Society had sustained in many valued Fellows who had died during the past year. Especially was remarked the very excellent summary which he gave of the life and labours of the late Dr. Senhouse Kirkes; and the details of that lamented physician's last illness, and his Christian resignation to the decrees of Providence, made a deep impression on the Fellows. The high services rendered to science by the Scientific Committee were also alluded to, and warmly acknowledged by the Society. The Council took the opinion of the Society as to the propriety of continuing to publish the *Proceedings* as well as the *Transactions* of the Society. The Council thought, for several reasons, that the *Proceedings* might be done away with; and a summary of the papers, not published in the *Transactions*, given in an appendix to the volume of *Transactions*. But the Society did not agree with the Council; and passed a resolution to the effect that they wished the *Proceedings* continued; and that the Secretaries would publish them more frequently, and bring them out at an earlier date, than they have lately done. An attempt was also again made to induce the Society to reduce the rents of the Pathological and Obstetrical Societies; but the attempt, as on former occasions, completely failed. We believe that only five hands were held up in favour of lowering the rents. It may, therefore, be said, that the feeling of the Royal Medical and Chirurgical Society was unanimous on the point;

and it is to be hoped that the subject will not again be brought before the annual meeting. It was not shown, on the one hand, that the rents were too high; nor did it appear, on the other, to the Fellows of the Society, that they were in any way called upon, out of mere motives of scientific fraternity, to expend their money in developing either the Pathological or the Obstetrical Societies. The Royal Medical and Chirurgical Society very wisely considered that it was quite as able to advance science by spending its money itself, as by handing over its resources—which it would do, if it let its rooms below their value—to other societies for a similar purpose. Votes of thanks were then given to the President and other officers: and the annual meeting then closed, after some lively debating, in very perfect harmony.

THE statement of the receipts and expenditure of the Society for Relief of Widows and Orphans of Medical Men for the year ending November 30th, 1864, has just been issued. The income of the Society for the year is set down as being £51,953:19:3; this including the sum of £47,567:10:7 returned by the Commissioners for the Reduction of the National Debt, £30,000 has been invested in permanent debenture stock of several railways; and £18,294:10:7 has been invested in the public funds. The grants for relief and self-maintenance amounted during the year to £2166:10. Thirty-one members had been elected since the publication of the last annual statement; twelve had died; and nine had withdrawn. The total number of members is now 462; and 52 widows and 21 children of deceased members are receiving relief from the funds of the Society. The expenses of the Charter, which has come into operation, are set down as £316:10:9. We are glad to find that the number of members in this most useful institution is steadily increasing.

DR. ROGER, physician to the Children's Hospital in Paris, lately brought before the Hospital Medical Society a Clinical Study of Infantile Syphilis. His conclusions are as follow.

In the first observation given, we find proof of a spontaneous dying-out of the syphilitic diathesis in the course of several successive births—a confirmation of the law, that the mother of a child affected with hereditary syphilis does not contract syphilis by suckling her own child, when she herself is infected; and an example of the transmission of syphilis from the child suckled to the nurse. 2. A syphilitic lesion of the mouth having been observed in most cases of transmission of syphilis from the child to the nurse, we must suppose that, in the case referred to, the inoculation was effected by some unobserved lesion of the mouth. Where no such lesion exists, the liquid of syphilitic coryza may be the infecting agent. 3. In cases of syphilis where the nurse and the child are simultaneously affected, the commencement of

the disease in the breast is presumptive evidence that it arose in the child; whilst absence of mammary lesion, and signs of syphilis in other parts of the nurse's body is presumptive evidence against the nurse. 4. Observations given show examples of syphilis acquired by kissing and merely touching the child. 5. Syphilis is not an obstacle to the regular development of cow-pox. 6. Congenital syphilis is rare, with the exception of pemphigus and visceral diseases which are intrauterine affections. 7. The statistics of 249 cases show that hereditary syphilis, in more than half the cases, appears before the end of the first month, and in seven-eighths of the cases before the end of the third month. From which it follows, that infantile syphilis is probably hereditary if it appear before the end of three months, and acquired if it appear after that time. Hence, also, we should select as sources of vaccine matter children who are more than three months old. 8. Syphilitic pemphigus is readily distinguished from the simple pemphigus. The early appearance of the disease—at birth or within two months afterwards—and the situation of the bulli on the palmar and plantar regions are positive signs of its syphilitic origin. Psoriasis and herpes on the same parts also indicate their specific nature. Onychia in the newly born is a lesion even more characteristic of syphilis than it is in the adult. 9. The well known frequency and gravity of syphilitic coryza have been clearly shown. In one instance was given an example of syphilitic laryngitis in a child 8 months old. 10. Bony lesions, or tertiary symptoms, are very rare in children, and difficult of diagnosis. 11. The evolution of infantile syphilis is sometimes very rapid. 12. As regards prognosis and curability of the disease, distinction must be made between cases affected with congenital syphilis, in which the viscera are probably affected, and cases where the disease appears some weeks after birth. The first sort are almost certainly fatal; the latter cases are generally readily cured by mercurial treatment. 13. A preventive mercurial treatment in children born of syphilitic parents is quite useless. The medication must begin only when the disease appears. The direct treatment of the child is infinitely more effectual than its indirect treatment through the mother. 14. Internal treatment is the best. Facts show that infantile syphilis treated in time by mercury may be completely cured, and without danger.

In the November number of the *Annali Univers. di Medic. di Milano*, Dr. Gritti gives an account of clinical experiments made by him in the Milan Hospital with the alkaline and earthy sulphites externally applied. He employed the sulphite of soda as lotion (ten parts in 100 of water); and also as an ointment, mixed with a glycerole of starch, which he highly praises, as being free from smell and rancidity—820 grammes of pure glycerine are mixed with 100 grammes of sulphite of soda, then are added 80 grammes of starch: the mixture is gently heated in a bath until it becomes of the consistence of a soft paste. This ointment should be spread on the linen at least twenty-four hours before it is used. The chief uses of the sulphites, as used in solution, are—1, diminution of the secretion; 2, diminution and removal of bad odours; 3, rendering viscous and preventing the spread of bad secretions; 4, destroying the elementary constitution of pus; 5, hastening

repair; 6, diminishing the sensibility of the surface; 7, hastening cicatrisation.

M. RAYER, the reporter of the Commission appointed by the Academy of Sciences on Pellagra, speaks thus of the work of M. Roussel:

"M. Roussel's work is very complete, and is the result of extensive reading, of personal observations made during his travels, and of communications obtained from other observers. It contains a full description of pellagra. We find in it an account of the nervous symptoms which appear at its outbreak; documents of every kind; a critical summary of the opinions of Landouzy, of Billod, and of Benvenisti; an excellent history of the disease; a full discussion of the connexion between pellagra and the eating of diseased maize—maize affected with a fungus called *verdet* in French, and *verderame* in Italian. M. Roussel expresses a strong opinion as to there being a toxic influence presiding over the development of endemic pellagra. In a word, his work is a cyclopædia of pellagra. The Commission, therefore, proposes that the Academy shall accord to M. Roussel its prize of 5000 francs."

A NEW journal has appeared at Brussels, entitled *L'Art Médicale*. It is to be published on the first and third Sundays of each month.

A few weeks ago, a monument to Riberi was inaugurated in the University of Turin. The ceremony was splendid, and was attended by many of the nobility and some of the royal princes.

On February 3rd, Rokitansky was solemnly invited to perform, and performed, the first *post mortem* examination made in the new hospital at Vienna (Rudolph's Hospital).

REMOVAL OF FOREIGN BODIES IN THE EAR.

In a recent number of the *Bulletin Général de Thérapeutique*, M. Guersant makes the following remarks on removal of foreign bodies from the ears of children.

If we except the concretions of cerumen that are principally met with in the aged and rarely amongst children, it must be said that foreign bodies in the external auditory canal are more often observed in youth than at more advanced ages. For our part, we have seen a considerable number of them in hospital and private practice.

The bodies thus met with are very diverse: hardened cerumen, pebbles, stones extracted from rings, or ear-rings, pearls, peas, shells, beans, fragments of glass-tubes, balls of paper, seeds, etc. Insects have been mentioned, but we have not on any occasion met with them.

All these foreign bodies, when they remain in the auditory canal, principally those which swell up, may occasion severe accidents: such as inflammation, suppuration, buzzing, cerebral symptoms, meningitis. Hence it is important to relieve, as soon as possible, children who have in their ears a pea, or a seed, which may swell up on becoming moist. The surgeon ought, before all, to ascertain with accuracy that a foreign body exists, because very dangerous attempts have often been made in cases where no

such body has been present. If, after the patient has been placed in a proper position, and the light has been directed into the canal, the foreign body is recognised, the surgeon ought to act differently, according to the case.

1. The foreign body may be a fluid: such as water in swimmers, or oil. In these cases, a single shake given to the head has sufficed to make the fluid flow out.

2. Sometimes there is hardened cerumen. A simple ear-pick, previously dipped in oil, will allow this concretion to be expelled. It may be necessary first to soften the cerumen by several injections of luke-warm water, or of oil or glycerine.

3. Peas, beans, seeds, or balls of paper swell and soften. They may be caught and hooked out sometimes easily enough, either with small forceps, or with a small short hook.

4. Hard bodies, as pebbles, shells, hard seeds, can be removed in several manners. As was very anciently advised, and as has been done by Menière, injections may be employed. We have, says M. Guersant, very often used these means, and for all sorts of foreign bodies. It is necessary, however, to act in a certain manner, with much perseverance; and the relations ought to be shown how to practise these injections, because it is often necessary to repeat them several days following before success is obtained. In order to apply injections, it is well to procure an Eguisier's irrigator, fitted with a straight tube and filled with cold, or better with luke-warm water. The child should be wrapped in a cloth, folded several times double, so that the arms are thus kept wrapped up; the cloth ought to surround the neck of the child, in order to avoid wetting it. The head should also be held in a somewhat inclined position, and a basin should be placed under to receive the water. The surgeon should direct the pipe of the irrigator into the auditory canal, propelling the jet of water very slowly at first, so that it may pass between the foreign body and the walls of the canal, strike on the membrane of the tympanum, and in its return drive out the foreign body, which will sometimes escape after the first injection. It is important that the surgeon, at the time of performing the irrigation, should draw the lobe of the ear alternately upwards, downwards, forwards and backwards, in order to modify the direction of the jet. The operation should be repeated several days following, if no results follow the first injection; and the relatives should be instructed how to make the injections. M. Guersant has seen cases in which the foreign body has only been removed after persevering for eight or ten days. When this means is not attended by success, the instruments which appear most likely to succeed, are simple small forceps, which are always useful in cases of soft bodies, paper, lint, etc.; or better, the ordinary scoop or Leroy d'Etiolles' small scoop. In many cases, the instrument should be guided principally along the lower side of the canal. As the introduction of scoops is always more painful than the use of injections, and gives rise to more struggling on the part of children, M. Guersant observes that, when it is necessary to use this means, we should not hesitate to employ chloroform. When the child happens to be manageable, besides the inclined position of the head, M. Debout has recommended the mouth of the patient to be opened. It is sufficient to introduce the end of the little finger into the external auditory canal, and to make the lower jaws move in order to become convinced of the enlargement undergone by the canal each time the condyle of the jaw leaves the articular surface. This attitude facilitates the employment of all the preceding operations; but that which it aids most is the employment of injections.

Association Intelligence.

BRANCH MEETING TO BE HELD.

NAME OF BRANCH.	PLACE OF MEETING.	DATE.
BIRMINGHAM AND MIDLAND COUNTIES. [General.]	Medical Department, Old Library, Birmingham.	Thursday, March 9th, 1865.

SOUTH-EASTERN BRANCH: EAST KENT DISTRICT MEDICAL MEETINGS.

The next meeting of this Branch will be held at the Ship, at Faversham, on Thursday, March 16th, 1865, at 3 P.M.

Notices of papers or cases to be communicated, should be sent immediately to the Honorary Secretary.

ROBERT L. BOWLES, L.R.C.P.,

Honorary Secretary.

Folkestone, March 1st, 1865.

NORTH WALES BRANCH: INTERMEDIATE MEETING.

The Intermediate General Meeting of this Branch was held on Friday, Feb. 24th, 1865, at the house of Dr. Roberts, Hafod Elwy, St. Asaph. In the unavoidable absence of the President (Dr. Williams of Mold), at the commencement of the meeting, T. T. GRIFFITH, Esq., of Wrexham, was unanimously voted to the chair. There were sixteen members present.

The members of the Council of the Branch proceeded at 12 o'clock noon to despatch the executive business, particulars of which are subjoined.

Treasurer's Account. The following was the statement made.

Receipts.

Balance in hand on the 1st January, 1864...	4	5	1
Amount of half-crown subscriptions and arrears received from the 1st of January, 1864, to the 31st of December, 1864.....	4	2	6
	8	7	7

Disbursements.

The Secretary's official expenses, as per account, made up to the 31st Dec., 1864 ...	6	14	9
Balance in favour of the North Wales Branch on January 1st, 1864	1	12	10
	8	7	7

Annual Meeting. It was agreed to hold the annual meeting at the Royal Hotel, Rhyl, on Tuesday, July 4th, at 11.30 A.M. for the transaction of the business of the Council, and at 12 o'clock noon for the General Meeting.

President-Elect for 1866. Dr. Conway Davies of Holywell was recommended (subject to confirmation at the annual meeting) for the office of President-Elect for 1866.

Medical Provident Society. Mr. GRIFFITH brought forward the subject of the Medical Provident Society, and advocated in an eloquent manner the claims of the Auxiliary Fund. He stated his views respecting the proposition so generously offered by Mr. Carden of Worcester; and wished that the members of this Branch would meet the challenge, and in their corporate body raise the sum of £50, so that one of the ten £50 could be guaranteed. He hoped, he said, that the other Branches of the Association would do likewise; and that those which con-

sisted of double or treble the number of members would increase their contributions in proportion. He then headed the list with a handsome subscription; and, after it had been handed round to the gentlemen present, the sum of £22:6:6 was collected.

It was decided that circulars should be sent to all the absent members of the Branch inviting their subscriptions; and that Thomas Taylor Griffith, Esq., of Wrexham, be requested to act as treasurer, an office which he kindly accepted.

Papers and Cases. The following were read.

1. On Hydrocele. By T. T. Griffith, Esq., Wrexham.

2. On Bronchocele. By T. Eyton Jones, Esq., Wrexham.

3. On Asthma; with Remarks upon Dr. Hyde Salter's Views. By O. Roberts, M.D., St. Asaph.

4. Case of Aneurism, benefited by the Internal Administration of the Iodide of Potassium. By J. Conway Davies, M.D., Holywell.

5. Case of General Phlebitis. By E. Williams, M.D., Wrexham.

6. Case of Gall-Stones, where an immense number passed away, some of a very large size. By Ll. Lodge, Esq., St. Asaph.

7. Case of Acute Peritonitis, terminating in general Abscess of the Peritoneum, which discharged by the Navel. By J. R. Hughes, M.D., Denbigh.

8. On Softening of the Brain; with Observations on Mental Diseases. By G. Turner Jones, Esq., Denbigh.

9. Case of threatening Paralysis in a person 65 years of age. By O. Roberts, M.D., St. Asaph. Amaurosis had suddenly come on, with a pulse of 140, feeble. All the symptoms were removed by venesection to the amount of four ounces. The amaurosis returned in twenty minutes, when further venesection to six ounces removed all symptoms permanently.

10. On Carbolic Acid; its Use and Composition. By W. Williams, M.D., Mold.

11. Case of Acute Glaucoma, cured by Iridectomy. By A. E. Turnour, M.D., Denbigh.

12. Case of Severe Injury to the Eye. By T. Evans Jones, Esq., Llanasa.

All the above papers and cases elicited long and interesting discussions; and after being thus profitably occupied for upwards of three hours and a half, the business of the meeting was brought to a close.

Dinner. All the members present, with the Rev. Mr. Browne, vicar of St. Asaph, and others, were hospitably and sumptuously entertained at dinner in the evening, by Dr. Roberts, at his residence, Hafod Elwy, and were delighted with the cordial reception given them by their worthy host.

HIPPOPIAGY. The question has advanced, and there can be no longer any doubt that horseflesh is wholesome, agreeable to the taste, rich in nourishing properties, and destined to fill up a void in the food of the working classes. France contains more than 3,000,000 horses. These animals are renewed every twelve or fifteen years, for after a time horses are no longer useful for work. The fifteenth part of 3,000,000 is 200,000, and if we set aside 50,000 unfit for food from disease, there still remain 150,000 healthy animals, which would furnish 6,000,000 lbs. of food. That weight is equivalent to the meat furnished by 90,000 to 100,000 head of cattle. Horseflesh is very often eaten as *filet de bœuf aux champignons* in the Palais Royal. In Denmark it is publicly sold; and at Vienna there are seven special butcheries, where, in 1862, 1,954 horses were retailed at an average price of 62 francs.

Reports of Societies.

LIVERPOOL MEDICAL INSTITUTION.

JANUARY 26, 1865.

HENRY LOWNDES, Esq., in the Chair.

Gastric Ulceration. Mr. RAWDON exhibited specimens of extensive ulceration of the stomach, and perforation of the cæcum.

Uterine Tumour. Mr. HAMILTON narrated the following case. On Nov. 17, 1864, he was called to see a lady who supposed herself threatened with a miscarriage. She had been married three years, and had miscarried twice previously. On the present occasion, she considered herself to be in the third month of pregnancy. She was suffering from severe pain in the back, and in the lower part of the abdomen, accompanied with the discharge of clots of blood. An uterine examination could only detect what felt like a clot of blood just within the os uteri. The treatment consisted in the administration of styptics, and free doses of opium to relieve pain. For three weeks she remained much in the same condition; the pain rather increasing in intensity, and being confined to a spot immediately above the left horizontal ramus of the pubes. On careful examination of this part, a hard substance could be distinctly felt through the abdominal parietes, of about the size of an orange, and very tender on pressure. The pain increased in severity; and to relieve it both opium and morphia failed. There was a total loss of both sleep and appetite, together with a weak pulse. Her condition was, under these circumstances, considered to be exceedingly critical. Vaginal examination could detect nothing further than a thickened and indurated condition of the uterine wall; the tumour felt through the abdominal parietes remaining much the same in size, but more tender on pressure. Four weeks after the commencement of the attack, there were evidences of a purulent discharge taking place *per vaginam*. From the history prior to this attack, a recurrence of syphilis was suspected; but as there were no indications, special treatment was not employed. Since her marriage in March 1861, the lady had suffered from several attacks of syphilitic psoriasis, which appeared to have been communicated from her husband, who was suffering from the same disease six weeks after marriage. In his case, the eruption manifested itself chiefly over the scrotum and hands. Primary disease had been contracted by him some months prior to his marriage, and the first appearance of the eruption on the wife was six months after marriage. A mercurial plan of treatment was adopted; and a few days prior to the present attack, she expressed herself as feeling perfectly well. Shortly, however, Mr. Hamilton was called in again, and found her in the condition already described. On the appearance of pus in the discharge, and with this syphilitic history, bichloride of mercury in doses of 1-32nd of a grain, was given every four hours, but without any abatement of the symptoms. Calomel was then substituted in quarter-grain doses every four hours, combined with mercurial inunction. This plan of treatment speedily resulted in an entire cessation of the pain. Her condition now improved daily.

On January 8th, 1865, she was seized with a sudden pain in the back and loins, lasting two or three hours, and then subsiding. Eight hours afterwards, she passed *per vaginam*, without pain, a tumour of about the size of a goose's egg; which, from its appearance, must have been separated for several days

before it was passed. On cutting into the mouth it presented the characteristics of an ordinary fibrous tumour; but careful examination failed to detect anything like a pedicle. The tumour was exhibited to the Society.

Dr. Shearer, Mr. Steele, Mr. Hakes, Dr. Skinner, and Dr. Telford took part in the discussion that followed.

HARVEIAN SOCIETY OF LONDON.

THURSDAY, FEBRUARY 2ND, 1865.

J. C. LANGMORE, M.B., President, in the Chair.

REMARKS ON THE ANTECEDENTS AND TREATMENT OF PHTHISIS PULMONALIS. BY C. DRYSDALE, M.D.

IN order to speak of the treatment of phthisis, the author said it was absolutely essential that the antecedents of the disease should be well studied, and, if possible, removed. This would not only prevent a large number of cases of the disease, but give the best hints as to the treatment of any particular case. In 1780, a squadron, in ten weeks' cruise, had 2,400 men laid up with scurvy, a disease now rarely met with. He would, therefore, glance briefly at the causation of consumption.

Authors, such as Lugol, Piorry, Walshe, and Edward Smith, who had used the numerical method, had found that the parents of one-fourth of their consumptive patients had had the complaint. *Scrofula* in the parents is a frequent antecedent. *Aged parents and very young parents* are liable to phthisical offspring. *Excessive sexual indulgence* or masturbation in the parents, or generative debility, is a frequent antecedent. *Intemperance*. The children of drunkards, or even of gouty persons, are liable to phthisis; and Copland and others have considered *excessive tobacco-smoking* in the parents as a frequent antecedent of rickets and phthisis.

Personal Antecedents. Employment. Dr. Greenhow had stated that, if the mortality in England and Wales from diseases of the respiratory organs, including consumption, could be reduced to the proportion found in the most favoured districts, there would be an annual saving of forty-five thousand lives. Dr. Christison's contribution to the knowledge of the causation of phthisis was the most important of all, in the author's opinion. He shows that the amount of mortality from phthisis in towns is in a greater ratio than the ratio of their general mortality. Speaking of Scotland, he says the annual mortality from phthisis is 237 in 100,000. Dividing the mainland into towns of 10,000 and upwards, and the rural mainland, the mortality from phthisis is, in the towns 333, and in the country 186. In Glasgow, it rises to 385 in 100,000; whilst in Berwickshire, a fine rural country, it is 104 in 100,000; the annual general mortality of Glasgow being 1 in 38, and that of Berwickshire being 1 in 70. In England, Dr. DRYSDALE remarked, where the annual mortality, though low, was higher than that of Scotland—being 1 in 45 annually in England, and 1 in 48 in Scotland, 1 in 51 in Sweden, and 1 in 55 in Norway—the same law holds good. Thus in Hertfordshire, a very rural county, the annual number of deaths from consumption is 179 in 100,000; it is 363 in 100,000 in Liverpool (a most unhealthy town), 331 in 100,000 in Manchester, and actually 402 in 100,000 annually in Merthyr Tydfil. In London, it is 273 in 100,000. Dr. Christison mentions that there are spots where the natives born and reared there are not subject to phthisis; viz., the western islands of Scotland, where there are no towns. Hence the theory is pretty clearly made out, that towns, with their unwhole-

some occupations, are the main causes of this terrible disease. Thus we must lament the recent augmentation of the size of our large towns, whilst the population of the rural districts is nearly stationary.

Other Personal Antecedents. Alcoholism, in the author's experience, frequently produced consumption. Copland and others had laid great stress on the effects of sexual excess and masturbation. Dr. Edward Smith found that 22 per cent. of his own consumptive patients had had *involuntary seminal emissions*. Mental exertion too severe and long continued, *sad emotions, disappointed ambition, or love*, lead frequently, among the educated classes, to decline. *Seasons.* The influence of seasons is indeterminate. *Climate or topical influence.* Consumption is found in all climates, and evidently depends far more on the employment of the natives of any country, than on other circumstances. In South Africa, according to Livingstone, the disease is not found among the savage tribes south of the Zambesi. *Poverty.* According to Villermé, Lombard, etc., the disease is much more frequently met with among the poor than the rich. The author observed, that the way in which poverty acted was, in this country, that it drove the peasant from his rural occupations into the town, where, in addition to poverty, there was unwholesome occupation, such as grinding or slopworking, to exhaust them. He quoted examples from the daily papers, of death by starvation among the London work-people, as being frequent; and of want as leading frequently to decline. Dr. Edward Smith's evidence showed that the cost of food weekly for the silk-workers was 2s. 2½d.; needlewomen, 2s. 7d.; kid-glovers, 2s. 9d.; shoemakers, 2s. 7½d.; stocking-weavers, 2s. 6½d., per adult. And Dr. Smith adds: 1. No class under inquiry exhibited a high degree of health; 2. The least healthy are the kid-glovers, needlewomen, and Spitalfields weavers; 3. The average quantity of food was too little for health and strength. Great towns, then, Dr. Drysdale remarked, caused consumption by the unhealthy occupations, conjoined with the poverty of the work-people. The more unhealthy, too, the occupation, the worse remunerated in many instances. The fact of their being unhealthy kept all who could afford a choice out of their ranks; but the destitute offspring of a Hampshire or Wiltshire labourer with a large family had no choice. He was penniless and uneducated, and thus became a candidate for occupations of unwholesomeness, varying from the Sheffield grinder to the slopworker of Whitechapel; and thus phthisis abounded. The evil commenced, he said, with the enormous families brought into the world by the country labourer, of all men the most uneducated and improvident. Thus Mr. Fawcett, at Brighton, in January last, says: "I know our agricultural labourers well; and, I ask, what is their condition? It is this, that their wages are so small that no parent can afford to send his children to school, and insufficient to provide them with the bare necessities of life." Consumption, the author said, was now one of what Mr. Malthus had called the *positive checks* to population in this country, and had taken the place of those rapidly destructive epidemics of former days, still met with in less prudent countries, such as India and China. It was consumption we ought now to endeavour to prevent, even more than fevers, about which so much was talked. Mr. Darwin, in his *Origin of Species*, as well as Huxley and Lyell, had, like all scientific men who had examined the subject, given in their adhesion to the doctrines concerning the tendency of population to exceed the food provided for it: these doctrines were propounded by Mr. Malthus in 1799, and were now axiomatic. This tendency of all animals

and vegetables to reproduce their species too fast for subsistence is true of man even in his present state of civilisation; and hence the less thoughtful and the uneducated classes were continually bringing into the world a large number of unfortunate children, who, being ill nourished and cared for, were early cut off either by rickets, scrofula, or phthisis. "Nature," said the discoverer of this law, Mr. Malthus (*On Population*, vol. ii), "cannot be defeated in her purposes. The necessary mortality must come in some form or other; and the extirpation of one disease will only be the signal for the birth of another, perhaps more fatal." Mr. J. S. Mill has forcibly remarked on the sentimentality observable on this question: "Whilst a man who is intemperate in drink is discountenanced and despised by all who profess to be moral people, it is one of the chief grounds made use of in appeals to the benevolent, that the applicant has a large family, and is unable to maintain them. Little advance can be expected in morality until the producing large families is regarded with the same feelings as drunkenness or other physical excess; but whilst the aristocracy and clergy are foremost to set the example of incontinence, what can we expect from the poor?" (*Political Econ.*, vol. ii, note.)

The author had entered thus at length into the question of poverty as depending on population and capital, in order to account for the amount of consumption and early death among the labouring classes, being caused by their too rapid multiplication of families. A remarkable confirmation of this was afforded by Dr. Smith's questions from 1,000 hospital patients affected with phthisis. Thus he found that the parents of his patients had had, on an average, 7.5 children. In some of the families, there were as many as twenty-three children. We can well imagine to what privations in early life these patients had been exposed by the reckless fecundity of their parents.

Pathological Antecedents. Measles and typhus fever, with diarrhoea and dysentery, were not unfrequently the precursors of phthisis; and all causes which tended to lower vitality might produce it, either in the parents or offspring.

Treatment. Before the sixteenth century, the treatment of the disease was rational, since Hippocrates, Celsus, etc., prescribed open-air exercise and good food. It was Paracelsus and the iatro-chemists and astrologers in the sixteenth century, who had introduced the use of specifics, such as mercury and antimony, in the treatment of the disease; and their crude theories had more or less influenced their successors up to this hour. Dr. Griffith had introduced his mixture into the treatment of the disease; Cullen used acetate of lead for hæmoptysis. Dr. Wells tried all kinds of drugs on his patients. Dr. Hughes Bennett, in 1853, had, in his work on *Fatty Diet in Consumption*, given a death-blow to the experimental or specific school in the treatment of this disease. Nevertheless, even the most eminent physicians had a great tendency to relapse into the special treatment of consumption; and, in 1861, we find Dr. Beau, of the Hôpital de la Charité, treating his consumptive patients with pills containing two grains of carbonate of lead, several during the day, in order to cure the disease. M. Piorry, too, had asserted recently that, in the first stages of induration of apex without softening, inhalations of iodine vapour frequently effected a cure; and, although this plan had not crossed the English Channel, the Atlantic had brought a most enthusiastic advocate of inhalation as a cure for consumption. Dr. Churchill had said of his hypophosphites, "I regard these as prophylactic and curative in every stage of phthisis. I know that they will prove, not only as sure a remedy in con-

sumption as quinine in ague; but also as effectual a preventative as vaccination in small-pox"; and a recent critic in the *Lancet*, September 1864, seemed to believe Dr. Churchill. Dr. Drysdale said he was afraid the critic in the *Lancet*, like other able men, had lost his logical powers for the moment, since the hypophosphites had been proved to be quite inert by a commission of the Academy and by Dr. Quain. Dr. Sales-Girons' instrument for pulverising liquids was a most useful one in palliating cases of ulcers in the larynx or trachea in consumptive patients. It was praised by Trousseau and by Drs. Sieveking and Gibb, etc. Dr. Cotton had read, before the Medical Society, a paper, giving the result of his experiments at the Brompton Hospital on cases of uncomplicated phthisis, by means of a host of remedies, each tried on twenty-five cases; viz., phosphorus, liquor potassæ, hydrochloric acid, iodide of potassium, iodide of iron, etc. Such experiments, the author thought, were far worse than useless; and indicated that the method of conducting therapeutical inquiry was still in its infancy. The experimenter takes a number of cases of the disease, occurring in individuals with all varieties of idiosyncrasy. Some die, some get better, some get worse. But time has elapsed; the patients have lived well or ill; and their circumstances have changed—a host of facts have occurred vitiating the experiment. The true method of therapeutics in this case is the deductive one; and this was the idea also of the best writers on this melancholy disease, such as Williams, Walshe, Hughes Bennett, and Parkes. Dr. Williams (*Lancet*, April 1862) says, "The proper treatment seems to be that which is calculated to improve nutrition." There are few remedies of any importance; but one stands apart, cod-oil. Dr. Walshe makes scarcely any reference to any other drug in the treatment of phthisis, but cod-liver oil, which is, he thinks, most efficacious in the third stage. Dr. Hughes Bennett much objects to the *nimia diligencia medici* in phthisis; and insists that acetate of lead is of no use in hæmoptysis; and that the treatment, to be successful, must be as simple as possible, consisting of cod-liver oil, exercise, and good food. (*Principles of Med.*) Dr. Parkes, admitting the value of cod-liver oil, yet lays far the greatest stress upon abundant exercise in the open air, with plenty of good food, for the cure of the disease. He never mentions any drug in the treatment. (*Hygiene*, 1864.)

Climate. The best climate for the phthisical is that wherein they can take the most open-air exercise. For those inclined to bronchitis, nothing can be better than the climate of Upper Egypt, which, in January and February, has an average temperature of 64° Fahr.; in spring, Mentone seems admirably adapted for bronchitic cases. To persons—the immense majority of the consumptive—who must work in order to live, the best advice, perhaps, is, that they should emigrate to South Africa or Australia, and there, abandoning all in-door occupations, which they can do in a new country, although this would be out of the question in over-peopled countries like this, betake themselves to some out of door occupation. This would cure hosts of cases. Persons not liable to bronchitis, should live as much as possible out of doors, and take as much exercise as their strength permits. The Crystal Palace was an admirable resort.

Summing up these results, the author said, pulmonary consumption does not exist in all localities. It is very hereditary; and is found in the children of parents exhausted by overwork of body or mind, by intemperance, or by weakened organs of generation. It is mainly caused by the unwholesome occupations followed in towns, which confine the citizen

without sufficient air and exercise. Poverty, which is due to over-population causing low wages, is the principal source of crowding into towns; since the prolific country labourer brings up a large family without either education or means of livelihood, and these must accept the most unwholesome occupations for very low wages. Lastly, the treatment as well as the prevention of phthisis consists entirely in attention to air, exercise, and good food; and no drug specific can ever be expected to be discovered for a disease, which is evidently a blight of the vital powers.

Finally, he related several cases that had come before him of recovery from the disease.

Correspondence.

MEDICAL ERRORS.

LETTER FROM GEORGE JOHNSON, M.D.

SIR,—Dr. Barclay tells us that "there ought to be, and must be, a firm basis laid in inductive reasoning for our medical beliefs." It is remarkable that, in maintaining this opinion, he appears to consider that he stands almost alone in the profession. We fancy that we hear him exclaiming, with the prophet in the wilderness, "I, even I only, am left." "The philosophy of induction," he says, "has been lost sight of altogether" in medical science; and the cures reported by the homœopaths will bear comparison with hundreds detailed in medical periodicals, and even in the standard works of medical literature.

These statements, proceeding from one so eminent as Dr. Barclay, will, without doubt, be highly appreciated by those to whom they apply. It appears to me, however, that these sweeping assertions do a great injustice to the labours of many members of our profession, who, during the last quarter of a century, have been cutting the ground from beneath the edifice of homœopathy, not by writing and talking much of logic and the canons of induction, but by showing what is the true nature of disease,—what the natural process of cure,—in what way art may assist or hinder this process,—and what, therefore, is the real influence of treatment. The homœopaths have shown, as they think, that such diseases as cholera, acute pneumonia and pleurisy, typhus and typhoid fever, acute renal dropsy, and others, may be cured by globules. We have shown, and are daily showing, that recovery from all these diseases may take place by the unaided efforts of nature; and we are constantly, though perhaps slowly, learning when and how to interfere beneficially in the treatment of disease.

The question between Dr. Barclay and me is mainly one of pathology. What is the nature of that disease which we call cholera? and in what particular? What is the relation between the gastrointestinal symptoms and collapse? Dr. Barclay believes that some of the worst symptoms result from thickening of the blood by loss of its serum; and he infers that to increase the intestinal discharges is an irrational and a mischievous practice. I, on the contrary, maintain that the vomiting and purging are the means by which a natural cure is effected; and that to oppose this curative effort of nature by opiates and astringents is as injurious, as it would be to suppress the eruption of scarlet fever by exposure to cold. It is obvious that, between those who maintain these antagonistic views as to the nature of a disease, there can be no agreement on the question of its treatment.

I have reason to believe that some of your readers would be interested in having this most important subject of the nature of cholera systematically brought before them in the pages of the JOURNAL. I purpose therefore, with your permission, to send you from time to time, in as condensed a form as I can, the main facts and arguments which have led me to the conclusion that the theory adopted by Dr. Barclay is erroneous, and its practical application to the treatment of cholera is mischievous. Whether your readers agree with me in my conclusions, or whether they dissent,—some probably will do one, and some the other,—all will, at any rate, see that I have more and better reasons for my opinions than Dr. Barclay in his book has given me credit for. I am, etc.,

GEORGE JOHNSON.

11, Savile Row, February 2nd, 1865.

NEURALGIA AND HYPOSULPHITES.

LETTER FROM T. HAYES JACKSON, M.D.

SIR,—Last autumn I was attacked with neuralgia in my back, left thigh, and leg; the pain extending to the heel. After this, I had dysentery and low fever. Three weeks' treatment cured the dysentery and fever; but the neuralgic pain became more acute. For three months, I suffered "many things of many physicians"; and twice tried change of air in an elevated situation.

Nothing better, I was next advised to try Buxton; so I "threw physic to the dogs", and proceeded thither; and, as the lady said when she had resided in Turkey "that she lived like the Turks", during my sojourn of seventeen days among the Buxtonians, I became an amphibious biped. I returned, much relieved from pains; but, alas! Buxton waters were only for the past, not for the future. In a few weeks, the pain became more agonising; and I lay in bed for days a gaunt specimen of mortality stuffed with drugs, potent and impotent. Hypophosphite of soda having failed to relieve (in September last) in ten grain doses (as recommended in an able article written by Dr. Radcliffe, in the BRITISH MEDICAL JOURNAL for November 1863), I determined to make a second trial of the hypophosphite of soda in much larger doses. I began with a drachm three times a day in beef-tea. In a few days, the effect was magical; the pain that I had endured for six long weary months subsided; and now I hope to enjoy better health, and thank God for all his mercies.

I am, etc., THOS. HAYES JACKSON.

Darlington, Feb. 23rd, 1865.

UNQUALIFIED ASSISTANTS.

LETTER FROM A. B. STEELE, Esq.

SIR,—As your correspondent, Dr. Willett, has appealed to the professional public against the ruling of the judge of the County Court as to the rights of those who employ unqualified assistants, I feel tolerably confident, that the profession as a body will confirm the decision of the court, and will recognise the justice and propriety of the verdict, however personally inconvenient it may be to the plaintiff.

In the interests of the public and the profession, as well as in accordance with Section XL of the Medical Act, the legal maxim, "*Qui facit per alium facit per se*," has, in my opinion, been legitimately acted upon in this case. To entrust an unqualified deputy with the management of a branch practice five miles distant from the residence of the principal, appears to me an unwarrantable and dangerous abuse of the privilege which, within proper limits, is useful and expedient; namely, the employment of medical stu-

dents as "improvers", to assist a practitioner, under the immediate and constant supervision and control of his own more experienced and competent guidance. I am, etc., A. B. STEELE.

Liverpool, February 25th, 1865.

Medical News.

APOTHECARIES' HALL. On February 23rd, 1865, the following Licentiates were admitted:—

Clarke, William Hughes, Bernard Street, Russell Square
Spencer, Lionel Dixon, Newcastle-on-Tyne

At the same Court, the following passed the first examination:—

Bobart, William Mathews, Derby

APPOINTMENTS.

*BUDD, S., M.D., elected Consulting Physician to the Exeter Dispensary.

*ELLIOT, W. H., M.D., elected Consulting Physician to the Exeter Dispensary.

*SHAPTER, Thomas, M.D., elected Consulting Physician to the Exeter Dispensary.

ROYAL NAVY.

BRIETZKE, Henry, Esq., Acting Assistant-Surgeon, to the *Victory*, for Haslar Hospital.

BRIDGFORD, Richard F., Esq., Assistant-Surgeon, to Plymouth Hospital.

CRAIG, Hugh B., Esq., Acting Assistant-Surgeon, to the *Royal Adelaide*, for Plymouth Hospital.

DAVIDSON, Samuel, Esq., Acting Assistant-Surgeon, to the *Royal Adelaide*, for Plymouth Hospital.

FERGUSON, Robert, Esq., Assistant-Surgeon, to the *St. Vincent*, for the *Seabark*.

LEWIS, John S., Esq., Assistant-Surgeon, to Haslar Hospital.

MARTIN, James, Esq., Acting Assistant-Surgeon, to the *Victory*, for Haslar Hospital.

NELSON, Robert, Esq., Assistant-Surgeon, to Haslar Hospital.

SIMPSON, John, Esq., Assistant-Surgeon, to the *Edgar*.

SMART, Henry S., Esq., Assistant-Surgeon, to the Artillery Division of Marines.

STEWART, James, Esq., Acting Assistant-Surgeon, to the *Victory*, for Haslar Hospital.

STEWART, William H., Esq., Acting Assistant-Surgeon, to the *Royal Adelaide*, for Plymouth Hospital.

SWEETMAN, Stephen, Esq., Assistant-Surg., to Greenwich Hospital.

MILITIA.

WALTER, J., Esq., to be Assistant-Surgeon Kent Artillery Militia.

VOLUNTEERS, (A.V.=Artillery Volunteers; R.V.=Rifle Volunteers):—

BLAIR, T., Esq., to be Hon. Assistant-Surgeon 10th Ayrshire R.V.

COOPER, W., Esq., to be Assistant-Surgeon 1st Gloucestershire A.V.

HUTCHINSON, G. S., Esq., to be Honorary Assistant-Surgeon 1st Norfolk A.V.

M'GEORGE, S. J., Esq., to be Assistant-Surgeon Liverpool R.V.

TREND, T. W., Esq., to be Assistant-Surgeon 4th Administrative Battalion Hampshire R.V.

BIRTH.

CURGENVEN. On February 27th, at 11, Craven Hill Gardens, the wife of J. Brendon Curgenven, Esq., Surgeon, of a daughter

DEATHS.

CATHERWOOD, Alfred, M.D., at Hoxton, aged 62, on February 19.

CHALDECOTT. On February 26, at Dorking, aged 36, Mary Kate, wife of *Charles W. Chaldecott, Esq.

GIRDWOOD, James, Esq., Surgeon, at Falkirk, aged 67, on Jan. 29.

JONES. On February 16th, at Sydenham, aged 39, Eliza, wife of Edward Jones, M.D.

MACRATH, Miles M., Esq., Assistant-Surgeon R.N., at Hongkong, aged 29, on December 16, 1864.

MARSHALL, William, Esq., Surgeon, at Antwerp, aged 39, on Feb. 1.

MURRELL. On February 15th, at Lewes, Harriet, wife of William H. Murrell, Esq., Surgeon.

Rix, Samuel B., Esq., Surgeon, in South Africa, aged 23, on December 13, 1864.

ROUSE. On February 17th, Elizabeth, widow of Richard D. Rouse, Esq., Surgeon, late of Great Torrington, Devon.

STONE. On February 17th, at 60, Fetter Lane, aged 15, Mary Eliza-beth, second daughter of Erasmus Stone, L.R.C.P.Ed.

Taylor, John H., M.D., at Guildford, aged 79, on February 13.

WYATT. On February 19th, at 31, Adelaide Road, aged 6 weeks, Jessica C. A., daughter of G. R. Wyatt, M.D.

MISS BALY, the late Dr. Baly's sister, has been favoured by Her Majesty with a residence in the palace at Hampton Court.

THE DALY CASE. A Committee has been formed to collect subscriptions to defray the expenses of Mr. Norton, incurred by him in connection with the case of Timothy Daly.

TESTIMONIAL TO DR. SWALLOW. The members of the South London Medico-Ethical Society have given Dr. Swallow, their Honorary Secretary, a silver cup, as an expression of their thanks for his valuable services to them rendered.

BARON LIEBIG AND SEWAGE. It has been moved and carried in the Common Council of London "that the thanks of this court be presented to Baron Liebig, President of the Royal Academy of Science at Munich, for his very valuable and elaborate communication upon the subject of the utilisation of sewage; and that the same be ornamentally written on vellum, framed and glazed, at an expense not exceeding twenty guineas, and transmitted to Baron Liebig."

JUSTICE TO SCOTLAND. In the House of Commons last week, Mr. Black asked the Lord Advocate whether the penalty which was incurable by the medical practitioners of Scotland under the 41st section of the Act 17th and 18th Victoria, cap. 80, was repealed by the 14th section of the Act 23rd and 24th Victoria, cap. 83; and, if not, whether he intended to take the necessary steps to procure a repeal of that enactment, and so place the medical practitioners in Scotland on a footing of equality with the medical practitioners in England and Ireland. The Lord Advocate said that the clause referred to had not been repealed, though the penalty had been considerably relaxed. He did not propose to introduce any measure on the subject.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY. At the annual meeting of this society, held on the 1st inst., the following officers and other members of the council were elected for 1865-66. *President:* James Alderson, M.D., F.R.S. *Vice-Presidents:* Frederick Weber, M.D.; William R. Basham, M.D.; Samuel A. Lane; John Simon, F.R.S. *Treasurers:* H. A. Pitman, M.D.; Spencer Smith. *Secretaries:* H. W. Fuller, M.D.; John Birkett. *Librarians:* A. P. Stewart, M.D.; Luther Holden. *Other Members of Council:* A. W. Barclay, M.D.; Edmund L. Birkett, M.D.; Stephen J. Goodfellow, M.D.; Edward Meyron, M.D.; Henry Oldham, M.D.; Oscar M. P. Clayton; Holmes Coote; George Critchett; Charles H. Moore; Alfred Poland.

HEALTH OF THE METROPOLIS. In the week that ended last Saturday, the births in London and nine other cities or boroughs of the United Kingdom were 4,330; the deaths 3,301. The annual rate of mortality in the week in those ten large towns was 31 per 1,000 persons living, and less than in the previous year, when it was 32. The number of deaths in London, returned for the week, was 1,590. The actual return is in excess of the estimated number by 85. The mortality from scarlatina was less than it had been in many previous weeks; the deaths were 34. Typhus, which also shows a decline, was fatal in 69 cases. Phthisis was fatal in 165 cases, bronchitis in 242, pneumonia in 83, and heart-disease in 80 cases. Four persons were killed by horse conveyances. Sixty-seven persons died at the age of 80 years and upwards, 2 of whom were women who had attained the age of 94 years.

MEDICAL ETHICS IN AMERICA. A correspondent of the *Philadelphia Medical and Surgical Reporter*, in an article on the "points of contact in the boundary line between the legitimate profession of medicine and

quackery," laments that there are in America some who fail to observe this line of demarcation. One could, he says, be led to pity and forgive a poor young practitioner who might be tempted to sell his professional rights for a mess of pottage; but when those of mature years and in affluent circumstances descend from their sublime position to practise the "hoens poens" healing art, they become most worthy of derision. Even in New York and Brooklyn, where medical men are blessed with every privilege which could enable them to maintain their professional dignity and honour, there are those to be found who have dared to sow tares among the wheat. The violation of professional etiquette is the first step usually taken toward quackery. There are medical men who hold themselves ready not only to attend but to retain patients when their regular physician cannot be found, and assume charge of patients before the attending physician has been discharged or paid his bill, whenever such patients may desire a change. There is another trick practised in this locality—we hope it is unknown elsewhere—by some who are not blessed with the most admirable spirit. When they require counsel, or when those who employ them do so, they avoid calling in any member of the profession in their own city, lest it might be thought that any brother practitioner was possessed of skill superior or equal to their own. It appears that there are physicians in New York and Brooklyn who are in the habit of calling to their aid in treating their patients a New York gentleman whom we hardly think qualified to be a consulting physician or surgeon. This gentleman makes himself known in public as a practical manipulator and electrician, and professes to cure a vast number of infirmities by rubbing, pinching, squeezing, etc. He has, it appears, the power of giving new vitality to paralysed muscles, and of rubbing out sprains, palsies, gout, and rheumatism at the points of patients' toes and fingers; so wonderful is the efficacy of his touch. We understand that his treatment is particularly appropriate to the delicate sex, and the doctors, who are shocked at the thought of treating female diseases, send their sound lady patients to him to undergo his treatment. So imposing is the reputation of this man that some of the New York doctors send him many of their patients to be treated, and also have him to visit others at their own homes for the purpose of rubbing them up to the standard of health. As the doctors have now had considerable experience with the manipulator, they must be pretty well skilled in his system of practice, and we would expect to see them rubbing out disease themselves; but as they have not, so far as we know, used the remedy, it would appear that they believe the manipulator has healing in his fingers. If these doctors are so far enslaved by the marvellous and superstitious as that, we would recommend them to give up the tedious study of science. They make very good candidates for a place in the ranks of clairvoyants and astrologists, and the members of the regular profession will, no doubt, excuse them for retiring from among them if they are so disposed. We sincerely hope, however, that these doctors are not past redemption, and that they may be led to see the depravity of their professional condition, and to turn from it to the path which belongs to every man of true science. They have it in their power to belong to the number of those whose highest ambition is to maintain the reputation of the medical profession. The profession of medicine in America is fast approaching to that high position which it has never attained in any other nation. We hope soon to see the day when the medical corps will be as jealous of their rights as they are now skilled in science; when the line of demarcation between the re-

gular profession and quackery will be as broad as that between christianity and infidelity, and even the lowest will be above all mercenary transgressions.

OPERATION DAYS AT THE HOSPITALS.

MONDAY.....Metropolitan Free, 2 P.M.—St. Mark's for Fistula and other Diseases of the Rectum, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.
TUESDAY.....Guy's, 1½ P.M.—Westminster, 2 P.M.—Royal London Ophthalmic, 11 A.M.
WEDNESDAY...St. Mary's, 1 P.M.—Middlesex, 1 P.M.—University College, 2 P.M.—London, 2 P.M.—Royal London Ophthalmic, 11 A.M.—St. Bartholomew's, 1.30 P.M.
THURSDAY.....St. George's, 1 P.M.—Central London Ophthalmic, 1 P.M.—Great Northern, 2 P.M.—London Surgical Home, 2 P.M.—Royal Orthopaedic, 2 P.M.—Royal London Ophthalmic, 11 A.M.
FRIDAY.....Westminster Ophthalmic, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.
SATURDAY.....St. Thomas's, 1 P.M.—St. Bartholomew's, 1.30 P.M.—King's College, 1.30 P.M.—Charing Cross, 2 P.M.—Lock, Clinical Demonstration and Operations, 1 P.M.—Royal Free, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.

MEETINGS OF SOCIETIES DURING THE NEXT WEEK.

MONDAY. Royal College of Surgeons of England, 4 P.M. Professor Huxley, "On the Structure and Classification of the Mammalia."—Epidemiological Society, 8 P.M. Dr. Smart, R.N., Deputy Inspector-General of Fleets and Hospitals, "On Diphtheria at Bermuda"; Dr. Swarbeck Hall, "On Vaccination in Tasmania"; Dr. Lawson, "On the Epidemiology of the Cape of Good Hope and Natal."—Medical Society of London, 8 P.M. General Meeting for the Election of Officers and Council. Dr. Sanson, "On Chloroform in Surgery."
TUESDAY. Pathological Society of London, 8 P.M.
WEDNESDAY. Royal College of Physicians, 5 P.M. Dr. Edward Smith. Gullstonian Lectures. "A Critical and Experimental Inquiry into our Knowledge of Urea in its Relation to Nutrition, Food, and other Physical Agencies in Health; and to certain States of Disease."—Royal College of Surgeons of England, 4 P.M. Professor Huxley, "On the Structure and Classification of the Mammalia."—Obstetrical Society of London, 8 P.M. Mr. Rowse, "Marks on the Neck of a New-born Child"; Mr. A. Harris, "Membrane Expelled Some Days before Labour"; Dr. Meadlow, "Remarks on a Case of Monstrosity."—Medical Society of London, 8 P.M. Anniversary.
FRIDAY. Royal College of Physicians, 5 P.M. Dr. Edward Smith. Gullstonian Lectures. "A Critical and Experimental Inquiry into our Knowledge of Urea in its Relation to Nutrition, Food, and other Physical Agencies in Health; and to certain States of Disease."—Royal College of Surgeons of England, 4 P.M. Professor Huxley, "On the Structure and Classification of the Mammalia."

REGISTRATION OF DISEASE.

MONTHLY RETURN of new cases of disease coming under treatment at Pauper and Public Institutions. (A.) Manchester and Salford (Sanitary Association). (B.) Preston (R. C. Brown, Esq.). (C.) St. Marylebone, London (Dr. Whitmore).

4 weeks ending January 28, 1865.

TO CORRESPONDENTS.

* * All letters and communications for the JOURNAL, to be addressed to the EDITOR, 37, Great Queen St., Lincoln's Inn Fields, W.C.

COMMUNICATIONS.—To prevent a not uncommon misconception, we beg to inform our correspondents that, as a rule, all communications which are not returned to their authors, are retained for publication.

CORRESPONDENTS, who wish notice to be taken of their communications, should authenticate them with their names—of course, not necessarily for publication.

W. D. M.'s very clever verses are, we fear, hardly suited for our JOURNAL.

L.—We should say that it is undoubtedly libellous to publish an untrue statement, to the effect that a surgeon operated in a case, in which he knew recovery was impossible, for the sake of the fee. Any man who so acted would, in the opinion of the profession, be regarded as little better than a cold-blooded villain.

F. O.—The case of accidental poisonings at Quebec, lately recorded in the journals, was said at the time to have been caused by tincture of digitalis. But we find from a paper in the *Canada Medical Journal*, that death was probably caused by tincture of aconite. We are not surprised that our correspondent should have noticed the discrepancy. Certainly, very large doses of digitalis have been administered in delirium tremens without producing poisonous symptoms—a fact which renders it probable, that in Montreal the deaths were not caused by digitalis, as stated in the papers.

THE WOODHALL AND ASHBY SPAS.—SIR: Mr. Jackson will find an account of the latter spa in *A Descriptive and Historical Guide to Ashby-de-la-Zouch*, etc., published in 1831. The analysis given in that work shews the springs to contain muriates of lime, soda, and magnesia sulphates of lime and soda; and carbonates of lime and iron; also bromine. Mr. Thos. Kirkland would probably, if applied to, give information on this subject. More recent and fuller information regarding this spring, as well as that of Woodhall, will be found in Dr. R. M. Glover's work on *Mineral Waters*, pp. 119-21. See also Dr. Althaus' *Spas of Europe*, p. 131, for the Ashby-de-la-Zouch spring. The Woodhall spring is not noticed by the latter author. I am, etc., R. W. FALCONER, M.D.

Bath, February 27th, 1865.

DR. EDMUNDS AND CORONERS' INQUESTS.—SIR: As an attack has been made upon Dr. James Edmunds' manner of giving evidence at coroners' inquests, where the reputation of medical men have been concerned, I think it no more than just that every one who has experienced very opposite and gentlemanly behaviour from Dr. Edmunds, should at the present time come forward and express the same.

I must therefore state that, some months ago, I had been attending a child, who died; when some dispute arose between the grandmother of the child (who had the care of it) and a neighbour, who declared the grandmother had poisoned the child. An inquest was demanded, and obtained; Mr. Humphreys ordering Dr. Edmunds to perform the *post mortem* examination. Dr. Edmunds wrote to me, in a very polite and gentlemanly manner, to attend the *post mortem* examination, which I did; and when he found I had not been summoned to attend the inquest, was instrumental in my being so.

I am not aware that Dr. Edmunds had any previous knowledge of me. I am, etc., R. H. LEIGH, L.S.A.

59, Barbican, City, Feb. 28th, 1865.

COMMUNICATIONS have been received from:—Mr. AUGUSTIN PRICHARD; Mr. A. R. STEELE; Dr. W. H. O. SANKEY; Dr. THOMAS SKINNER; Dr. RADFORD; Dr. DURANT; THE REGISTRAR OF THE MEDICAL COUNCIL; Dr. S. H. STEEL; Mr. H. LOWNDES; THE HONORARY SECRETARY OF THE EPIDEMIOLOGICAL SOCIETY; Dr. R. W. FALCONER; Dr. DOBELL; Dr. T. H. JACKSON; Mr. D. KENT JONES; Mr. J. WALTER; Dr. WILKS; Mr. A. G. ROPER; Dr. W. H. MURPHY; Dr. FITZPATRICK; Mr. CURRIEVEN; Dr. GEORGE JOHNSON; Dr. RICHARDSON; Mr. R. H. LEIGH; THE HONORARY SECRETARY OF THE OBSTETRICAL SOCIETY; Dr. SCHOLFIELD; Mr. R. L. BOWLES; THE REGISTRAR OF THE MEDICAL SOCIETY OF LONDON; and Mr. STONE.

Observations

ON THE

CÆSAREAN SECTION AND ON OTHER OBSTETRIC OPERATIONS.

BY

THOMAS RADFORD, M.D.,

F.R.C.P. EDIN. AND F.R.C.S. ENG., ETC.,

HONORARY CONSULTING PHYSICIAN TO ST. MARY'S HOSPITAL,
MANCHESTER.

CHAPTER III.

On the Maternal and Infantile Mortality.

HAVING, in the preceding chapter, placed before my readers a full and trustworthy statistical account of the results of the Cæsarean section in the cases in which this operation has been performed in Great Britain and Ireland, I shall next endeavour to prove what the causes are which have occasioned such a fearful fatality of the mothers, and how far they unavoidably belong to the operation. I shall then speak of the infantile deaths and their causes.

To satisfactorily and faithfully accomplish this investigation, the mind ought to be free from all partiality in favour of the Cæsarean section and from all prejudice against it. The deductions on which we seek to establish practical principles ought, as far as possible, to be drawn from well established facts. However true this rule in general is, there is more or less difficulty in strictly observing it on the subject now under our consideration. Most of the cases, in my humble judgment, have been related more for the object of swelling the already fatal list, than for the purpose of pointing out the mischief which existed previously to the operation, and the real causes of death.

I.—*On the Causes of Maternal Mortality.* The constitutional state of most of the women who underwent this operation, was very unfavourable for its performance. Forty-five of them laboured under progressive and incurable disease; many of them were bedridden, and were also unable to discharge their social duties. Many others wanted that perfect or conservative constitutional power to enable them to bear without danger so important an operation.

In most of these cases, the practitioner was ignorant of their nature until his assistance was required during labour, and therefore he could not adopt preparatory measures. In all capital operations, the risk is greatly enhanced if such means have been neglected. The blood must be depraved in such subjects, and consequently the secretions and excretions must be unhealthy; hence the necessity of taking such steps as tend to correct organic or functional derangement. Constipation is nearly an invariable attendant on ordinary pregnancy; and, in many cases, fecal accumulations to a great amount occur. But when distortion of the pelvis exists, this is much more likely to happen, in consequence of the mechanical impediment offered by the great projection of the promontory of the sacrum and lower lumbar vertebrae to the downward passage of the fæces. The cervical and oral portions of the uterus, which are thrown backwards against this osseous

mass, tend to compress the intervening gut. The same effects, to a greater or less degree, are produced when large tumours exist in the pelvis. The numerous evils which arise from neglected bowels are not only experienced during pregnancy, but also during the puerperal state. Such are peritoneal inflammation, puerperal irritation and exhaustion, etc. If, then, such serious diseases occur during the puerperal state after ordinary labours, from causes which are remediable, is it not very probable that the same mischief might happen after Cæsarean cases, in which these causes do exist in a still higher degree?

Labour, if unduly protracted, is nearly always attended and followed by a considerable number of very serious evils.

These mischievous effects vary considerably according to the duration of the labour—to the nature of the cause and the degree of the mechanical impediment which obstructs the passage of the child through the pelvis. And, therefore, it is obvious, different measures must be adopted according to the relative degree of obstruction. We ought, however, always to consider a lengthened duration of labour, from whatever cause it arises, as more or less unfavourable to both the mother and her infant. In all such cases, we should be extremely watchful, and timely adopt those measures relatively required for the delivery of the woman before any injury is inflicted on, or irreparable mischief is done to, the pelvic tissues or organs. It must be understood, that all the dangers of protraction increase after the rupture of the membranes and the discharge of the liquor amnii. It is also a well established fact, that the dangers both to the mother and to the infant increase in a ratio proportionate to the duration of labour. I soon learned, from my hospital practice, that the rules laid down by systematic writers on midwifery, on the treatment of protracted labour, were most mischievous.

To the students of my class, I invariably and urgently inculcated the necessity of an early performance of all obstetric operations, either manual or instrumental, as being of the highest importance, and as especially tending to save the lives of both mother and infant when those instruments were used which are compatible with its life.

In the year 1843, I delivered a short course of lectures to many members of our profession, in which I urged the propriety of an early performance of all obstetric operations, especially of the Cæsarean section; and pointed out the progressive dangers of protraction. At this time, I had no tables to guide my opinion, with the exception of those of Dr. Breen in his observations on the management of tedious labour. (*Edin. Med. and Surg. Journal*, vol. xv. p. 161.) These tables clearly show that dangers increase with the duration of labour. Since this period, Professor Simpson has most satisfactorily proved this fact. It may not, perhaps, be considered irrelevant briefly to mention the effects of labour when unduly and unwarrantably prolonged, in order that a comparison may be made between them and those which have been found existing after the Cæsarean section, and which have been most unjustly attributed to this operation.

Sometimes febrile excitement occurs, accompanied with a quick pulse, hot skin, great thirst, and furred tongue. If means of relief be not afforded, more alarming symptoms soon follow. The tongue be-

comes covered with sordes; the pulse becomes more feeble; and sinking and exhaustion take place, followed by death. Apoplexy, or hæmorrhage from the lungs, may occur in women predisposed to these diseases; or the large vessels of the heart may suffer. Atony of the uterus happens, giving rise to flooding. Active or sudden rupture of the uterus frequently happens. There often takes place a destruction of tissue in the cervix uteri, from the contusion which this part sustains by the forcible pressure of the child's head against the pelvic bones. The os uteri is sometimes separated from the cervix. In other cases, gangrene of the cervix and os has taken place. Inflammation of the cellular tissue of the pelvis occurs, with its consequent infiltration, suppuration, and abscess. At other times, the textures of the different pelvic organs are destroyed, and sloughing takes place, which makes intercommunications between the vagina and the rectum, or between the vagina and the bladder, constituting recto-vaginal or vesico-vaginal fistula, with a train of evils which make the life of the woman most miserable.

The nervous system may be considerably influenced by the Cæsaean section, as it is by most, if not all, other capital operations, the effect of which is termed "shock". This has been asserted to be a frequent, an unavoidable, and an uncontrollable cause of the woman's death. If an abstract view only be taken of the condition of the patient after the operation, then this statement would in some measure appear to be true. But a careful consideration of all the preceding contingent circumstances which existed in each of the recorded cases, and more especially of those which have occurred to myself, leads me to a different conclusion. All the patients, in whose cases I have been concerned, bore the operation with great fortitude and moral courage; and some of them expressed themselves as having endured less pain than they had felt from one of the labour-throes. There was not any manifestation of shock produced by the operation, which did not exist before its performance. If women who had not been endangered by previous disease, or who had not suffered from the effects of protracted labour, died suddenly, or in a few hours, after this operation, without any rally, then it would be reasonable—nay, quite right—to attribute their deaths to the shock occasioned by it. But the fact is otherwise, as nearly all those patients registered in the tables laboured under an incurable disease, and had been a considerable time in labour. I here insert the durations of the labours in sixteen of the tabulated cases, in which sinking, exhaustion, or the effects of shock, are stated as the real cause of death. In one, it was twelve days; in one, it was ten days; in one, it was seven days; in one, it was six days; in one, it was four to five days (in this case, turning had been unsuccessfully attempted, and afterwards craniotomy ineffectually performed, during which operation the vagina was lacerated); in one, it was a hundred and two hours; in one case, it was three days and a half; in three cases, it was three days (one of these women died from disease of the lungs); in one, it was sixty to seventy hours; in one, it was sixty hours; in one, it was thirty-six to forty hours; in one, it was thirty-five hours; in one, it was thirty-four hours; in one, it was twenty hours. One was only twelve hours in labour. She was greatly reduced in vital power by unavoidable hæmorrhage (placenta prævia); she had also bronchitis and epi-

leptic convulsions both before and after the operation.

These cases require no further comment, than to say they afford sufficient evidence of the real cause of death, which truly cannot be attributed to the operation.

Hæmorrhage with shock is stated to have been the cause of death in some of the tabulated cases. The duration of labour in these women is noted as follows. In one, it was fifty-four hours; in one, fifty-five hours; in one, fifty-six hours; in one, seventy-two hours; in one, thirty hours. In this case, there had been a considerable loss of blood before the operation; but very little was lost afterwards. Embryotomy had been unsuccessfully performed, the uterus ruptured, and the os separated from the cervix uteri. In one case, the labour lasted eighteen hours. There was very little blood lost during the operation; but internal hæmorrhage afterwards took place. There were three pints of blood found.

Hæmorrhage has been alleged to be one of the causes of the fatality of this operation. Dr. Hull, however, in two or three parts of his controversial writings, denies that serious danger occurs from this cause; but a strict analytical inquiry of the tabulated cases proves that this assertion is not correct, but that a greater or less quantity of blood is sometimes lost. In several instances, the discharge was considerable, and perhaps may be said to have been dangerous. The peculiar sources whence blood issues during this operation are from the incised edges of the abdominal and uterine parietes; and, when the placenta is in the way of the incision, it may be cut, and then blood issues from its divided structure. Hæmorrhage sometimes proceeds from the uterine arteries, and from the large sinous openings, and also from the surface of the placenta when it is partially separated; and, when this organ is torn, blood is discharged from its disrupted textures, as happens after ordinary labour. In the seventy-seven cases, it is recorded that in twenty there was no blood lost; in twenty-four, very little was discharged, varying from two to seven ounces in quantity; in five cases, there were seven to ten or twelve ounces; in four cases, there were fourteen to twenty-four ounces discharged. In twelve cases, the extent of loss is not definitely stated; but the following expressions are used, as "very considerable," "profuse," "a gush," "really frightful," "not alarming," "great and welled up." These statements are so vague as to be completely valueless, and cannot enable us to judge whether the patients were really endangered by it. We know too well what varying accounts are given by different persons as to the quantity of blood lost on ordinary occasions, to receive the above terms as evidence of a positively serious loss. It is very probable that the amount of blood lost in most of these cases did not exceed that which is discharged after ordinary labours.

In four of the cases, chloroform was administered; and in one, etherisation was used before and during the operation.

In twelve cases, the placenta was cut upon; in one of which there were twenty to twenty-four ounces of blood lost; in one, fourteen to sixteen ounces; in one, ten to twelve ounces; in two, a considerable quantity was lost; and in seven or eight, the quantity was very trifling.

In two cases, the epigastric artery was divided; but there was little bleeding, and it was readily stopped.

In seven cases, the blood issued from the uterine tissue during the incision.

It has been asserted that these accidents (in Cæsa-rean cases) depend on causes which are not very much within obstetric control. This statement is, however, very far from true. In the majority, the sources whence the blood flows are, as has already been mentioned, the same as those whence it issues in other cases of flooding.

The complete contraction of the uterus must, if possible, be obtained: and the placenta must be promptly removed. The latter part of this rule can always be easily and effectually carried out; but there is more difficulty to fulfil the former part of it, as the contractility of the organ is considerably impaired. This is a common effect after protracted labour. In most of the Cæsa-rean cases, the operation was not performed until the power of the uterus was completely worn out; and in many cases its tissue was disorganised. The relative and comparative tolerance of the loss of blood in such cases should be duly considered: and as far as possible this accident should be guarded against. It is not, however, true that "the resources of art can effect but little," or to look upon it as a certain contingency upon the operation.

The vital powers of most of those women who underwent the Cæsa-rean section were at a very low ebb previously to the commencement of labour, and were further seriously exhausted by its duration.

Inflammation of the peritoneum is considered as a frequent cause of death after the Cæsa-rean section. This serous membrane is usually more susceptible to morbid disturbance after labour than it is at ordinary times: so that it cannot be wondered at, that this disease is sometimes found in Cæsa-rean cases, especially if the previous management of the labours, and the real condition of the patients at the time of the operation, are duly considered. The duration of the labours of the women who had peritonitis is as follows. In one, it was six days; in one, three days; in one, sixty-one hours; in one, sixty hours; in one, fifty-three hours; in one, fifty-two hours; in one, forty-eight hours; in one, forty hours; in one, thirty-eight hours (craniotomy was unsuccessfully performed in this case); in one, thirty hours (turning was unsuccessfully attempted, and craniotomy was afterwards ineffectually performed); in one, eighty-two hours (attempts were unsuccessfully made, the membranes being ruptured, to induce premature labour; and afterwards craniotomy was performed without success). Other periods are to be noted—twenty-four, twenty-nine hours, etc.; and in one the labour lasted only thirteen hours, but in this case the uterus was stitched with the Glover's suture. In one woman, the duration of her labour was fifty-four hours; she had flooding before the operation. In another woman, whose labour lasted ten days, it is stated that she had peritoneal inflammation, in conjunction with the effect of shock.

In two or three cases, the lower portion of the cervix and the os uteri were gangrenous. The violent and constant pressure of these portions of the uterus betwixt the head of the infant and the irregular projection of the distorted pelvis cannot be unlimitedly continued without producing

either laceration or disorganisation, or complete destruction, of their tissue.

It is alleged that the abdominal and uterine wounds have been found in very different states, most of which are said to have shown a feeble reparative power and a perverted action.

When the vital powers are good in cases of an operation, we have conservative and restorative action immediately set up; but, if they are impaired by the existence of positive disease, or by protracted labour, unhealthy action takes place: and, instead of healthy surfaces, flabby and oedematous edges of the wound are seen; and, instead of an adhesive effusion, there is a dirty sanious discharge, and the uterine wound is said to be found generally gaping. Although remarks on the bad state of the wounds are made to depreciate the value of the Cæsa-rean section, yet it cannot be a matter of surprise that they should sometimes present such very unhealthy aspects, if the previous constitutional and local condition of nearly all the women upon whom it has been performed be justly considered.

Another cause of danger is supposed to be the reduction which goes on in the puerperal uterus, so as to regain its pristine size. This change is considered antagonistic to the reparative action necessary to heal the wound made in the Cæsa-rean section.

The entire vascular system of the puerperal uterus is very considerably altered: and the supply of blood to it is consequently very much lessened from that which existed during its gravid state. This change, together with a process of absorption which is now set up, at least partly causes its diminution of size. But this organ may be, as it is stated, reduced in bulk by a general degradation of its tissue: of which the abundant presence of fat-globules in the lochial discharge, and in the *débris* which covers the interior of the organ, is ample evidence. These are natural changes, and not pathological; and, if there be a reduction of bulk in the uterus, there is simultaneously a relative diminution in the size of the wound. It has yet to be proved whether the alteration which the puerperal uterus naturally undergoes will in any way interfere with the process of reparation.

The want of union of the edges of the uterine wound by adhesion or by granulation is traceable to causes which have already been frequently mentioned, rather than to the natural organic changes above stated.

Tetanus has been considered a cause of maternal death after the Cæsa-rean operation: but I am not aware that this disease is so recorded in any of the tabulated cases. Professor Dubois told me that a patient of his had an attack of this disease in two or three weeks after the operation, and it proved fatal. This disease, it is said, occurs after other obstetric operations; and it sometimes occurs after abortion.

The bursting open of the wound becomes a cause of danger, by allowing the protrusion of the intestines. The attenuated state of the abdominal parietes, which sometimes exists in extreme cases of *mollities ossium*, occasions this accident. It happened in three cases, in which no attempts were made either to replace the protruded bowels, or to approximate the retracted integuments. This, however, was a great omission. As an example of the necessity and propriety of returning the intestines, if they unfortunately escape through the wound, I refer to the

case (one of recovery) of Mrs. Sankey. (See *Lond. Med. Gazette*, vol. xlvii, p. 804.)

Frequent examinations *per vaginam* are often productive of very serious mischief. Inflammation, followed by suppuration and sloughing, are not unusual results. Two or three examples will be found reported, in which great tumefaction of the external genitals and an inflamed state of the vagina existed. These results are alone attributable to frequent and unwarrantable interference.

Long and ineffectual attempts to deliver by the perforator and crotchet are highly dangerous. Contusion, lacerations, inflammation, infiltration, suppuration, and sloughing, are consequences which are not unusually to be found in cases in which violent efforts have been made to drag a mangled infant through a contracted pelvis.

II.—*On the Causes of Infantile Mortality.* The fœtus *in utero* sometimes dies from diseases which occur in its own system, and also from morbid changes in the structure of the placenta, which interrupts the supply of blood from this organ. These causes are not, however, confined in their operation to any particular class of cases. The duration of labour exercises very great influence upon the infant. If the membranes remain entire, and the liquor amnii undischarged, it will endure the continuance and violence of the labour-pains for a considerable length of time without injury. But after this event has happened, there is much more risk of mischief; and the danger increases in a ratio proportioned to the length of time the labour is protracted. The deaths of the infants which have occurred in Cæsarean cases are generally to be attributed to the long continued and violent pressure which they have endured during labour.

There is, however, another cause of infantile death which more especially belongs to the Cæsarean section. I mean the spasmodic seizure of the neck or body of the infant during its extraction through the incised opening of the uterus. In general, there is no difficulty experienced in these cases in withdrawing the infant from the uterus; but sometimes some portion of its body becomes so firmly grasped by the uterus in its passage through the incised opening that great difficulty is experienced in extracting it. There is, however, more danger to the infant when the neck is seized by the uterine grasp than when it is held by any other part of its body. In such cases the body of the infant has been most easily brought along until the shoulder had passed, when the neck is instantaneously seized, and so firmly held, as to require long and continued efforts to be made in order to extricate the head.

The fact, that the uterus in natural labour is energetically roused to expel the placenta which has been separated, first led me to attribute the seizure of the neck of the child during the Cæsarean section to the partial or complete detachment of the placenta. It has lately been doubted whether this theory will suffice to explain it, as "numerous instances are recorded in which the placenta either protruded through the incision, or was found lying loose in the uterine cavity, and in which no inordinate contraction ensued." I am, and was from the first, aware of the truth of this assertion, from an accurate analysis and tabulation of all the published cases; but, notwithstanding the apparent force of this objection, my opinion remains the same.

There are seven cases (two within my own knowledge) in which this event happened; and, as far as I can ascertain, the placenta has been partially or entirely detached in all these cases, or at least presumptively so.

How far the violent uterine action may resemble the spasm of hour-glass contraction, I cannot determine; yet analogy would lead me to think it did.

There is only recorded one (another case) in which the infant was grasped round the abdomen above the hips; the head, shoulders, and trunk, having been first drawn forth. The child was previously dead; and the only effect recognised was the squeezing out the meconium into the uterine cavity. Turning had been unsuccessfully attempted; and during this operation, it was found that there was hour-glass contraction. Does not the occurrence of hour-glass contraction before, and seizure of the child's hips after, the operation, favour the above mentioned opinion?

Clinical Lecture

ON

THE GERMS AND VESTIGES OF RHEUMATIC FEVER.

Delivered at the Royal Infirmary for Diseases of the Chest.

BY

HORACE DOBELL, M.D.,

PHYSICIAN TO THE INFIRMARY.

I PROPOSE to-day, gentlemen, to bring before you two classes of cases, specimens of which are always under treatment at this hospital.

In one, we see the most formidable effects of disease, damaging and incapacitating vital organs; in the other, a few marked symptoms of functional disturbance, producing temporary pain or discomfort. At first sight, there does not seem to be any connexion between the two; but I shall endeavour to show you that they are, in truth, but episodes in a continuous story, although often widely separated by time and circumstance.

The detailed notes of all the cases are on the table. The first case is that of G. T., aged 33, case-maker, admitted a fortnight ago, complaining of great oppression and tightness across the front of the chest, much increased by exercise; occasional vertigo and cold sweats; distressing palpitation, and short cough; quite unable to follow his work. He had old standing valvular disease, the vestiges of rheumatic fever fourteen years ago, from which he had suffered no particular inconvenience until he engaged in a day's rowing a week before admission; but this undue exertion had put his life in peril. Treatment directed to the relief of his oppressed thoracic circulation, and complete rest, have in fourteen days removed all his painful symptoms, and he is able to resume his occupation.

The next case is that of G. H., aged 40, a lithographic pressman, who was admitted for the first time two years ago, in a condition very similar to that of the last man (G. T.), and discharged in a few weeks with similar satisfactory relief. He was cautioned that, if he continued to follow the same laborious occupation, it would eventually kill him. This caution he

recklessly disregarded; and you will see by the notes that he has, in consequence, returned to this hospital every few months, each time worse than before, and each time obtaining less complete relief, as his organs have become more and more damaged. He is now, as you have seen, in a most perilous condition, and will never again be able to return to work. When first admitted, he had disease of the aortic and mitral valves, the vestiges of rheumatic fever. Now, the incompetence of the valves is more marked than before; and he has also great dilatation of the heart, retrograde congestion of all his vital organs, pneumonia of the left lung, considerable anasarca and albuminuria, and he is much exhausted.

These two cases, which are only examples of the class of which we see such numbers at this infirmary, serve well to illustrate the valvular damages which may result from rheumatic fever; the sort of complications which may follow the valvular disease; the striking and pleasing relief which can often be obtained by simple rational treatment; the great influence of habits and occupation upon the course of the disease; and they show how absolutely necessary it is that these should be strictly regulated, if we wish for any permanence in the relief obtained by treatment. But I have introduced them now for the purpose of reminding you of the grave importance which we must always attach to these vestiges of rheumatic fever.

It is to the next class of cases that I wish to direct your more especial attention to-day. They are so numerous here, that we are apt to get tired of them. They appear so simple, and, as a rule, are so easily relieved by a little regulation of the diet and a few weeks' medicines, that I do not wonder if you have considered them utterly devoid of interest or importance. A long course of clinical observation, however, has taught me to regard them in a very different light; and I wish to bring them before you to-day in an aspect and relationship which, I hope, will quite alter your ideas of their import, and give them a peculiar interest—an interest such as we attach to a commonplace-looking egg, so soon as we discover that, instead of being that of a bird, it may be developed into a python.

I refer to the cases which every day you see me mark with the letters "A. D.," to signify acid dyspepsia. A very simple group of symptoms, monotonously similar in most of the cases, serves for a correct diagnosis.

1. Pain at the epigastrium, coming on within an hour after food, generally within half an hour, very often within a few minutes, especially excited or aggravated by cheese or malt liquor.

2. Urine very acid, of high specific gravity, high coloured, and depositing urates on cooling, and uric acid crystals after standing some time; often suddenly changing to limpid and low specific gravity, but quickly returning to the other condition.

3. Tongue red at the tip, with elevated papillæ; often red at the edges also.

4. Appetite usually good, often very good, especially for animal food.

5. Epigastrium tender on pressure.

Such are the features of the majority of the cases, of course complicated and modified by the existence of other diseases, the habits of the patients, etc.

The most marked of these is the time at which pain begins after food: it is very soon after. Sometimes we find an old neglected case in which the pain comes on later, even an hour and a half, or, rarely, two hours after food; but, if it be a case of acid dyspepsia, you will find, on close inquiry, that when the symptoms first set in, the pain was directly after eating; and that the time of its onset

has become later and later. In these cases, too, the appetite will be bad, instead of good; and the food will often be vomited. They are, in fact, exceptional cases, in which the digestive power has become paralysed by the neglect of the original disease. With these exceptions, if the pain does not begin till more than one hour after eating, the case is not one of acid dyspepsia. To demonstrate these exceptions, I may mention to you Case 64,297, domestic servant. She complained of pain in the pit of the stomach, beginning from one to two hours after food, with much flatulence; but said that when it began, five weeks before admission, it came on much sooner after food; and as the complaint yielded to treatment, the pain came on sooner and sooner after food, till it ceased to come at all. In Case 64,525, the food was brought up undigested; and in Case 64,207, there was no appetite and no taste for food on admission; but when the complaint began, two months before, the appetite was very good.

So much, then, for the symptoms of this complaint. The next point is as simple and as striking as the symptoms; viz., that the cases almost invariably get well in a few weeks under a very simple plan of treatment.

1. We order them to take out-of-door exercise, and to attend to the condition of the skin.

2. We forbid them to take malt liquor or cheese, and allow whisky or brandy instead; and advise water to be drunk freely.

3. We neutralise the secretions by soda and potass in full doses, with lemon-juice or citric acid; then follow this with an alkaline stomachic powder of soda, potass, ginger and calumba before meals; and, if the patient be weak, give iron and quinine to finish. Sometimes we have to put a very small blister over the pit of the stomach, but not often. This alkaline plan of treatment must be thoroughly carried out; and it is surprising what large quantities of alkali are often required. If you find the symptoms obstinate, you will be sure to find that the secretions are still too acid: they must be completely neutralised at the onset; and then you will quickly find the tongue lose its red tip and edges, and there will be no more pain after food. This feature in the treatment brings me to the point upon which all the interest turns—the link which connects these common cases of acid dyspepsia with the cases of disease of the heart.

It lies in the fact that this acid dyspepsia is a symptom of a rheumatic state of the system. If you inquire into these cases carefully, you will discover in the majority a rheumatic history. You will find that they belong to rheumatic families, or that they have themselves been the subjects of rheumatic affections. This fact is illustrated by many cases now under treatment.

Case 64,035 had rheumatism two years ago.

Case 64,207 had frequently suffered from rheumatism.

Case 64,525 had been subject to rheumatism in the limbs.

Case 62,690 had rheumatic fever six years ago.

Case 61,827 had acid dyspepsia three years ago, and pleurisy and rheumatism at this hospital two years ago.

Case 64,297 had rheumatic fever badly thirty years ago, and slightly since.

Case 62,635 has had rheumatic fever every two or three years for eighteen years.

A patient admitted this morning with acute acid dyspepsia never had any rheumatic affection; but her parents and nearly all her brothers and sisters were rheumatic. One brother and her father had had rheumatic fever.

And these are only examples of what I shall be

able daily to point out to you, as fresh cases come before us.

There is every reason to believe that the acid, which is found in such quantities in the stomachs of these patients, is either identical with or closely allied to the *materies morbi* of rheumatism—the acid which must exist in excess in the organism before a person can have rheumatic fever.

Whether it is first generated in, or poured into, the digestive tract, and afterwards absorbed into the blood, may be open to question; but, whatever be the exact order of events, it is quite certain, from clinical observation, that it appears in the stomach very early in its career of mischief, and there gives rise to the symptoms of acid dyspepsia, which may, therefore, be taken as an important signal for alarm, never to be disregarded. It shows that the enemy is collecting his forces for an attack.

For this reason, as you may have observed, I seldom discharge patients who have been under treatment for acid dyspepsia without giving them directions for their future management, and the prescriptions of their alkaline medicines to be resorted to whenever they find the symptoms of their complaint returning. By adopting this plan, I have known many persons keep free from rheumatic fever and rheumatism for years, who previously had been subject to periodic attacks at short intervals.

If you inquire into the histories of persons who are subject to rheumatic fever, you will find, as a general rule, that they frequently suffer from acid dyspepsia; and, if you inquire into the histories of persons subject to acid dyspepsia, you will generally be able to make out either that they have suffered from some rheumatic affections, or that they belong to rheumatic families. In these two sets of cases, then, which are so numerous at this infirmary, we see the two ends of a long and sad story. So far as I am aware, the connexion between them has never before been specially pointed out; but I believe that I cannot too strongly impress upon you the importance of bearing in mind, when you get into practice, the fact that acid dyspepsia and valvular disease of the heart are to be regarded as the germs and vestiges of rheumatic fever; and that, if you keep in check the acid dyspepsia, you will not have the rheumatic fever; and that thus you may prevent the occurrence of the valvular disease.

A CONVENT CHANGED INTO A LABORATORY. We have, in the *Moniteur Scientifique*, the announcement of a grand chemical school which Signor Cassola has opened at Naples. He has hired a large convent and turned it into a laboratory. Italy did much for alchemy, the great grandfather of chemistry, and monasteries were the homes of science in the middle ages. Let us hope, then, that Signor Cassola's establishment will flourish and produce abundant fruits.

SPONTANEOUS GENERATION. The commission appointed to review the experiments of M. Pasteur and his opponents, MM. Pouchet, and others, relative to "*Spontaneous Generation*", report entirely in favour of M. Pasteur, and therefore oppose spontaneous generation. The report establishes that fermentable liquors may remain either in contact with confined air, or exposed to air which is often renewed without changing; and that if changes do take place, and organic beings are generated, this result cannot be attributed to the gaseous elements, but must be caused by solid particles introduced with air, and of which it may be completely deprived. Some of the experiments were objected to by the supporters of heterogenesis, and the commission will make further researches when warmer weather arrives. (*Chem. News.*)

HOSPITAL PRACTICE:

METROPOLITAN AND PROVINCIAL.

SAMARITAN HOSPITAL.

ACUTE TRAUMATIC PERITONITIS: VENESECTION: RECOVERY.

Under the care of T. SPENCER WELLS, Esq.

THE following case is a very striking confirmation of the truth of the principles advocated by Dr. Markham in a lecture on Blood-letting in Inflammation, published at page 107 of our present volume.

A housemaid, single, 22 years of age, the subject of a tumour of the right ovary, was submitted to operation by Mr. Spencer Wells on Feb. 6th, 1865. The cyst was exposed by an incision five inches long, and was tapped and emptied; but the pelvic connections were so intimate that Mr. Wells made no attempt to separate them or to remove the sac, but closed the wound at once, uniting the trocar-opening in the cyst to the abdominal wall by a hare-lip pin, as bleeding was very free from the vessels in the cyst-wall. A very acute attack of peritonitis came on. In less than six hours after operation, the pulse was up to 120, the respirations to 48; the skin very hot, the lips dry, the tongue parched, and thirst excessive. But, as the aspect and voice were both good, Mr. Wells waited two hours longer; hoping that free perspiration might come on, and give relief. But, eight hours after operation, there being even greater heat of skin, the pulse 136, respirations 52, and vomiting had begun, he took ten ounces of blood rapidly from the arm in a full stream. In half an hour, the pulse fell to 124, the respirations to 48, and the pulse became fuller, though it remained incompressible. In another hour, though the pulse remained at 124, the respirations sank to 40, and she vomited for the last time. The next morning, eighteen hours after operation, the pulse was 120, respirations 28; the skin hot, but perspiring. There was much thirst; and the tongue was quite dry all day, but it became moist towards night; and the pulse had sunk to 104, and the respirations to 30. After this, there was nothing further to note beyond gradual convalescence. As she had only two small opiates in the first thirty-six hours after operation, the venesection alone seems entitled to the credit of cutting short a very acute attack of traumatic peritonitis. Probably no other remedy could have had anything like such an effect.

We need say nothing at present as to the treatment of the ovarian cyst; as it will depend upon circumstances, whether Mr. Wells will wait until the tumour in growing elongates its pedicle, or whether it may be desirable to inject iodine, or to insert a drainage-tube.

LEEDS GENERAL INFIRMARY.

STATISTICAL TABLES OF THE OPERATIONS PERFORMED FROM JANUARY TO JUNE, 1864, INCLUSIVE.

[Concluded from page 169.]

Amputations of Arm for Accident.

No.	Sex and age.	Operator.	Nature of operation.	Stay in Hospital after operation.	Result.	Remarks.
1	M. 21	Mr. Smith	Circular.	17 days	Death from pyæmia.	The entire integument was stripped off the lower half of the left arm and the upper third of the forearm, and the remaining soft tissues were severely bruised.
2	M. 16	Mr. Teale	Rectangular.	6 days	Death from exhaustion consequent on gangrene of the stump.	This was a secondary amputation through the middle of the arm, performed fifteen days after a severe crush of the right elbow, in consequence of the forearm having become gangrenous. A line of demarcation had formed immediately below the elbow. The stump was attacked by gangrenous inflammation, which rapidly extended as high as the trunk.
3	M. 36	Mr. Nunneley	Circular.	18 days	Death from acute pneumonia and pleurisy.	The right forearm had been very severely crushed by a heavy stone falling upon it. As the injury to the soft parts extended considerably above the elbow, the amputation was performed above the middle of the arm. The stump became intensely inflamed a few days after the operation; the inflammation rapidly spread to the side of the trunk, where a large abscess formed, and pleurisy of the same side supervening, the man sank.
4	M. 44	Mr. Nunneley	Single flap.	18 days	Death from pyæmia and secondary hæmorrhage.	A stone, weighing 5 cwt., fell upon the right forearm, rendering it a mass of pulp, and severely crushing the soft parts about and immediately above the elbow. A long oval flap was taken from the inner side of the arm, and the humerus cut through about its middle. On the fifteenth day, symptoms of pyæmia were manifested; and on the day of his death, very free bleeding from the stump took place.
5	M. 9½	Mr. P. Teale	Circular.	25 days	Recovery.	The right arm was torn away by machinery at the elbow-joint, and the soft textures were lacerated to the extent of three or four inches above the elbow. Amputation, three inches below the shoulder-joint, was performed. The stump healed entirely by the first intention.
6	M. 39	Mr. S. Hey	Single flap.	49 days	Recovery.	This man's injuries were very severe, and were caused by his having been wound round a shaft in a mill. They were—compound fracture of left humerus at its middle, with protrusion of bone; compound fracture of left radius and ulna near the wrist, and protrusion of both bones; and fractures of the third or fourth upper left ribs. A large oval flap was taken from the outer side of the arm, and the humerus cut through immediately below the shoulder-joint. Most of the wound healed by the first intention, and the rest quickly by granulation. His recovery was without a drawback.

Amputation of Arm for Disease.

1	F. 34	Mr. Nunneley	Circular.	23 days	Death from pyæmia.	Inflammation of the left elbow-joint had been set up fourteen years before her admission by a severe blow. In three weeks, however, she was quite well, and remained so until eight months before she applied at the hospital, when, without any assignable cause, the joint again inflamed. When amputated, the joint was found to have been quite destroyed. Well marked pyæmic symptoms set in six days before her death. Pyæmia was not prevalent in the hospital at the time.
---	-------	--------------	-----------	---------	--------------------	--

Amputations of Forearm for Accident.

1	M. 9	Mr. Teale	Rectangular.	27 days	Recovery.	The left hand and wrist were completely crushed by cog-wheels. The long rectangular flap was taken from the posterior aspect of the forearm. His recovery was rapid and uninterrupted, and an excellent stump was obtained.
2	M. 35	Mr. Smith	Circular, with side slits.	41 days	Recovery.	The left wrist was very severely crushed, and the hand nearly torn off by a carding-machine. The amputation was performed through the middle of the forearm. He recovered well, with a good stump.
3	M. 22	Mr. Wheelhouse	Circular.	27 days	Recovery.	The right hand was completely pounded by a steam-hammer. His recovery was without a drawback. After his discharge from the hospital, several abscesses formed from time to time in the forearm and arm.
4	M. 23	Mr. Teale	Circular, with side slits.	42 days	Recovery.	The right hand was chopped off through the middle of the metacarpal bones. Circular amputation was performed at the wrist-joint; the ends of the radius and ulna were left intact. Recovery was delayed by the formation of abscesses near the stump. When he left the hospital, all had healed.

Amputations of Forearm for Disease.

1	F. 64	Mr. Teale	Rectangular.	65 days	Recovery.	The operation was performed on very extensive caries of the right carpus and metacarpus, of twenty-five years' standing, the great discharge from which had worn the patient down to death's door. Repeated attacks of cutaneous erysipelus delayed his recovery. The stump itself, however, healed well; and at the time of her discharge from the hospital, was quite sound.
2	M. 44	Mr. Nunneley	Double flap.	10 days	Death a few weeks after his discharge from the hospital, from some head affection.	Destructive inflammation of the right wrist-joint had been set up by a sprain nineteen months before his admission. The disease had destroyed not only the wrist-joint, but had extended to the carpal articulations, and was continuing to spread, in spite of treatment. After the operation, the stump nearly healed by the first intention, but opened out, and became stenchy, and the inflammation extended up the forearm. The end of the ulna made its way through the posterior flap. At the time he left the hospital, he was in a very feeble condition, and afterwards he gradually sank.

Amputations of Thigh for Accident.

No.	Sex and age.	Operator.	Nature of operation.	Stay in Hospital after operation.	Result.	Remarks.
1	M. 16	Mr. Smith	Circular amputation above knee.	3 days	Death from shock.	He fell between two railway trucks, one of which passed over his right leg and knee, crushing the parts very severely. He never rallied after the operation.
2	M. 15	Mr. Wheelhouse	Secondary rectangular amputation above knee.	9 days	Death from exhaustion.	Forty-three days before the amputation, he had been run over by several waggons in a coal-pit, whereby he had sustained the following injuries:—fracture of right femur above the condyles, with protrusion of the shaft to the lowermost part of the ham; fracture of the shaft of the left femur; and severe laceration of the left leg. From pressure upon the popliteal vessels, the right foot became gangrenous. As a line of demarcation formed below the knee, amputation was performed immediately above that joint. He sank without making a satisfactory rally.
3	M. 38	Mr. Nunneley	Double flap (anterior and posterior) amputation through lower third of thigh.	62 days	Recovery, with good stump.	Almost the entire left leg was smashed by a luggage train passing over it. A great portion of the stump united by the first intention, and the remainder by healthy granulation.

Amputations of Thigh for Disease.

1	M. 10	Mr. Smith	Rectangular amputation in lower third.	48 days	Recovery, with excellent stump.	The right knee-joint was destroyed by strumous disease of two years' duration. The whole stump united by first intention, the healing process having gone on with great rapidity. His stay in hospital was prolonged by a slight attack of phagedenic inflammation of the transverse cicatrix, which ceased, however, without having done any material damage to the stump.
2	F. 34	Mr. Nunneley	Double flap. Lateral.	47 days	Recovery, with very good stump.	The amputation was performed for disease of the left knee-joint of twelve years' standing, which was still progressing, and wearing down the patient, by the constant suffering it induced. The whole stump united by first intention.
3	F. 14	Mr. S. Hey	Circular amputation through the middle of the thigh.	47 days	Recovery, with excellent stump.	The condyles and lower three inches of shaft of right femur were expanded to twice their normal size by infiltrating encephaloid disease, the commencement of which dated seven months before the amputation. There were no enlarged glands, and the health of the patient had not suffered beyond what might be attributed to the pain, which, during the last two months, had been excessive. The stump healed rapidly by first intention. The patient remains well, with a perfectly sound stump (November 1864).

Amputations of Leg for Accident.

1	M. 28	Mr. Smith	Irregular. Flap taken from outer side of calf.	18 days	Death from pyæmia.	The left ankle had been very severely crushed by the fall upon it of a heavy hoist. The symptoms of pyæmia began eleven days before his death.
2	M. 26	Mr. Smith	Posterior flap taken from middle of calf.	6 days	Death from exhaustion.	A severe compound fracture of the lower ends of the right tibia and fibula, with wound of posterior tibial artery, had been caused by the fall of a heavy piece of metal; considerable hæmorrhage had followed. After the operation, a slow but continuous oozing of blood from the stump took place. He remained for some days in an exhausted state; and died without having ever made a fair rally.
3	M. 35	Mr. Wheelhouse	Posterior flap amputation just below the knee.	9 days	Death. Gangrene of stump and diffuse inflammation.	The left leg had been very severely crushed by the fall of an arch. Two days after the amputation, the stump opened out, and assumed an ashy and sloughy appearance. The gangrene soon spread nearly as high as the knee, and the tissues in the lower two-thirds of the thigh were intensely swollen. He died exhausted by the intensity of the mischief.
4	M. 48	Mr. Wheelhouse	Rectangular amputation above ankle.	58 days	Recovery, with good stump.	The left foot had been completely smashed by the wheels of a heavily laden railway truck. One half of the stump healed by first intention; the rest slowly by granulation. He went to work as soon as he left the hospital.
5	M. 25	Mr. Nunneley	Anterior and posterior flap amputation through middle of leg.	8 days	Death from exhaustion, consequent on diffuse inflammation of the stump.	A railway engine and tender passed over the left foot, and completely pulpified it as high as the ankle. The amputation was commenced immediately above the ankle by a circular incision; but, in consequence of the damaged appearance of the deeper tissues, the calf was transfixed higher up, and a long posterior flap there obtained; this, with a shorter one taken from the front aspect, made a good cover. Most of the anterior flap sloughed; the whole stump became intensely inflamed; and, whilst the disease was rapidly spreading above the knee, the man died exhausted.

Amputations of Leg for Disease.

1	F. 27	Mr. S. Hey	Rectangular amputation.	36 days	Death from pyæmia.	The patient was exceedingly delicate, having been worn down by eleven years' extreme suffering and continued discharge from the carious bones of the left tarsus. After the amputation, she progressively weakened; and, five days before her death, well marked symptoms of pyæmia were manifested.
2	M. 23	Mr. Teale	Rectangular amputation.	34 days	Recovery.	Disease of the right foot had commenced eighteen months before his admission, with acute inflammatory symptoms; and, at the time of amputation, the ankle-joint and tarsus were hopelessly involved. The stump, which was treated entirely without dressings, healed rapidly and well.
3	M. 20	Mr. Nunneley	Single flap taken from posterior and outer aspect of leg.	17 days	Recovery.	The right ankle and tarsus were affected with strumous disease of twelve months' standing, and the soft parts on the outer side of the foot were in great part destroyed by phagedenic inflammation, which he had suffered from during a previous residence in the hospital. The oval flap taken from the calf united by first intention; but his complete recovery was delayed by three or four obstinate ulcers, which formed along the line of union.

Amputations through Foot for Disease.

No.	Sex and age.	Operator.	Nature of operation.	Stay in Hospital after operation.	Result.	Remarks.
1	M. 16	Mr. Teale	Chopart's amputation.	62 days	Recovery.	The anterior part of the right foot had been very severely injured by a fall of earth eleven months previous to his admission. The whole of the metatarsal and the anterior row of the tarsal bones were fused together, as it were, and upon the dorsum of the foot were several copiously discharging sinuses, which led to diseased and dead bone. The lad's health was very evidently suffering from the continuance of the disease. After the amputation, the extreme edges of both flaps sloughed, the stump opened out, and subsequently healed very slowly by granulation.
2	M. 17	Mr. Nunneley	Chopart's amputation.	75 days	Amputation above ankle.	The right foot became the seat of strumous disease in its anterior part eleven months before his admission; and at the time of operation was so much implicated, as to be beyond hope of recovery. For the first three weeks after the removal of the diseased bones, the stump went on healing rapidly and well; but at the end of that time, repair somewhat suddenly ceased, the flaps separated, and sent forth large, flabby, readily bleeding granulations; the whole stump became boggy and swollen; and the patient's general health ceased to improve. In this condition—which refused to yield to the most generous treatment—he was sent out into the country, in the hope that he might benefit by change of air. For sequel, see Table of Amputations of the Leg, for July 1864.

Original Communications.

RETROSPECTIVE NOTES ON OUT-PATIENT PRACTICE.

By C. M. DURRANT, M.D., Physician to the East Suffolk and Ipswich Hospital.

URINARY SYSTEM. (*Continued from p. 192.*)

2. *Diabetes.* Two cases of diabetes have fallen under my notice as out-patients during the last two years. One was a girl aged 16, who had twice before been much benefited by treatment for the same disease. The second case was a coachman, who had been exposed to much fatigue and late hours when serving in that capacity. This man was admitted as an in-patient.

In reference to the pathology of the disease, we must admit that we are at present ignorant of the changes which take place in the system, producing the diabetic condition. From the marked influence of ethers, ammonia, and other stimulants, upon the stomach, in this disease, I am disposed to attribute very much to the influence of the sympathetic and pneumogastric nerves; but the *modus operandi*, and whether they exert an influence as direct excitants, or merely receive the impression of an abnormal condition of the blood generated by disturbed hepatic function, is not at present known.

In the treatment of the disease, the regulation of the diet is, of course, of the first importance. This may be comparatively easy to effect in private practice; but in the case of the poor, and especially among the out-patient poor, who cannot be made to understand the necessity for abstaining from bread, potatoes, apples, etc., it becomes a very difficult task to teach them "what to eat, drink, and avoid." Animal food of all kinds, including fish and eggs, may be taken; from which, however, Dr. Pavy excludes liver, a favourite article of diet with the poor.

I was once consulted by a gentleman suffering from diabetes, who had eaten three hundred partridges during the progress of the malady.

In allowing broths and soups, we should be careful to direct that they be not thickened.

In reference to bread, two or three ounces of the brown aerated bread, toasted, may be allowed night and morning. I have tried both the bran and almond breads; but I am not certain that greater advantage was gained from their use than in the allowance of the small portion of toast above referred to.

Cheese and butter are not objectionable. Greens, spinach, water-cress, mustard and cress, and salads,

but not beet-root, may be taken; and they materially assist the patient in persevering with an animal diet. Potatoes, carrots, parsnips, turnips, and peas are objectionable, and must be forbidden.

Of beverages, tea and coffee, without sugar, and with but a spare quantity of milk. Dry sherry, claret, or weak brandy and water. Sometimes, from debility, bitter ale may be needed; and occasionally I have fancied that sound porter has, by improving the general tone, acted favourably.

In reference to medicines, the great indication is to keep up a due supply of nervous power in the digestive organs; and, with this view, a combination of ammonia with soda, chloric ether, and opium, sometimes answers well.

Some years ago, a medical friend urged me to try the effect of the so-called chlorodyne in diabetes, which, he said, had been taken with great advantage by a nephew of his own, with the sanction of the late Dr. Bright, under whose care he then was. The dose which had been found to agree best, after many experimental trials, was twenty minims three times a day, in water or camphor mixture. I tried it in the first case that occurred, and I have prescribed it in several instances since; and in none has it failed (provided that the disease be not far advanced) to give great relief to the patient, more especially by removing thirst, diminishing the quantity of urine, and rendering his feelings those of comparative health. It benefits to this point, but fails in removing the sugar from the urine. As an unacknowledged composition, I should not have referred to it, had it not proved decidedly useful in cases under daily observation. I have tried creasote; but in one case only did it appear to do good. Cod-liver oil is a valuable medicine as a tonic in this disease; and the preparations of iron may also be given with great advantage, if the patient become weak and anæmiated.

The diabetic should wear very warm clothing; and the more his system can be invigorated by being much in the open air, the greater will be the prospect, *ceteris paribus*, if not of recovery, of prolongation of life.

3. *Enuresis.* Functional incontinence of urine has obtained in three cases among the out-patients—one in a boy, aged 8; and two in females, aged 14 and 16, both having menstruated regularly. As a rule, this affection occurs more frequently in boys than in girls; but I have found it to continue longer, and to be more troublesome, in the latter sex than in the former.

Enuresis of the character that we are now considering depends upon perverted nervous tone, inducing irritability of the bladder, which contracts upon its contents before the sensation of uneasiness and desire to evacuate is excited; and with this

there exists often a weakened condition of the sphincter itself.

The treatment, to be effectual, must be decided. A large blister over the sacrum seldom fails to alleviate, if not to cure. With this, the extract of belladonna, in full doses proportioned to the age of the patient, combined with the sulphates of iron and quinine, or the tincture of the sesquichloride of iron, generally effects a cure.

In cases of incontinence of urine occurring in the hysterical female of more advanced age, the disease will often baffle for a long period the best regulated treatment.

GENERATIVE SYSTEM.

The medical cases included under this head, with the exception of leucorrhœa, have been simply those affecting the due and healthy discharge of the catamenial function; and the following observations apply only to these simple idiopathic forms of functional disturbance, quite unconnected with organic or structural lesion.

1. *Amenorrhœa*. This form of disease constitutes a very common out-patients' malady; and, in the two years upon which these notes are based, suspended menstruation affords the majority of all the cases of uterine disorders under consideration.

Amenorrhœa arises for the most part either from local plethora, or from anæmia and defective nerve-tonic; the former cases presenting the appearance of rude health or superabundant circulation, while the latter is attended with general constitutional debility.

In the treatment of amenorrhœa from plethora, the vascular system requires relief, by reducing the over-energetic action, upon which the suspended menstruation frequently depends. For this purpose, I have found no medicines act better than alkalies with colchicum, and spirit of nitrous ether. The following formula answers exceedingly well, and is generally effectual in re-establishing the flow, when suspended from tonic or plethoric influence.

(Ph. Lond.) R Potass. bicarb. ʒiiss; potass. nitrat. ʒiij; tincture colchici ʒi; spiritus æther. nitrosi ʒiij; mist. camph. ʒviij. M. A sixth part three times a day.

A steady use of aperients, combined with a light unstimulating diet and warm clothing, must be had recourse to at the same time.

In the atonic variety, the regulation of the digestive organs, and subsequently the chlorate of potash with iron, will be the best remedies. Warm clothing, stimulating pediluvia, and change of air, are also highly important auxiliaries to the treatment.

The diet should be light, with sherry or claret, in preference to malt liquor; and exercise taken daily in the open air, but not sufficiently prolonged to fatigue unduly, or to exhaust nervous tone.

2. *Menorrhagia*. In this form of functional uterine derangement, we find the plethoric and atonic conditions equally influential as excitants to the disease, as in the case of catamenial suppression.

In forming a diagnosis, it will be necessary carefully to distinguish between the excessive amount of menstrual flow which is almost natural to some females, and the persistently recurring hæmorrhage, whether periodical or otherwise, which, by destroying the balance between loss and reparation, and thereby deteriorating the general health, constitutes true menorrhagia.

In the treatment of menorrhagia depending upon plethora, moderately sustained purgation, induced by the sulphate of magnesia, will be beneficial. With this I often give the bichloride of mercury, in doses of one-twentieth or one-sixteenth of a grain, at

bedtime; and during the day, a mixture of the citrate and nitrate of potash, with the aromatic spirit of ammonia.

If the hæmorrhage depend upon atony, or relaxation of fibre, large doses of the dilute sulphuric acid, either alone or in combination with gallic acid, will be necessary.

If there be decided anæmia, the sulphate of iron, in grain doses, combined with the sulphuric acid, will often prove a useful addition. In obstinate cases, the ergot of rye in full doses, with digitalis, may be advantageously tried.

In the treatment of menorrhagia depending either upon plethora or atony, the horizontal posture should be strictly maintained. The more severe cases, requiring plugging the vagina and the use of styptic injections, scarcely fall within the category of out-patients' maladies.

3. *Leucorrhœa*. The next most frequent form of sexual derangement which has obtained has been leucorrhœa. This is a disorder of much greater frequency and obstinacy in the larger manufacturing towns, where young females are confined and crowded in hot workrooms, than is seen in the agricultural districts, where these exciting causes of debility exist in a less degree. Cases of leucorrhœa constitute, however, a large proportion of those who apply for relief as out-patients at our hospitals and dispensaries.

The disorder may be acute, or chronic; but, in the very great majority of instances, it is essentially chronic, and depending upon a deranged and debilitated condition of the general health.

Having satisfied ourselves that the uterus is structurally unaffected, we shall find that strict attention to the general health, and mild local applications, will in the majority of cases be sufficient.

The acetate of potash in scruple-doses acts in many cases very favourably upon the discharge. With this I usually combine the aromatic spirit of ammonia. If the digestive organs will bear it, steel may be given with great advantage in addition.

In reference to strong astringent vaginal injections, I have been much disappointed in their use. If there be evidence of subacute inflammatory action of the mucous membrane, the liquor plumbi subacetatis dil. will be serviceable; but in the more common forms, resulting from constitutional debility, cold water, injected into the vagina in a continuous stream, will be, I think, the best local remedy. The water should be quite cold, and injected for some minutes at a time, so as to make an impression upon the capillaries of the mucous membrane. Cond's fluid, in the proportion of one to two drachms to the pint, will remove the faint sickly odour from the discharge, which is very distressing to some females. Where expense is less an object, Kennedy's elastic bottle-syringe is the best that can be used for the purpose. A cheaper instrument, on a similar principle, has been lately introduced.

In the case of unmarried females, injections as a rule should not be used; but the interlabia bathed frequently with very cold water.

4. *Dysmenorrhœa*. But one case of painful menstruation, in which the periodical suffering was sufficient to call for especial relief, has presented during the two years. This case occurred in a sempstress, and had existed, with more or less severity, since puberty, which had been established for two years.

In the treatment of dysmenorrhœa, the indications will be to afford relief during the painful period, and afterwards to endeavour to improve the general health during the interval, the deranged condition of which so materially aggravates the attack.

As the patient is often generally and locally ple-

thoric, a few leeches to the upper part of the thighs, applied two days before the expected period, will be desirable. With this, a piece of flannel about fourteen inches wide, and folded twice, should be wrung out of a hot and strong decoction of poppy-heads, and wrapped round the pelvis, and covered with oiled silk. This fomentation may be renewed three times a day; and its application should be had recourse to for two or three days prior to the expected suffering, and continued steadily during the period. Of medicines, none, I believe, answer better to relieve the pain than nauseating doses of ipecacuanha, combined with opium, and the extract of stramonium, if the symptoms be very severe. During the interval, no preparation answers better than steel; but care must be taken that such doses and such forms only be given as the stomach will readily assimilate. The following formula is sometimes very useful for the purpose.

(*Ph. Lond.*) ℞ Ferri sulph., zinci valerianat., a gr. i; ext. nucis vom. gr. $\frac{1}{2}$; ext. belladon. gr. $\frac{1}{4}$ ad $\frac{1}{2}$. M. Fiat pilula. To be taken three times a day.

[To be continued.]

COLD INJECTIONS INTO THE UTERUS.

By A. G. ROPER, Esq., Croydon.

THE following cases of *post partum* hæmorrhage testify to the success of cold water injected into the uterus in this serious disaster. This proceeding I have adopted for some years, with the same unvarying result of the immediate check of the flooding and the permanent contraction of the uterus.

I have also found cold injection either into the vagina or uterus, of much service in those troublesome hæmorrhages which accompany or succeed abortions in the earlier months.

CASE I. Mrs. M. was confined May 29th, 1863, with her first child. The labour was natural. Two hours after the birth of the child, I received a message, stating that Mrs. M. was in great pain, and was faint; but that there was no hæmorrhage. Suspecting the nature of the case, I took my elastic syringe with me. My patient was faint, pallid, with cold extremities, and nearly pulseless. There was no external hæmorrhage; but the uterus approached in size to the full term. I injected cold water. Many clots were expelled; the hæmorrhage ceased; and the uterus remained permanently contracted.

CASE II. Mrs. M. was confined with her first child on April 24th, 1864. The labour was natural. The placenta was cast into the upper part of the vagina with the last expulsive effort of the uterus in the birth of the child. The removal of the placenta from the vagina was followed by excessive flooding. External pressure effected nothing more than a partial check to the hæmorrhage; and my patient became rapidly pallid and faint, the flooding being greater than I have ever witnessed. This ceased immediately on the injection of cold water; and the uterus remained permanently contracted.

ARTIFICIAL LEGS. The United States Government has increased the pay heretofore allowed for artificial legs furnished to soldiers. At the present rate (\$75), the manufacturers can afford to furnish their best limbs without extra charge. The liberality of the Government, and the necessities of many thousands maimed heroes, have stimulated the inventive powers of the ingenious, and the substitutes for lost limbs are reaching a high degree of perfection. Reviews and Notices.

BENEFICENCE IN DISEASE. An Introductory Address delivered at St. Mary's Hospital. By JOSEPH TOYNBEE, F.R.S. London: 1865.

MR. TOYNBEE endeavours, in this Address, to prove what he calls the "beneficence of disease". We think he fails in the attempt; and fails in consequence of having confused together the symptoms of disease and the disease itself. Mr. Toynbee says that disease is the result of an injury done to the body: "an impression has produced an injury to the body, and disease is the result." Now, to our view, the injury is the disease. Fire burns—*i. e.*, injures—flesh. The burn—the injury—is to all intents the disease. The impression fire has produced an injury, and this injury is the disease. The disease cannot be separated from the injury which represents, and is, the very disease itself.

But Mr. Toynbee has himself given illustrations of his views which clearly show the fallacy lying at the bottom of his argument.

"Thus," he says, "at the outset, I think it must be manifest to every medical man, that, in many instances at least, disease, instead of increasing, in reality repairs the injury from which it arose. A cough, obviously, often seems to remove the source of the injury which causes it—*e. g.*, a foreign body from the windpipe. Vomiting, again, often answers the purpose of ejecting noxious matter from the stomach. Accordingly, we look upon these diseases as of a reparative character," etc.

Now the fallacy here is transparent. Neither cough nor vomiting are diseases; they are simply reflex actions. They are just of a kind with that spasmodic closure of the glottis which is induced, for example, by the attempted inhalation of pure carbonic acid. Cough is not disease: it is merely one of the symptoms of disease, and may depend upon a score of different diseases. Does cough in any way cure tubercle of the lungs, or aneurism, or a laryngeal ulcer? The "impression" spoken of by Mr. Toynbee, in the case he here gives, is manifestly the foreign body in the windpipe; and the "injury" is the irritation, etc., excited by its presence. The "disease" here is assuredly the local injury caused by the foreign body. In no sense can the cough be called the disease, as Mr. Toynbee has it.

Then again says Mr. Toynbee: "An attack of scarlet fever seems to rid the system of the poison causing the scarlet fever, etc." Now surely, if this argument is to hold good, we might equally well speak of the beneficent effects of poisons. An attack of hydrophobia, Mr. Toynbee might equally argue, seems to rid the system of the poison causing the hydrophobia.

Mr. Toynbee also naturally draws illustrations of his position from his own department of surgery; and one or two of these we may add.

"In truth, so commonly is it manifest that diseased processes terminate in the reparation, partial or complete, of injuries, that the thought can hardly fail to suggest itself, whether, in these instances, the fundamental character of disease be not exhibited; whether, in fact, diseases may not be regarded as Nature's processes for repairing or lessening injuries? I have thought it well to bring before you some facts,

which to my mind tell in favour of this view, confining my illustrations to that branch of surgery which I now exclusively practise, and which I teach in this medical school.

"CASE I. Two or three years since, a man was admitted under my charge into St. Mary's Hospital, having the pendulum of a clock, eighteen inches long, projecting from, and firmly impacted in, his right ear. He, a German perambulating clockmaker, in the act of picking his ear with the hooked end of the pendulum, had it forcibly thrust into the outer meatus by the unfortunate reel of a drunken baker passing by. The house-surgeon, by the exercise of great force, pulled out the pendulum, the hook of which not only lacerated the dermis, but scraped the bone. Here was the *injury*, the disease which followed consisted in inflammation and profuse supuration, and afterwards catarrh of the dermis, forming for some weeks a case of, so-called, *otorrhoea*; but by degrees this disease vanished, and the injury to the ear was wholly repaired. Now, here was a well-marked instance of the presence of a disease, the result of which was to repair an injury." (Pp. 13-14.)

"CASE II. A gentleman hunting, galloped along a green lane through a wood, and a twig of an overhanging beech tree penetrated the tube of the left ear and lacerated the drum. Inflammation and supuration and catarrh of the dermoid layer followed; another form of disease usually called *otorrhoea*, thus presented itself; after a short time, however, the aperture healed, and the hearing was restored." (P. 16.)

"CASE III. A scrofulous lady, who was much out of health, when picking her ear, let a pin fall into the meatus; during attempts at its removal, the point of the pin was pulled by a pair of forceps into the substance of the meatus, and there left. Inflammation and supuration round the end of the pin followed, as in the preceding case, but it extended to the mucous membrane of the tympanum, thence to the membranes of the brain, and caused death." (P. 17.)

Clearly, in all this, Mr. Toynbee confuses the symptoms of disease with disease itself. If he had told us that we often see beneficent efforts in the system to counteract or compensate for the effects of other diseases or injuries, we could fully follow him. We may see beneficence in the hypertrophied heart which compensates for defective valves. We may see beneficence in the one enlarged kidney which is found compensating the loss of the other kidney. We may see beneficence in the hypertrophied muscular structure of the bladder in cases of stricture. We may see beneficence in the enlarged collateral arteries which follow obstruction of an arterial trunk; etc. But surely all these things can in no sense be called diseases, any more than is the cough attending bronchial irritation.

"Cases of scarlet fever, small-pox, cow-pox, measles, etc., terminating favourably, rectify the several injurious conditions in which they take their origin," says Mr. Toynbee. Here, again, there is much confusion and obscurity of language. If this sentence mean anything, it means that scarlet fever cures scarlet fever! Surely Mr. Toynbee would not call the fearful convulsions resulting from strychnine beneficent; and yet they are so, according to his mode of arguing. For in what respect does scarlet fever, as a disease, differ from strychnine-poisoning? In both cases, we know that a poison is introduced into the system. In both cases, the poison produces certain characteristic symptoms. In neither case do we know how the poison acts. All we do know further

is, that according to the strength of the poison introduced, and the state of the body, etc., in which it operates, will be the chance of the recovery of the patients. "An attack of scarlet fever seems to rid the system of the poison causing the scarlet fever." But what is an attack of scarlet fever, excepting the manifestation of the presence of scarlatina-poison in the body? What are those manifestations, except morbid symptoms excited by the poison? Here, as in the case of strychnine-poisoning, either life is destroyed, or the poison is gradually eliminated from the body, or ceases to excite further morbid action, and the patient recovers.

Mr. Toynbee might assuredly have drawn a much more secure basis for his argument, had he gone back to the origin of the diseases to which he especially refers. For example, he might have spoken of the beneficence of fevers, when they lead men wisely to remove the sources of them. He might have largely dwelt on this theme, and have shown that a very large portion, at all events, of the diseases which mankind suffers, are in this way distinctly traceable to acts which are deviations from the laws of Nature; and thus have shown that all this large class of diseases are removable, if man will only act in accordance with the laws of Nature. In such sense, the beneficence of disease might, we think, be excellently exemplified. But to attempt to show the beneficence of cancer as cancer, or of tubercle as tubercle, of an ovarian cyst, or of rheumatic fever as a destroyer of the valves of the heart, is a task, we must say, which appears to us impossible in our present state of knowledge.

ON THE TEMPERATURE OF THE BODY AS A MEANS OF DIAGNOSIS IN PHTHISIS AND TUBERCULOSIS. By SYDNEY RINGER, M.D., Professor of Materia Medica and Therapeutics in University College, etc. Pp. 90. London: 1865.

THE object of this work is sufficiently denoted by its title. Dr. RINGER gives the analyses of the histories of twenty-five cases, as examples selected from a number observed by himself and others, and on which the following propositions are based.

"1. There is probably a continued elevation of the body in all cases in which a deposition of tubercle is taking place in any of its organs.

"2. This elevation of the temperature is probably due either to the general condition of the body (tuberculosis), or to the deposition of tubercle in its various organs (tubercularisation).

"3. This elevation is probably due to the general condition (tuberculosis), rather than to the deposition of the tubercle (tubercularisation).

"4. The temperature may be taken as a measure of the amount of the tuberculosis and tubercularisation, and any fluctuations in the temperature indicate corresponding fluctuations in the severity of the disease.

"5. The temperature is a more accurate indication of the amount of tuberculosis and tubercularisation, than either the physical signs or the symptoms.

"6. By means of the temperature we can diagnose tuberculosis and tubercularisation long before the physical signs and symptoms are sufficient to justify such a diagnosis.

"7. By means of the temperature we can diagnose tubercularisation even when during the whole course of the disease there are no physical signs indicative of tubercular deposit in any of the organs of the body,

and in which cases the symptoms (apart from the temperature) are inadequate to enable us to arrive at such a diagnosis.

"8. It is probable that by means of the temperature we can conclude that the deposition of the tubercle has ceased, and that any physical signs that are present are due to obsolescent tubercle and the chronic thickening of the lung-tissue between the tubercular deposit.

"9. It is probable, though further observations on this point are necessary, that the temperature of the body affords a means by which we can diagnose between diseases in which the symptoms and physical signs are either too scanty or too much alike to enable us to decide between them."

Each of these propositions is commented on *seriatim*. Dr. Ringer has started a very useful and important subject for consideration; and, if the mere observation of the temperature of the patient's axilla shall aid physicians in forming a judgment of the progress of a case of phthisis, or in diagnosis of tubercular from non-tubercular disease, the author of this work will have done a good service to medicine. There can be no doubt that, whether on empirical or on other grounds, the observation of the changes in the temperature of the body in disease deserve more attention than has been paid to them.

ON SOME POINTS CONNECTED WITH THE PATHOLOGY, DIAGNOSIS, AND TREATMENT OF FIBROUS TUMOURS OF THE WOMB; being the Lettsomian Lectures on Midwifery and Diseases of Women, delivered before the Medical Society of London, 1863. By C. H. F. ROUTH, M.D. Lond., etc. Pp. 135. London: 1864.

THE three Lectures which form this work have already appeared in the pages of the BRITISH MEDICAL JOURNAL, where they must have afforded much instruction to many of our readers. We have, therefore, only to mention the fact of their publication in a separate form; and to express our hope that Dr. ROUTH will receive the due reward for having so ably placed before the profession the results of his literary research and practical experience.

THE SCIENCE AND PRACTICE OF MEDICINE. By WILLIAM AITKEN, M.D. Edin., Professor of Pathology in the Army Medical School, etc. In two volumes. Vol. I; pp. 933. Vol. II; pp. 993. Third Edition, revised, and portions rewritten. London: 1864.

THAT a third edition of this valuable work should be called for within a year after the appearance of the second, is not at all surprising. In preparing the book for the press on the present occasion, Dr. AITKEN has, he says, submitted every page to a careful revision, and has "especially aimed at improving the work by rewriting some portions and condensing others, in order to make room for new material, especially regarding the treatment of diseases." He specially acknowledges his obligations to Dr. Graham Balfour, for having revised and corrected the part which treats of Medical Geography.

It is a little more than a year since we expressed our favourable opinion of the merits of Dr. Aitken's *Science and Practice of Medicine*. What we then said of the second edition, is equally deserved by its successor.

WE beg to remind the members of the Association that the annual subscription for 1865 became due on January 1st. Payment of the same can be made either to the Honorary Secretaries of Branches; or to the General Secretary, T. Watkin Williams, Esq., 13, Newhall Street, Birmingham.

British Medical Journal.

SATURDAY, MARCH 11TH, 1865.

THE MEDICAL COUNCIL.

THE Medical Council will reassemble early in next month, at the Royal College of Physicians in London. It is understood that this early date of meeting is fixed in order to allow the Council, if possible, to procure alterations of the Medical Act during the present Parliament.

The Council is, therefore, as heretofore, full of schemes for the good of the profession; but it has as yet, unfortunately, done for us none of the great things expected of it. Since we last cast up its accounts of activity and passivity, a year has passed; and we find nothing since then added to its balance-sheet of things actually done—except, of course, a further addition to its annual expenditure—except, as we have said, in so far as it has been engaged in inquiring and scheming in order to learn how to do something for the good of the profession. It has up to the present time given us a *Register* and a *Pharmacopœia*; and for these blessings and favours the profession has paid some £50,000! But as yet, in the matter of education—its main business—it has settled nothing. Year after year has the *Council of Medical Education* met and met, and talked and talked, and recommended, and advised; but each revolving year has found the matter of medical education left where it was by the preceding year. Seven years—*fugaces anni*!—in truth, have passed since the Medical Council undertook to regulate the medical education of the country; but still medical education is without regulation! What will the Council do with it during this coming session? One great business of the Council, it appears, will be to attempt to obtain alterations in the Medical Act. If, therefore, the Council's energy be concentrated on that object, what will become of medical education? How many more annual meetings of the Council of Medical Education must we record barren of operations effective to settle the medical education of the country? Suppose some member of Parliament ask the Medical Council, when they apply for alterations in the Medical Act: "But, gentlemen, have you already done those duties which devolved upon you under the Act? Before you ask for further powers, tell us how you have used the powers

you possess. Give us an account of your stewardship." Could the Council give a satisfactory reply? Can the Council satisfactorily explain to the profession why they have not already pronounced a solemn scheme of professional education? We fear not.

Let us see how the Council last left this subject, and ask whether it did not then again evade instead of boldly meeting the difficulties—if it did not temporise with the matter, and get rid of it for the moment by a side-wind. And what did the Council do? Instead of dealing with it, the Council said: "We will frame questions on education; send them round to the different educating and examining bodies, and get their opinions thereon. Then we shall see what we shall do—how we may proceed—in another year's time; and thus shall we get breathing-time." Now, in our opinion, this proceeding was an evasion of its duty on the part of the Council; and for the following reasons.

The Medical Council is composed of representatives of all the great medical corporations of the country—is, in fact, the *élite* of the teachers and examiners in medicine. The Council, therefore, is composed of men who have full and perfect knowledge of everything that is known about medical education—of men who are well acquainted with the sentiments and wishes and opinions, touching education, of every medical corporation and examining board in the country—of men who know to a tittle what ought to be demanded of the student in the way of education, and what of candidates for licenses to practise medicine and surgery; who know where the present system is weak, what screws in it are loose, and how they may be tightened. But, with all this perfect and complete knowledge of the subject—its especial business—the Council goes on year after year, may we not say, shilly-shallying and playing with the subject, and settling nothing. It lays down no grand national scheme of medical education.

Does it not, indeed, really seem something worse than superfluous, that the Council, which has been now for many years engaged in studying this question of education, which is composed of representatives of all the different medical corporations, etc., of the country—of gentlemen who are sent to the Council to explain, express, and enunciate the views and opinions of those medical corporations, etc., in Council—we ask, does it not seem something more than superfluous, that such a Council should apply, by solemn questions, to those corporations, which they themselves represent, to learn their views on medical education? We will venture to say, that there is not at this moment in the Council a single member of it who has not long since made himself master of the wishes and opinions of every medical body in the country on the subject of medical education. Why, then, does the Council go through the vain process of putting questions of which it already

has and knows well the answers; and of thus adjourning indefinitely the settlement of a scheme of medical education?

Surely it is not for want of information that the Council thus puts off from year to year the performance of its duty. Well, we suppose the profession has long ago learnt, from the reports of the discussions of the Council, that the Council cannot assume to themselves the broad title of national; that there are members of it, in fact, who regard much more the interests—the selfish interests—of the bodies which they represent, than they do the interests of the profession and of the country at large. But surely, if the Council as a Council be of any service at all in this matter, it must be by itself laying down and enforcing the adoption of a grand national scheme of education. If the Council confess that it is of itself unable to frame such a scheme, it virtually confesses its incapacity for the performance of the duties of Councillors; or if it have not the courage to enforce the carrying out of the scheme which it considers right, then again does it confess itself unequal to the duties and functions which it has assumed. There is no escape from this dilemma but one; and that is, that the Council has not, by law, the power to enforce the carrying out of its own proposals. But this is really a mere excuse.

The Privy Council can prevent any recusant examining board from granting licences; and it has never yet been shown that the Privy Council would refuse to grant such interdict at the instance of the Medical Council, in any case where it could be shown that a licensing body refused to acknowledge the terms of education laid down by the Medical Council. But, if the Privy Council would not or could not interfere, why then does not the Medical Council apply to Parliament for the necessary powers of carrying into act its own schemes?

If the Medical Council—a Council of Medical Education—after years of study of the subject, have neither knowledge sufficient to draw up a scheme of a national medical education—if it have not power sufficient to enforce the general adoption of any scheme which it may propose—of what use is such a Council? This is the question which, it seems to us, must occur at the present moment to the profession at large; and which we think we are justified in forcing upon the consideration of the Medical Council itself at the present moment.

We believe we are justified in adding that, as the matter stands at the present moment, it is neither from want of sufficient knowledge, nor from want of sufficient power, that the Council does not act; but solely from want of sufficient courage. Some one or other of our great examining bodies, being strongly represented in Council, defeats the good intention of (we believe) the majority. The some one or other of our great corporations concludes that a proper

scheme of education, such as we must suppose the Council might expound, would be injurious to its own proper interests; and, thereupon, this one or other of the great corporations exercises its powerful and selfish influence so effectually as to burke the good intentions of (we believe) the majority of the Council. The majority, kind and gentle by nature, yield to this powerful pressure: and hope, in the course of time, to subdue it by the force of "moral suasion."

On another page is published a list of the successful candidates for medical appointments in the army, at the competitive examination in August last. The list contains the names of seventy-seven gentlemen, with the places at which they received their education, and the number of marks they obtained. Of the 77, the English schools of medicine furnished only 10; viz., 8 from London and 2 from Birmingham. Scotland sent 18; viz., 8 from Edinburgh, 7 from Aberdeen, 2 from Glasgow, and 1 from Edinburgh and Glasgow. With the exception of two candidates, who respectively entered Cork and Edinburgh, and Belfast and Glasgow, as the places where they were educated, the remaining candidates—47 in number—came from Irish schools; viz., 32 from Dublin, 7 from Cork, 1 from Belfast, 3 from Dublin and Galway, 2 from Dublin and Cork, and 2 from Dublin and Belfast. Of marks—the highest number attainable, we believe, being 6000—the candidate standing first on the list obtained 5247, and the lowest 2392. On further analysis, we find that 2 candidates only obtained more than 5000 marks: 14 more than 4000 and less than 5000: 46 more than 3000 and less than 4000; while the remaining 15 ranged from 2392 up to 3000. Of the candidates from London, 3, holding the 3rd, 8th, and 14th places, had above 4000 marks; and the other 5 varied from 3494 (No. 35) to 2698 (No. 71). The two Birmingham candidates had respectively 3690 and 3292 marks. Of the Scotch candidates, one—from Edinburgh—stands first on the list, and is followed immediately by one from Aberdeen and Glasgow. Altogether the position of the Scotchmen is fairly good: there being 2 with more than 5000 marks; 4 with above 4000 and less than 5000; 11 with more 3000 and less than 4000; and one alone—the last but one—with less than 3000. Among the Irish candidates, the 7 Cork men, in proportion to their numbers, stand highest—the numbers affixed to their names ranging between 4310 (No. 9) and 3530 (No. 32). The Dublin candidates, who form a very large proportion of the total number—being 32, exclusive of 7 educated partly in Dublin and partly in Galway, Cork, or Belfast, occupy various positions; but the majority—22—have places below the fortieth name on the list, with numbers ranging from 3417 to 2392.

Of the remaining 10, 4 have above 4000 marks to each of their names. It is evident that, but for the influx from Ireland, the supply of candidates for the Army Medical Service would have been very defective: and further, that the greater part of this supply has consisted of but an inferior class—men who cannot approach two-thirds of the marks required, most, indeed, falling very far short even of this. The English candidates, also, occupy on the whole but a very mediocre position—decidedly not nearly so good as the Scotch candidates, or those educated in the Queen's College at Cork. Considering the numbers and the education of London students, this is a state of things which one would not *a priori* expect; and the only reason that can be assigned for it is, that the higher class men from the English medical schools do not find it worth their while to enter the army. We can scarcely congratulate the Director-General on the results of the August examination. If the service had been made properly attractive, he would without question have had applications by the score from men superior to at least one-half of the recent candidates. But now the Director-General's list contains, as it appears to us, a large proportion of those "third class men" who have been declared by men in high authority to be good enough for the British soldier. These remarks, it must be understood, apply to the result of the examination held in August last. Of that which was held lately, we have as yet no details; but we have been informed that, on that occasion, 57 candidates presented themselves for the Royal Service and 35 for the Indian Service—making in all 92; and that of these 30 were rejected. Of what stuff the successful candidates were made, we shall probably hear at a future time.

Our readers will, we are sure, be pleased to learn that the efforts made by the British Medical Association on behalf of the army medical officers have already produced some beneficial effects. We are glad to be able to note that certain improvements have been recently made in the Medical Department of the Army. In the first place, we may remark, that the branding order has been modified, and freed from its objectionable features. Then, again, regular forage allowance has been granted to medical staff-officers, and not, as heretofore, only when they had particular charges, which very rarely ever happened. The result of this is, that all staff-surgeons and deputy-inspectors have their horses' keep provided for them; whereas formerly they paid for the keep out of their own pockets, if they had horses at all. And, moreover, we find that, in the matter of baggage, the surgeon now is allowed his proper quantity, according to rank; whereas formerly, by the Queen's regulations, he was only allowed 13 cwt. where he had a right to 18 cwt. according to rank.

Then, again, the surgeon has been relieved of very considerable expenses to which he has been hitherto liable. He is not now charged the expenses of new commissions on being transferred from the staff to a regiment; nor is he made to pay new subscriptions to mess and band funds, on occasion of exchange or transfer. In future, the medical officer will only have to pay the current subscriptions of the year. This will prove a great saving to many men who may be often moved about from one post to another. And, lastly, we must not omit the fact that honours have been of late awarded with an unusually liberal hand, as in the late New Zealand war. All these are very satisfactory signs, indicative of a tendency on the part of the Horse Guards to listen to the opinion of the profession, and to do something like justice to our army medical brethren. Never, however, will the army medical officers and the profession rest contented until due rank and precedence, such as was granted to them by the Warrant of 1858, has been restored to them. It is self-evident that no body of men, with the feelings of gentlemen, can occupy contentedly the position assigned to army medical officers, and accept the often painful position of inferiority which they are made to hold in relation to their brother officers, through want of the proper precedence of rank. The profession must claim for their army brethren a return to the Royal Warrant of 1858.

DR. R. DAVYS has been unanimously elected Coroner for the Northern Division of the County of Dublin.

DR. BABINGTON, who was recently elected a member of the Government Commission on Contagious Diseases, has brought the subject of registration of prostitutes, etc., under the notice of the Epidemiological Society. We may therefore, we suppose, consider his views as indicative of the course which will probably be pursued in this matter by the Commission.

M. JOLLY has delivered a well-written and scientific and reasonable counterblast to tobacco before the French Academy of Medicine. His proofs will, however, we suspect, hardly satisfy the smokers of the world. It is often not an easy thing to bring home guilt even to a guilty party. M. Jolly makes statistics show that tobacco-smoking has greatly increased mortality, and particularly of death from nervous diseases, and of men. The tables of mortality, he tells us, for the last twenty years, show a much greater mortality of men between thirty and fifty years of age, than of women. And what, he asks, must be the cause? When a man has reached from thirty to fifty, he has already paid his tribute to death from war; he has also paid his tribute to the diseases

of adolescence, eruptive fevers, and tuberculous diseases. The statistics of mortality answer the question by showing that it is from an increase of nervous diseases that this mortality is caused—an increase of that long list of diseases which result from all kinds of physical, moral, and intellectual excitements, and, above all, from the effects of the abuse of tobacco. How is the evil to be remedied? To attempt the suppression of smoking is a Utopian idea. M. Jolly recommends that men, if they must smoke, should use the tobaccos of Greece, of Arabia, of Paraguay, which only contain small proportions of nicotine, instead of using those tobaccos which are saturated with the poison. By so doing, agriculture would gain 20,000 *hectares* of excellent land, which are now used in the cultivation of a poisonous plant. Or, if this cannot be, then let science deprive the strong tobaccos of their excess of nicotine, and replace it with perfumes, etc.; and also let the public be enlightened as to the evils which tobacco-smoking is at present inflicting on society. To those interested in this subject, M. Jolly's paper will be found exceedingly interesting, and full of statistical materials.

M. Fournié, by an ingenious contrivance, has demonstrated to a class a polypus situated on the border of the left lower vocal chord. He employed the magnesium light, which costs about one shilling a minute, by means of the lamp of M. Mathieu-Plessy. The rays are thrown on to the mirror at the back of the throat, and then, by means of a biconvex lens placed in front of the patient's mouth, the reflexion of the polypus is greatly magnified, so as to be visible to persons several yards from the object.

The Surgical Society of Paris has for some time past urgently pressed upon the Administration the propriety of not building the new Hôtel Dieu larger than will suffice to contain four hundred beds. All their efforts so far appear to have been unavailing; for it is decided that the new building shall contain upwards of eight hundred beds! One more attempt—a "supreme effort"—the Society is going to make, under the leadership of M. Velpeau, in favour of a small hospital.

Dr. Boncewicz, a Polish physician, who lately died, has left all his fortune to medicine and his brethren. He has bequeathed 100,000 *francs* to build a house for the Society of Physicians of Warsaw; 60,000 *francs* to support two young men while devoting themselves to the study of moral and technical sciences; 50,000 *francs* for the support of five poor widows of medical men; and 10,000 *francs* to the Deaf and Dumb Asylum. His library, full of precious books, is to be distributed amongst the most deserving and needy students of the University of Warsaw.

Progress of Medical Science.

SURGERY.

PREVENTION OF SUPPURATION AFTER OPERATIONS ON TUMOURS. At the meeting of the Academy of Sciences on November 28, M. Velpeau communicated a note from M. Pétrequin, in which that surgeon advocated the application of tincture of iodine as a means of preventing suppuration after the removal of tumours; especially in situations such as the face and neck, where it is desirable to prevent the formation of cicatrices. Hitherto, M. Pétrequin observed, iodine has been applied with the view of modifying the suppurative process; but M. Pétrequin's object has been to prevent it altogether. He has, like M. Velpeau, many times observed that, in hydrocele, for instance, suppuration was less likely to follow the injection of tincture of iodine, than of wine. He has never seen suppuration follow the injection of iodine into the parenchyma of organs, into glands, into the thyroid body, or into cavities; but, on the contrary, the formation of pus appears always to have been prevented. (*Gaz. Méd. de Paris*, 10 Dec., 1864.)

REMOVAL OF LARYNGEAL POLYPI BY DIVISION OF THE THYROID CARTILAGE. Drs. Ulrich and Lewin of Berlin have related a case of extirpation of a polypus of the larynx after preliminary division of the thyroid cartilage. According to Lewin, two cases only of this operation had been previously recorded; one which was performed by Ehrman of Strasburg in 1844, and another said by Pirogoff to have been performed some time ago in Heidelberg. The present case is interesting in its result, as compared with that of Ehrman. In Ehrman's case, the voice was not restored after the removal of the tumour; in that related by Ulrich and Lewin, there was perfect aphonia before the operation, but afterwards the patient was able to speak distinctly, in a somewhat deep bass voice. The patient was a girl, aged 16, who four years previously had, without any known cause, suddenly become hoarse, and at last lost her voice. On a laryngoscopic examination being made by Dr. Lewin, polypous growths, especially on the left false vocal cord, were found to be the material cause of the aphonia, and also of considerable impediment to respiration. As a preliminary measure, a cannula was, on October 8, introduced through the crico-thyroid ligament, with the effect of rendering the breathing perfectly free. On October 31, Dr. Ulrich, with the assistance of Dr. Lewin and two other colleagues, put the patient under the influence of chloroform; the thyroid cartilage was divided and held apart by blunt hooks, and the cannula was removed; the polypus, on which the light of a lamp was thrown by means of a mirror, was seized with hooked forceps and cut off by curved scissors. The polypous growths, two in number, were seated inside the laryngeal ventricle and on the false vocal cords; their bases were not broad, and it was found necessary to remove them separately. The two tumours formed together a mass, of about the size of a hazel-nut. After removal, caustic was applied to the points whence the tumours had arisen; the cannula was re-introduced, and the wound made in the operation was brought together with strips of plaster. On the third day the cannula was removed, as the patient could breathe freely through the normal passage. On November 23, the wound was nearly cicatrised, and the firmness of the larynx shewed that the divided halves of the thyroid cartilage had

united. On laryngoscopic examination, Lewin subsequently found that, in speaking, the edges of the false vocal cords became perfectly approximated and almost closed the glottis, while the true vocal cords were red and swollen, moved very imperfectly, and were far from closing the glottis. He attributes the remarkably deep bass voice of this young patient to the abnormal activity of the false vocal cords, which here acted vicariously for the true cords. (*Wiener Med. Wochenschr.*, 1 Feb., 1865.)

CLOSURE OF FISSURE OF THE PALATE. Mr. Annandale, in the *Edinburgh Monthly Journal*, describes two operations of closure of congenital fissures in the hard and soft palates, and remarks thereon that fissures of the hard palate have been successfully closed by operations in England; first by Mr. Avery, and more recently by other surgeons; but he can find no recorded account of any case in which a fissure, involving the entire hard and soft palates, has been cured by operation in Scotland. The operation performed for the relief of fissures of the hard palate, as practised by Avery, and subsequently by other surgeons, with some little alterations, consists in first paring the edges of the fissure, and then dissecting off the soft tissues from the hard palate, so as to secure a flap on each side, the inner margins of which flaps are brought together over the fissure and adjusted to one another. Langenbeck recommends that the periosteum of the hard palate should be separated along with the other soft textures, in order that the fissure may become in time closed by bone. From the nature of the soft textures over the hard palate, and from the manner in which these were separated by Avery and other surgeons, it is probable that the periosteum was thus separated by these gentlemen in their operations. Mr. Fergusson of London first suggested the division of the muscles of the palate in order to facilitate the operation for closing fissures of the soft palate, and prevent any traction on the edges of the wound during its healing. Surgeons are, however, by no means agreed as to the propriety of this proceeding, or as to the particular muscles which it is necessary to divide. Mr. Annandale considers the division of the muscles of the palate an unnecessary complication of the operation. In operating in the first case, Mr. Annandale made much freer incisions along the alveolar margins of the flaps than have, he believes, ever yet been practised in such operations. This he did because the fissure was wide and extensive, and he found that it was the only way to separate the flaps to that extent which would permit of their being brought together without any tension over the fissure. In order to avoid wounding the posterior palatine artery or its branches, the incisions were made quite on the alveolar ridge within a short distance of the free edge of the gum. The result of the first case proves that the soft tissues and periosteum over the hard palate may be almost completely removed from their connection with surrounding textures and yet may live, heal in their new position, and no injury to the bone result. In separating the periosteum and other soft textures from the hard palate, he employed the blunt instrument recommended by Langenbeck for the purpose, and much prefers it to those curved or angular knives which are generally used in this country. The bleeding during the operations was easily checked by washing out the mouth occasionally with cold water. The stitches in the soft palate were not interfered with until the ninth or tenth day after the operations. The stitches in the hard palate were removed much sooner. If the stitches in the soft palate are not causing much irritation, they should be allowed to remain even longer than ten

days, a fortnight at least. For, although the wound may be united before this, the union is not strong, and may be ruptured by excessive movements of the parts. The patients in both instances were allowed to take fluids, such as beef-tea, water, milk, or thin gruel, two or three times a day for the first ten days after the operation, and after that time a firmer diet was given, but nothing which required much mastication was permitted till the end of three weeks after the operation. The patients were confined to bed, and forbidden to talk for the first week; but at the end of this time they got out of bed for several hours daily. In a third case, he extended the alveolar incision backwards, by carrying it round the last molar tooth, still, however, keeping close to the dental margin of the gum. By this means tension may be more completely taken off the wound in the soft palate without any division of the muscles.

MELANOTIC TUMOUR OF THE ORBIT. At a recent meeting of the Pathological Society, Mr. J. Z. Lawrence exhibited a melanotic tumour of the orbit, which he had removed ten months previously from a woman aged 62. The tumour had then been growing eight or nine months. The eyeball was protruded from its socket, but not apparently enlarged itself. It was insensible to light; the interior of the eye was illuminable, but no details could be observed. The patient had suffered great pain, which she referred to the temple and side of the head. Mr. Lawrence removed the tumour together with the eyeball, which was found to be firmly embedded in its substance. The growth was enveloped in a firm pseudo-cyst of cellular tissue, and presented all the obvious and microscopical characters of melanotic cancer. The eyeball itself was quite free from morbid deposit; the vitreous body was fluid; the retina partially separated; the lens nebulous. The tumour recurred *in situ* in about three months, when Mr. Lawrence transferred the case to Mr. Weeden Cooke. The patient died in about three months afterwards; by which time the secondary tumour of the orbit had attained the size of a cricket-ball, and deposits were found within the cranium. Mr. Lawrence considered this case remarkable for the extremely acute course it had run, differing in that respect from the cases of melanotic cancer of the eye he had hitherto observed, and agreeing more with those of encephaloid cancer of the eyeball in children. In corroboration of this assertion, he instanced a second case of extensive melanotic cancer of the orbit, which he had removed some years ago; in which case no recurrence of the growth had taken place, when he saw the patient two years and four months after the operation.

PENETRATING GUNSHOT WOUND OF THE LIVER AND PLEURA. Dr. E. Batwell, of the Federal army, communicates some interesting notes on army practice. P. H. received a gunshot wound in September, the ball penetrating posteriorly and laterally between the eighth and ninth ribs of the right side, passing obliquely upward and presenting itself on the opposite side, between the seventh and eighth ribs. Considerable hæmorrhage had taken place, and the dyspnea was terrible. Air regurgitated through the wound, and some emphysema developed itself around the opening of the left side. Nothing indicated that the lung was injured. A wide bandage was applied around the thorax, leaving the wounds uncovered so as to favour the escape of any fluids. Brandy and morphia were given freely, and it was fully thirty hours before any sort of reaction set in. For four days no change seemed to take place, but on the fifth he seemed to rally and on the eighth day a large slough came away,

followed by a discharge of pure bile, which continued for several days through both openings, affording no little amusement to the patient, as on a full inspiration followed by forcible expiration, he would eject pure yellow bile to a considerable distance. He had no spitting of blood and the point of exit healed about the sixteenth day. On the thirtieth all discharge had ceased, and was transferred north about October 24th, perfectly recovered. (*Philadelphia Medical and Surgical Reporter*.)

GUNSHOT WOUND OF THE CEREBELLUM. Dr. Batwell also relates the following case. Lieutenant W. B., shot through the head on the previous day, was brought on September 2nd into hospital. He was perfectly unconscious, breathing stertorously, with a wound about one inch above the mastoid process and presenting itself on the opposite side, where the cerebral matter left no doubt as to the fact that the brain was injured. Toward evening he became conscious and very restless, complaining of "loss of vision and inability to raise his head." Toward midnight he commenced to scream, and for three weeks did so incessantly, even during his moments of sleep. Dr. Batwell removed him to a distance from the hospital, and on the 20th he became suddenly composed and quiet, answering perfectly coherently any questions asked him. The left side for some days seemed paralysed, as he could not use his hand or leg as he did the other or opposite side. The face was drawn to the right, and he seemed to have some difficulty in swallowing. The secretions were natural and he never lost control over them. He had constant priapism, with seminal emissions. All these symptoms, however, became gradually better, but as soon as he became enabled to move about, he seemed unable to guide his movements; the power of will over motion seemed lost, and for some time he was obliged to be led by his nurse. Finally this symptom became better and he convalesced rapidly. The pupil of the left eye seemed permanently dilated and intolerant of light. During the process of healing several spiculae of bone came away, but about the seventh week all discharge from the wound had ceased and he was transferred to Nashville. (*Philadelphia Medical and Surgical Reporter*.)

FRACTURE OF THE LOWER END OF THE ULNA BY INDIRECT VIOLENCE. Mr. H. J. Tyrrell relates the following case. A man, aged 60, presented himself as an out-patient at Jervis Street Hospital in Dublin on the morning of December 16th, and stated that, about ten minutes before, while getting up on a stool to clean a shop-window, he fell on his right hand. On examination, Mr. Tyrrell easily discovered a fracture of the ulna two inches from the wrist. There was little or no swelling. A distinct crepitus was felt, and the line of fracture could be easily traced; it extended from the radial side upwards and inwards. There was a hollow on the ulnar side of the forearm corresponding to the site of the fracture. There was no deformity on the radial border of the limb, neither was there the characteristic dorsal prominence of Colles's fracture. By means of an interosseous pad and a straight splint on the front of the forearm, the deformity was removed, and no extension was requisite to replace the broken ends of the bone. Mr. Tyrrell believes this case worthy of notice from its extreme rarity. That the patient fell on his hand was evident, as the palm of his hand, when he presented himself at the dispensary, was soiled from coming into contact with the wet flags of the street. (*Dublin Medical Press*, February 1st, 1865.)

Association Intelligence.

COMMITTEE OF COUNCIL: NOTICE OF MEETING.

The Committee of Council will meet at the Queen's Hotel, Birmingham, on THURSDAY, March 23rd, at Three o'clock precisely.

Business. To receive communications from the President.

To receive the Treasurer's Financial Report.

To consider a communication from Dr. Davey to the President of the Council.

To consider the Laws of the Northern Branch.

To appoint adjudicators of the Annual Prize Essay.

To fix the time of the Annual Meeting.

Any other business which may be brought forward.

T. WATKIN WILLIAMS, *General Secretary*.

13, Newhall Street, Birmingham, March 7th, 1865.

SOUTH-EASTERN BRANCH: EAST KENT DISTRICT MEDICAL MEETINGS.

The next meeting of this Branch will be held at the Ship, at Faversham, on Thursday, March 16th, 1865, at 8 P.M.

Notices of papers or cases to be communicated, should be sent immediately to the Honorary Secretary.

ROBERT L. BOWLES, L.R.C.P.

Honorary Secretary.

Folkestone, March 1st, 1865.

MEDICAL PROVIDENT SOCIETY.

At a meeting of the Council of the Metropolitan Counties Branch, held on March 7th, S. W. J. MERRIMAN, M.D., of 3, Charles Street, Westbourne Terrace, was elected a Director of the Medical Provident Society, in the room of Dr. Sieveking, resigned.

MEDICAL BENEVOLENT FUND.

SIR,—I beg to acknowledge with many thanks the receipt of £49:10:6, being the balance of the "Bowen Fund".

I am, etc.,

JOSEPH TOYNBEE, *Treasurer*.

13, Saville Row, March 7th, 1865.

BATH AND BRISTOL BRANCH: ORDINARY MEETING.

The fourth ordinary meeting of the session was held at the York House, Bath, on Thursday evening, March 2nd; R. W. FALCONER, M.D., President, in the chair. There were also present forty-one members.

New Member. Thomas Woolner, Esq., Gloucester Road, Bristol, was elected a member of the Association and of this Branch.

Papers. The following papers were then read and discussed.

1. Typhoid Fever in the Pig, illustrated by a Specimen of Ulcerated Intestinal Follicles. By W. BUDD, M.D. Two drawings, exhibiting the Intestinal Follicular Disease of the Rinder Pest, or Cattle Plague, were also exhibited by Dr. Budd.

2. Notes on a Case of Umbilical Hernia. By R. W. FALCONER, M.D.

3. Case of Fracture of Skull. By J. W. TEALE, M.A.

4. Encephaloid Cancer of the Neck. By C. S. BARTER, Esq.

Reports of Societies.

LIVERPOOL MEDICAL INSTITUTION.

JAMES HAKES, Esq., Vice-President, in the Chair.

Removal of Depressed Skull. Dr. CAMERON showed a depressed portion of skull removed from a patient who had been subject to convulsions for the last ten years of his life. The case is one of peculiar interest; and a full account of it will shortly be published.

Partial Excision of Humerus. Mr. IRVINE introduced a Crimean soldier, from whose humerus four inches of the upper portion had been removed, and gave a brief history of the case.

Fever. Mr. STEELE read a paper on the Nature and Treatment of Fever.

Dr. WHITTLE concurred generally with Mr. Steele in his remarks on the treatment of fever. As a sedative, he preferred hyoscyamus to opium; but had met with cases where the former had produced both stupor and headache. He preferred anticipating the occurrence of coma by the application of a blister to the head whenever there was much stupor. Speaking generally, he made use of stimulants; the quantity varying much according to circumstances. Some patients' friends objected very strongly to their taking spirits; and he mentioned a case where he himself administered eight glasses of whisky and water to a patient of this class in one day, who made an excellent recovery. He believed that if, in this instance, the patient had been left to the management of his friends, death would have been the result. This was quite an exceptional case; for it was seldom that he had to resort to such large quantities. Patients, particularly young ones, sometimes obstinately refuse stimulants (though the physician may think them necessary), and yet do well; in such cases, he would not press their administration over much. He agreed with Mr. Steele's remarks on purgatives; in his own practice, he frequently substituted enemata with advantage. He was not prepared to adopt Mr. Steele's views on diaphoretics, as he considered much good was done by the promotion of gentle perspiration; and he did not believe that the sweating crisis alluded to by Dr. Corrigan could possibly be produced by diaphoretics. When the sweating crisis did occur, he quite agreed that it was a most dangerous symptom; but he did not believe that this could be brought about by the use of diaphoretics, and that, therefore, this should not be brought forward as an argument against the proper use of diaphoretics in the treatment of fever.

Dr. CAMERON, after alluding to the advantages of studying the natural history of fever as the best means of advancing our knowledge of its treatment, remarked that the principle laid down by Mr. Steele consisted virtually in the treatment of symptoms. Dr. Cameron, however, considered that symptoms were, within certain limits, indications of the "efforts of nature", which tended to promote recovery; and that, hence, interference by art became necessary only when they assumed a character inconsistent with the favourable progress of the case. Dr. Cameron differed from Mr. Steele, and concurred with Dr. Marchison's views on "elimination"; and referred to the importance of the skin, bowels, and kidneys, as means of eliminating the fever-poison from the system. As to purgatives, he believed that there was, at present, an unfounded dread of this class of remedies, from the judicious administration of which considerable benefit is derived; adding,

in illustration, the good results which, in typhus, frequently followed a spontaneous attack of diarrhoea, and the milder and less fatal character of the typhoid form of fever, in which that symptom was a prominent feature. Opium, he considered, if given at the right time and in a suitable dose, was a valuable and perfectly safe remedy. He regretted that Mr. Steele had not given the Society an idea of the amount of stimulant he had found necessary; for Dr. Cameron believed that, according to the prevalent mode of treating fever, they were administered too freely, and that many a valuable life had been lost by over-stimulating. Alcohol, he regarded not as "food", but simply as a stimulant; and as a poison, when given in the large quantities he had frequently seen ordered. Given cautiously, and in moderate doses, he believed it acted beneficially. He quoted some valuable remarks and statistics, published in the *Lancet*, by Dr. Gairdner; from which it appeared that, in the Glasgow Fever Hospital, the mortality had been 17 per 100, with an average consumption per head, during the entire illness, of forty ounces (wine and spirit included); whereas, it had only been 12 per 100, with an average consumption of five ounces (wine and spirits included)—the type of the disease being nearly alike as possible.

Dr. SHEARER thought that there was a great deficiency of original observation in Mr. Steele's paper on the really essential phenomena of typhus and its complications. He feared that Mr. Steele had added very little to our knowledge of the eruption, the mode of crisis, the cardiac and pulmonary complications which so frequently embarrass the treatment, or the varied and important sequelæ which follow the disease. He again referred to the great disparity between the hospital mortality in typhus, and that observed amongst cases treated amidst the discomforts and squalor of the homes of the poor. In the Toxteth Park Workhouse Hospital, to which he had himself sent 278 out of the 581 cases tabulated below as treated in that hospital, the general average of mortality was more than double that amongst home-treated patients. Reference to the tables will shew that, under 20, the mortality in hospital was greater by one-half; between 20 and 40, it was double; from 40 to 60, it was 2½ times greater; above 60, it was greater by one-half. It might be the practice with some medical men to send the worse cases to hospital; but, under no circumstances, did he do so, as he deemed such a step, in innumerable cases, would be certain to lead to a fatal issue. Upon the whole, the cases treated by him at the patients' homes, and those sent to hospital, were as nearly similar, in all respects, as one could wish, even for the purpose of an experiment. He feared that, to the causes of this excessive hospital mortality indicated at last meeting, he must add a possible fourth; viz., the excessive and unwarrantable use of stimulants in nearly all cases of typhus, which appeared to be the rule with the majority of practitioners. As a rule, he never gave stimulants to young people under 20; and not even to adults or the aged, except there were indications of unusual depression or prostration. Wine was the principal stimulant employed, and the bulk of that was ordered for patients in the convalescent stage. The treatment consisted in the frequent presentation of light nutritious food—such as milk, beef-tea, meat-broth, with butter-milk or imperial drink *ad libitum*; frequent sponging of the exposed surfaces; quietness and free ventilation. There was little indication for the use of medicines. He had never observed either "a critical diarrhoea or diaphoresis"; when these occurred, they only complicated and delayed the crisis, which, in his experience, was a very gradual affair indeed, extending over

several days, and commencing any day, from the tenth to the fourteenth of the fever.

The following is the table of Comparative Mortality in Typhus submitted by Dr. Shearer.

	Under 20 years.	20 to 40.	40 to 60.	60 and upwards.
Liverpool Fever Hospital	4.3	16.7	36.1	50
London Fever Hospital	5.5	16.9	39.6	62.3
Netherfield Road Hospital	Average	14 per ct.	for all	ages.
Toxteth Park Fever Hospital. (581 cases; 116 deaths)	5.15	20.14	48.12	80
Dr. Shearer. (610 cases; 48 deaths)	3.3	10.0	18.18	50

The President, Mr. Higginson, Mr. T. S. Walker, and Dr. Burrows, also took part in the discussion. It was unanimously resolved that the discussion should be adjourned to the next meeting of the Society.

Mr. STEELE, in replying, thought that the indication for blistering in fever, was to rouse the brain when coma or stupor had actually appeared, rather than in anticipation of that condition, as suggested by Dr. Whittle; and as to the gentle action of the skin excited by cold affusion, it was doubtless a relief to the system; but he, nevertheless, considered that anything approaching to copious perspiration added materially to the danger of the case. Of the plan of giving one large dose of quinine once in the twenty-four hours, spoken of by Mr. Higginson, he (Mr. Steele) had no experience; but believed that the treatment of fever by cinchonism, introduced by Dr. Dundas, had been abandoned as useless, after careful trials by Tweedie, Corrigan, and others. He did not, as Dr. Cameron seemed to imagine, reject the use of diuretics under all circumstances; but thought that they were likely to do harm rather than good, where the kidneys were involved in that condition of hypostatic congestion of all the internal organs which characterised certain states of the system in typhus. Purgatives, also, might be useful to remove accumulation in the bowels; but he objected to their use as eliminants of the fever-poison, thought extreme caution was necessary in their administration, and believed, with Dr. Whittle, that enemata might often be substituted with advantage. He had purposely avoided stating any precise rule as to the quantity of stimulant which should be given, as it entirely depended upon the indications present in individual cases, and could only be determined at the bedside. Many cases, especially those under puberty, might require no alcohol at all; others demanded large quantities and large doses. Hence, the impossibility of settling this question by statistics. The only safe guide in the use of stimulants, was close observation of the lesion of circulation, as shown by the pulses of the heart and wrist, and the extent and colour of the eruption. When, under stimulation, we found the pulse increase in force and the maculae become less livid, we might feel sure alcohol was doing good. He had repeatedly given as much as twelve ounces of brandy in twenty-four hours, with the evident result of saving the patient's life, and without causing any of those serious lesions in the alimentary canal, which Dr. Burrows had described as the effect of alcoholic treatment. He coincided in Dr. Cameron's view, that alcohol was not food, but a stimulant only, which was at once carried out of the circulation without undergoing digestion; and hence its great value in that condition of the function of nutrition in which the assimilative function was suspended or deranged. As to Dr. Shearer's remark, that nothing

had been said about the characteristics of the eruption, he would simply reply that he was not giving a clinical lecture; but directing attention to certain points especially interesting to practitioners who were familiar with the symptoms of fever. In answer to the President's inquiry, as to his experience in the use of digitalis, he had not seen it tried in fever; and, although believing with Dr. Handfield Jones that in some forms of heart-disease that drug acted as a cardiac tonic, he could not think it was a suitable remedy in the generality of fever cases. In stating as an objection to the use of alcohol, that it increased thirst, Dr. Burrows ignored the well known fact that in the advanced stage of typhus, the sensation of thirst was entirely absent. The return of desire for fluids was, in fact, a favourable sign, indicating a less grave lesion of the function of innervation. In conclusion, he read a letter from Dr. Wm. Budd, fully endorsing the views advocated by the author in the former portion of his paper, as to the erroneous doctrines of the *de novo* production of fever, and as to the higher relative rate of mortality in fever hospitals.

OBSTETRICAL SOCIETY OF LONDON.

WEDNESDAY, FEBRUARY 1st, 1865.

ROBERT BARNES, M.D., President, in the Chair.

Two ordinary Fellows were elected.

Specimens. Dr. BATHURST WOODMAN exhibited specimens of Chancre and Fibrous Tumours of the Uterus.

Dr. GREENHALGH exhibited a Polypus weighing upwards of a pound and three quarters, which he had removed from the uterus of a woman 40 years of age by means of a pair of curved scissors. The author insisted on the necessity for cutting away these growths, and the desirability of removing them *in situ*, rather than making forcible traction on the uterus for the purpose of bringing them within easy reach of the operator.

ON A NEW METHOD OF SECURING THE PEDICLE IN OVARIOTOMY. BY I. B. BROWN, ESQ.

The author observed that hitherto there had been three distinct methods of securing the pedicle: first, by ligature, allowing the ends to hang out, as practised by Dr. Clay of Manchester (the pioneer of ovariectomy in this country, who had steadily led us on to our present results), and by Lane (the first surgeon in London who performed this operation) consecutively; secondly, by clamp, as first suggested by Hutchinson, and followed by many others; thirdly, by cutting off the ligature short and closing the wound, as first successfully practised by Rogers of New York in 1829, by Dr. Bellinger in America in 1835, by Dr. Siebold of Darmstadt in 1846, and recently by Dr. Tyler Smith. The first three gentlemen's cases were all successful, and the last-named gentleman has also had great success. Mr. BROWN said that his objections to the first method had been the length of time required for the ligature to come away, which varied from nine days in his own practice to a month in that of others; to the second, the frequent severe pain caused by the dragging of the pedicle, or the pressure of the clamp itself; to the third, the unsuccessful results in his hands following its use. Having repeatedly used the actual cautery of late, employing Dr. Clay's instruments, in burning adhesions off the omentum and elsewhere, he had been gradually led to the conclusion that the actual cautery might be employed in treating the pedicle itself. Consequently, on December 28th, 1864, he tried it upon a patient of Dr. Burchell, of the Kingsland Road, a lady 47 years of age, who had had three

children, the youngest twenty-one years since. The disease was first discovered by Dr. Burchell in August last, and so rapidly increased as to lead Dr. Barnes and Dr. Tanner to recommend extirpation some short time before he (Mr. Brown) saw her. As the abdomen then was very large, the skin shiny, and the general health rapidly suffering, he performed the operation by Clay's large incision. There were many adhesions laterally and posteriorly, the bleeding from which was checked by the actual cautery; and finally the pedicle, being secured by a clamp, whilst a very large multilocular mass of cysts was removed, was thoroughly seared by actual cautery and allowed to drop. The wound was then closed in the usual way, and it healed in a week, the patient being convalescent in a fortnight. Mr. Brown thought that if this plan was found by repetition to be successful, it would very materially lessen the dangers of the operation, and consequently ensure a greater number of recoveries.

Dr. ROUTH stated that Mr. Brown's previous and successful experiments in the removal of the omentum by a red-hot iron would prove the best reply to Dr. Tyler Smith, as to the probable conduct of the peritoneum where a pedicle was removed in the same manner.

Mr. BROWN, in reply to several speakers, said that the objection urged by Dr. Tyler Smith, of the slough being injurious to the peritoneum, had been answered by the questions put by Dr. Routh and replied to by Dr. Greenhalgh; that he (Mr. Brown) had, for four years past, repeatedly used the actual cautery in burning adhesions and arresting hæmorrhage, and in no one of the cases so treated had he had a death; and he thought that the objection ought not to deter others. He did not allude to the *écraseur*, because he thought that there was not sufficient time in ovariectomy to use it safely; and he did not think it probable that it would ever come into use on that account. In answer to an objection that white heat might be detrimental, Mr. Brown said he did not go quite so far as to use white heat, but he stopped just short of it. To the objection of Dr. Parsons, that there was fear of hæmorrhage in case of sickness after the use of the cautery, Mr. Brown replied that whilst it was well known that many patients had died from hæmorrhage where the ligature was used, he did not think, judging from his past experience and the results of veterinary surgeons in spaying the sow, that there was any probability of hæmorrhage where the cautery was steadily and thoroughly applied.

PRESIDENT'S ADDRESS.

The PRESIDENT acknowledged the honour conferred upon him by the Society. In this election, he said, the Society had followed the principle under which it had attained its present position of unexampled prosperity—namely, that of recognising work. He adverted to the success the Society had thus achieved in linking itself to fellow-workmen in all parts of the world, and trusted that the Society would be the means of challenging for English midwifery that place in the republic of medicine which it eminently deserved. English midwifery presented the singular characteristic, that it was based upon home or domiciliary practice; whilst elsewhere it was mainly dependent upon lying-in hospitals. The Society had therefore the charge of vindicating home midwifery, of showing that it afforded ample means for observation and for advancing obstetric knowledge. The main argument urged by the advocates of the hospital system was, that hospitals were necessary for instruction. But home practice in England still asserted a practical superiority in its eminent success. He cited Harvey; the Chamberlens, the reputed

authors of the forceps; Edmund Chapman, who first taught the use of that instrument; Sir Fielding Ould, who laid the foundation of our knowledge of the mechanism of labour; Giffard; Smellie; William Hunter; Denman; Macaulay, the first to practise the induction of labour; Perfect; and the first Rigby, who, as a country practitioner, made those observations and drew those classical descriptions of uterine hæmorrhage which are still revered for their truthfulness and sagacity. The President then expressed his belief that physicians and statesmen abroad would be impelled to re-examine the great question of the expediency of taking parturient women away from their homes. The provisions for the study of uterine pathology in our English schools were then discussed. Recently a new department had been instituted in our educational hospitals for this purpose. But the position and duties of the "obstetric physician" remained still undefined. The President submitted the following proposition:—"The work of the obstetric physician embraces the treatment of the diseases of the female generative organs, including the disorders and lesions, general and local, which result from pregnancy and parturition." Of course, in founding a new special department, something must be taken both from the physician and the surgeon. If the obstetric physician were to enjoy any status at all, it could only be on this condition. The difficulty in adjusting relations arose chiefly on the surgical side, probably because it seemed an anomaly for a man bearing the title of a physician to be meddling with surgery. But in point of fact the obstetric practitioner was necessarily a compound of the physician and the surgeon; his surgical character was implied in the word "obstetric." Custom which imposed upon him the general title of physician could not alter the nature of his functions. Just as the study and treatment of the diseases and lesions of the generative organs had been neglected until taken up by obstetric practitioners, so they would be again if abandoned by us. It was to obviate this neglect, to encourage the study, that the new appointment was made. To make the office and to cut off the very material for study was inconsistent. As an illustration, there was the modern appointment of an ophthalmic surgeon to our hospitals. It was given to surgeons; but they treated all diseases of the eye, even including those of constitutional nature, which physicians had always treated. If the surgeon said, "The obstetric physician must give up all operations," the physician might as reasonably say, "The obstetric physician must give us all that requires medical treatment"—for example, puerperal fever, which is not more a consequence of labour than is a slough of the vagina resulting in cicatricial atresia or vesico-vaginal fistula. This reasoning would simply lead to the annihilation of the obstetric practitioner, and is a manifest *reductio ad absurdum*. The President then called upon the Fellows to imitate the example of the Royal College of Physicians and the Royal Medical and Chirurgical Society, by opening a corporate album for the preservation of photographs of their Fellows.

POPULATION OF SCOTLAND. According to the tenth report of the Registrar General of Scotland, just issued, the population of that kingdom, estimated to the middle of July, 1864, was 3,118,701. The births were 112,445, being in the ratio of 3.60 per cent. to the population, and among them 11,069 or 9.8 per cent., were illegitimate. The deaths were 74,301, and the marriages 22,675. These numbers are respectively in the ratio of 2.35 and 0.72 per cent. to the population.

Correspondence.

DR. RICHARDSON'S SUGGESTION FOR THE TREATMENT OF OVARIAN TUMOURS.

LETTER FROM T. SPENCER WELLS, Esq.

SIR,—Any suggestion from Dr. Richardson is so certain to be received with attention, and so likely to be carried into practice on the mere support of his authority, that I think it right to point out without delay how very great must be the danger, if his "Suggestion for the Treatment of Ovarian Tumours by Compression, and Obliteration of the Tumour at its Base or Pedicle", published at page 221 of your last number, should lead any one to treat an ovarian tumour in the manner which he has suggested. Indeed, I hardly think it possible that a patient could survive such compression of the pedicle as he proposes; for the necessary result of suddenly cutting off the supply of blood to the tumour, would be death of the tumour, or gangrene, just as certainly as the twisting of the pedicle which occasionally occurs during the natural progress of ovarian tumours is followed, in the great majority of cases, according to its completeness or suddenness, by simple venous congestion of the tumour, rupture of its vessels and hæmorrhage (sometimes enough to cause sudden death), degeneration of the extravasated blood, inflammation of the coats of the cysts, and fatal peritonitis.

It is quite true that, in some rare instances where the pedicle is very long, the spiral manner in which the Fallopian tube is wound round the blood-vessels of the pedicle proves that twisting may take place without any great compression of the vessels; and that, in some even rarer cases, a more complete but gradual twisting and compression has led to just that atrophy or shrinking of the cyst which Dr. Richardson thinks might possibly be attained by a ligature or by acupressure—the ovary being found converted either into a harmless solid body; or into a calcified capsule; or into a cartilaginous or bony foreign body, fixed in any part of the abdominal or pelvic cavity by adhesions or false membranes. In some cases—as in my 119th case of ovariectomy, recorded in the first volume of my work on *Diseases of the Ovaries*—the pedicle may be entirely severed from its connection with the uterus, and yet the tumour may not die; but may receive a sufficient supply of blood for its rapid growth from the omental or mesenteric vessels.

But this must be a very slow process; and I feel convinced that any sudden and complete compression of the pedicle of an ovarian tumour by such a surgical operation as is suggested by Dr. Richardson, would, in the vast majority of cases, be followed by the same fatal consequences as follow the sudden and complete twisting of the pedicle of an ovarian tumour by any such rotation as is occasionally observed to be one of the modes by which these tumours prove suddenly fatal.

I am, etc.,

T. SPENCER WELLS.

3, Upper Grosvenor Street, March 6th, 1865.

TREATMENT OF OVARIAN TUMOURS.

LETTER FROM B. W. RICHARDSON, M.A., M.D.

SIR,—By a note which I have received from my friend Dr. Tanner, I find that my suggestion for ligature of the pedicle of ovarian tumours is not purely original, but has been suggested by him for

cases in which the tumour is adherent. The following is the proposed method of Dr. Tanner, from *Druitt's Surgeon's Vade Mecum* (8th edit., p. 499.)

"There is another operation of fair promise, which has been proposed by Dr. Tanner, for cases in which the presence of extensive adhesions renders it impossible to remove the cyst. This consists in tying tightly the pedicle of the tumour after the fluid has been removed by tapping. Thus it may be hoped, that whilst the supply of blood furnished to the cyst by its adhesions will be sufficient to prevent gangrene, the obstruction of the main arterial channel might prevent the fluid from being secreted anew."

I hasten at once to give full credit to Dr. Tanner for his originality. At the same time, I do not think, as he does, that extensive adhesions are necessary for the operation to be successful. If there were such vascular connexion between the sac and the surrounding tissues as would keep up the nutrition, the blood-supply by adhesion would soon increase, and the sac would in time secrete fluid as freely as though the pedicle were not tied. My view regarding the operation is quite different from Dr. Tanner's, although the operation of compressing the base of the tumour is the same. I conceive that, if the tumour were tied and emptied, especially if it were tied without exposure to air, the cyst would shrink, and would not become gangrenous. I have known a farrier produce, by a very rude operation, shrinking and destruction of the testicle in animals, by compression of the vessels, without the occurrence of gangrene; and I infer, therefore, that the ovarian cyst could be destroyed in a similar way. To prevent the hazard of gangrene, it might be advisable, however, after emptying the cyst, to inject into it tincture of iodine. In the presence of iodine, absorption would be greatly quickened, and decomposition prevented.

I am, etc., B. W. RICHARDSON.

12, Hinde Street, W., March 7th, 1865.

THE SOCIÉTÉ MÉDICO-PSYCHOLOGIQUE OF PARIS AND THE TOWNLEY CASE.

LETTER FROM C. L. ROBERTSON, M.D.

SIR,—May I be allowed to write one line more on the Townley case? I am almost ashamed to recur to the subject; yet I think the point to which I am about to refer should be set right.

Of the merciful verdict of the jury, you well remark in one of your leaders last week, that "if any of these men of science who considered Townley a lunatic murderer can find a comfortable confirmation of their opinion in his self-murder, no one need wish to deprive them of such consolation"; nor have I any wish to rob Dr. Forbes Winslow of your suggested consolation under his recent discomfiture. His indiscreet friends in the *Lancet* oblige me, however, to say, that the paragraph quoted there last week from the *Gazette des Hôpitaux** gives quite a false impression of the action of the Société Médico-Psychologique in the matter. So far it is true, that certain members of the Society got a Committee appointed to consider and report on the Townley case. *Wiser*

counsels, however, prevailed, and the Townley Committee made no report. Since Townley's suicide, another strenuous effort has been made from London to revive the action of this Committee. Again, a sense of the unseemliness of thus sitting in judgment on the diagnosis of men like Drs. Bucknill, Hood, Meyer, and Hitchman, without even the means of examining the patient, has prevailed; and I have reason to know that the subject will not be brought at all before the Société Médico-Psychologique.

Further, in the paragraph quoted in the *Lancet* from the *Gazette des Hôpitaux*, the first sentence is omitted. I subjoin it.

"Il y a quelques mois, la *Gazette des Hôpitaux* a annoncé que la Société Médico-Psychologique de Paris avait été consultée au sujet de l'état mental du gentleman G. Townley, condamné à mort pour avoir assassiné sa fiancée, et à l'exécution du quel il avait été sursis. Cette savante compagnie", etc.

Who, I should like to know, consulted the Société Médico-Psychologique? The act looks to me very like an unsuccessful attempt to entrap the French Psychological Society into an approval of a diagnosis condemned alike by the general and medical press of England—the *Lancet* excepted. Be that as it may, I am thankful to know that this distinguished Society has not suffered itself thus to be misled.

I am, etc., C. L. ROBERTSON, M.D.,
Membre-associé Etranger de la Société Médico-Psychologique.

Hayward's Heath, March 7th, 1865.

POOR-LAW MEDICAL REFORM.

LETTER FROM RICHARD GRIFFIN, ESQ.

SIR,—I shall feel obliged by your giving insertion to the accompanying letter, in order that the Poor-law medical officers may know that I am not unmindful of their interest. During the last three months, I have been in correspondence with members of Parliament; but, in the face of a general election, there is evidently an indisposition to bring in a Bill for medical relief. One M.P. writes: "I shall see Mr. Villiers on the subject of your bills, and see what support we may expect from that quarter"; and, in a postscript, adds: "I feel that it would be next to useless to attempt the passing of a bill or bills unless the Government would give some support. Unfortunately, the profession is so disunited that all Governments can take advantage of us in our individual exertions—not so the law." From this gentleman I have not heard since January 31st, the date of the above letter, although I have addressed three letters to him.

I am, etc.,

RICHARD GRIFFIN.

12, Royal Terrace, Weymouth, March 7th, 1865.

"12, Royal Terrace, Weymouth, March 6th, 1865.

"My Lords and Gentlemen,—On the 2nd of Sept., 1864, I had the honour to receive a letter from you, in which you say: 'The Poor-law Board beg to inform you that the subject to which you refer has been under their consideration; but that they have not yet come to a decision as to the measures which it may be desirable to recommend the guardians of the different unions to take, with reference to the resolution of the Select Committee on Poor Relief as regards the supply of expensive medicines. The question, however, will receive the attention of the Board forthwith.'

"It is now just twelve months (March 11th, 1864) since the Select Committee on Poor Relief recommended 'that in future cod-liver oil, quinine, and other expensive medicines, shall be provided at the

* "THE TOWNLEY CASE. After alluding to the commission that was appointed by the Société Médico-Psychologique de Paris to investigate into the alleged insanity of George Victor Townley, the *Gazette des Hôpitaux* says:—'Cette savante compagnie avait chargé MM. Jules Falret, Brierre de Boismont, et Legrand du Saulle, d'examiner avec un grand soin cette importante affaire, qui passionnait au plus haut degré la presse anglaise. La mission de nos confrères se trouve terminée: 'G. Townley vient de se suicider dans sa prison sous l'influence de sa folie,' dit le *Times*. Ce dénouement donne complètement raison à l'opinion médico-légale que M. le Docteur Forbes Winslow avait soutenue devant le jury.' (*Lancet*, March 4th.)

expense of the guardians, subject to the orders and regulations of the Poor-law Board; and six months have elapsed (Sept. 2nd, 1864) since your honourable Board said, 'The question, however, will receive the attention of the Board forthwith'; and yet no order has been issued. I, therefore, trust you will not think I am too pressing in urging this question again upon the immediate attention of your honourable Board. If you are in any difficulty about the matter, and desire to have a deputation of medical officers to confer with you on the subject, I will willingly call them together for the purpose on any day you may name, after allowing me two clear Saturdays to intervene, as it is only through the medium of the medical journals that I can announce the fact to them.

"I was in hopes your honourable Board would bring in a Bill this session to regulate the payments of your medical officers; and not allow the present capricious mode of fixing the salaries, and giving some officers extra medical fees and others none, to continue.

"It is perfectly clear, from the several amendments of the Select Committee, that the Committee itself was far from being unanimous on the subject of medical relief; and even their ultimate decision, 'that there are no sufficient grounds for materially interfering with the present system of medical relief', clearly proves that there are grounds for interfering, although not materially doing so. I, therefore, trust your honourable Board will yet place the whole system on a proper footing.

"I have the honour to be,

"My lords and gentlemen,

"Your most obedient servant,

"RICHARD GRIFFIN.

"The Poor-Law Board."

DISEASES IN CATTLE. In the House of Commons, on Monday, Mr. Leslie asked whether or not the Government intended to re-introduce the Cattle Diseases Prevention and Cattle, etc., Importation Bills as amended by a Select Committee of the House last session. Mr. T. G. Baring said the Select Committee of last session recommended that the House should not proceed with the Cattle, etc., Importation Bill. With regard to the Cattle Diseases Prevention Bill, such difference and even conflict of opinion was exhibited before the Committee, that the Government did not intend to introduce any measure on the subject.

SOUTH AMERICAN BEEF. W. Wylde, a sanitary inspector, applied on Monday to the Lord Mayor for an order for the condemnation of a quantity of South American beef. He said that in the shop of Mr. Twelvrees he saw about 2cwt. of dried meat advertised as South American beef. It was unfit for human food. He could not say whether it was beef, or indeed, meat at all. It was cut in strips, and was in the shop with other meat. Witness said that numerous complaints had been made about South American beef by the poorer classes, who said that it spoiled everything it touched. Witness could not say whether the meat he seized was horseflesh or cow beef, or what it was. He did not believe it was the flesh of a bullock at all. Sanitary Inspector Newman considered the meat which had been seized entirely unfit for human food. He had tried to boil part of it, wishing to give it a fair trial, and had been obliged to carry the saucepan containing it out of the house. They had seized about 25cwt. of meat of the same kind in another shop on Friday. The Lord Mayor, after inspecting the meat for himself, ordered it to be destroyed forthwith, as being unfit for human food.

Medical News.

ARMY MEDICAL SERVICE. The following is a list of the candidates who were successful at the Competitive Examination in August last, and who have passed through a course at the Army Medical School; and shows the combined results of the examination, the place of study, and the number of marks obtained by each candidate.

Names.	Studied at	No. Marks.
Jameson, W. H.	Edinburgh	5247
Harvey, R.	Aberdeen & Glasgow	5020
Whipple, J. H. C.	London	4813
Cleghorn, J.	Edinburgh	4640
Tomlinson, W. W.	Dublin	4545
Priest, W. S. M.	Dublin	4497
Duffey, G. F.	Dublin	4490
Bennett, J.	London	4369
O'Dwyer, T. F.	Cork	4310
Boileau, J. R. H.	Dublin	4305
Cook, H.	Cork	4302
Carpenter, W.	Dublin & Galway	4295
Campbell, G. McL.	Aberdeen	4202
Foster, J. F.	London	4190
Farquharson, R. A.	Aberdeen	4160
Keir, W.	Aberdeen	4040
Corban, L.	Cork	3925
Tuite, F.	Dublin	3925
Taylor, W.	Glasgow	3895
Smith, P. A.	Cork	3887
Shepherd, P.	Aberdeen	3882
MacLean, J. McK.	Edinburgh	3855
Power, P. G.	Cork	3855
Hedley, W. T.	Edinburgh	3793
Purcell, T. A.	Dublin	3782
Kemp, R. D.	Aberdeen	3756
Handy, S. W.	Dublin	3705
O'Sullivan, E.	Dublin & Cork	3699
Hale, A. E.	Birmingham	3690
MacCreery, J.	Dublin	3646
Gillespie, H. C.	Cork	3630
Spurway, C.	Cork	3580
MacCounell, W.	Dublin & Belfast	3528
Hector, J.	Aberdeen	3520
Eames, W. L.	Cork & Edinburgh	3512
Shaw, C. E. M.	London	3494
Dunn, A.	Dublin	2490
Stone, V.	Edinburgh	3469
Macam, K.	Belfast & Glasgow	3460
Riordan, W. E.	Dublin	3426
Bourke, T.	Dublin	3417
Murray, J.	Aberdeen	3405
Kelly, J. B.	Dublin	3399
Bouras, D. C. G.	Dublin	3397
Welsh, J. F.	Edinburgh	3396
Hughes, J. H.	Galway & Dublin	3337
Jones, J. W.	Dublin	3331
Walker, S. E.	Birmingham	3292
Blake, J. F.	Dublin	3290
Robinson, A. B.	Dublin	3284
Thorburn, D. A. S.	Edinburgh	3247
O'Brien, E. R.	Cork & Dublin	3178

Jagoe, W. H.	Dublin	3170
Blake, W.	Dublin	3163
Smith, C.	Dublin	3135
Duby, J.	Dublin	3116
Haward, E. T.	London	3097
Grosse, D. C.	Dublin	3040
Dickinson, F. F.	Galway & Dublin	3040
Barrie, A.	Glasgow	3038
Dodge, S.	Belfast	3027
Flood, S.	Dublin	3000
West, G. B.	Dublin	2993
Canny, D. J.	Dublin	2975
Vallance, E.	London	2969
Candy, J.	London	2861
Ryan, J. B.	Dublin	2785
Hutchinson, C. F.	Dublin	2735
Fustace, E.	Dublin	2705
Peatfield, T. J.	London	2693
Coulter, J. R.	Dublin	2619
Blackhouse, C.	Dublin	2600
Ward, E.	Dublin	2581
Maturin, J.	Dublin	2537
Reuton, D.	Edinburgh	2453
Healy, C.	Dublin	2392

BIRTH.

COOMBS. On February 13th, at Devonshire Place, Wandsworth Road, the wife of S. Coombs, Esq., Surgeon, of three daughters.

MARRIAGE.

*ARNISON, Charles, L.R.C.P.Ed., of Alston, Cumberland, to Margaret, youngest daughter of the late John Dickinson, Esq., of Newcastle-upon-Tyne, at Newcastle, on February 28.

DEATH.

*PLIMMER, George, L.R.C.P.Ed., at Melksham, Wiltshire, aged 63, on March 1.

MR. CLOVER has been appointed to administer chloroform at the Westminster Hospital.

NEW LUNATIC ASYLUM. Ayrshire is to have a new lunatic asylum, its estimated cost being £17,500.

BEQUEST. By will W. Jaffray, Esq., of St. Mildred's Court, Poultry, has left to University College, £2,000.

SUCCESSFUL OPERATIONS. During the last two or three months, all the operations, seven in number, of strangulated hernia, performed at St. Mary's Hospital, have been successful.

THE DREADNOUGHT HOSPITAL. The *Dreadnought*, it has been decided, shall cease to be used as a hospital ship. In its place, a suitable and convenient building is to be erected on the side of the river.

CESAREAN SECTION. Dr. Wiblin lately performed the Cesarean operation at Southampton, in a case of deformed pelvis. The woman died twenty-five hours after the operation.

ANONYMOUS CHARITY. During the last week a lady, who declined to give any name, paid into the hands of the treasurer to the Royal Free Hospital, £1,000 towards the funds of that charity.

PRESENTATION TO PROFESSOR LUDWIG. The students of Vienna have presented Professor Ludwig with a large silver cup, as a mark of their gratitude to him, on the occasion of his leaving for Leipzig, the scene of his future labours.

TESTIMONIAL TO DR. PINCHARD. A tea-service has been presented to Dr. Pinchard of Cottenham, in Cambridgeshire, by his neighbours, inhabitants of the villages of Milton, Waterbeach, and Landbeach, as a testimonial of their high esteem of him.

HEALTH OF THE METROPOLIS. The deaths in London returned for the week were 1482. Eleven persons were registered as having been killed by horse-conveyances. Seven persons died at the age of 90 years and upwards; the oldest was 96 years of age, and was a pensioner of Greenwich Hospital. A labourer died from "poisoned condition of blood", in consequence of having been employed in white-lead works.

UNIVERSITY OF LONDON. At a late meeting of the Medical Subcommittee of the Annual Committee of Convocation of the University of London, the following resolution, proposed by Dr. Maudsley and seconded by Dr. Sibson, was carried: "That it is desirable that a certificate of having attended a course of clinical instruction in mental diseases should be required from all candidates for the Second M.B. Pass Examination; and that the examinations should necessarily embrace the subject of insanity."

THE ROYAL HOSPITAL FOR INCURABLES has celebrated its ninth anniversary. Mr. G. J. Göschen, M.P., presided. The institution was founded by the late Dr. Reed, in 1854, and was expressly designed for that class of persons who need it most. All incurables who are not rich enough to be properly cared for in their own houses, and who are not poor enough to be ranked with paupers in the union-houses, are the proper subjects for the Royal Hospital for Incurables. The Chairman stated that a new wing had been added to the building. A long list of subscriptions amounting to upwards of £4,000 was read.

McGILL COLLEGE. The attendance of students at the University of McGill College in Canada this session is in excess of any previous year, notwithstanding the absence of a number who, last year, passed their primary examination, and are now serving in the Northern Federal army as assistant-surgeons.

A SURGICAL PATENT. Under the head of notices of patents we find the following:—T. J. Ashton, Cavendish Square, "An improved portable pneumatic apparatus, applicable in surgery and medicine for all purposes, as a douche for affusion, irrigation, injection, and for enemata."

PROFESSIONAL EXAMINATIONS. The next preliminary examination in the subjects of general education will take place at the Royal College of Physicians on the 28th and 29th inst.; and at the Royal College of Surgeons, probably in June next. At the latter institution, the next primary or anatomical and physiological examinations for the present session will take place on Saturdays, the 8th, 15th, and 29th April; and the pass or surgical and pathological examinations for membership, on the 22nd of April and 6th of May. The examinations for the fellowship will take place, as usual, in May next, about which time the Midwifery Board will meet.

NETLEY HOSPITAL. In the House of Lords, on Monday last, Lord Dalhousie called attention to the condition of the Military Hospitals at Netley and Woolwich. He detailed the circumstances under which Netley Hospital was erected, at the close of the Crimean war; and contended that in every respect it had proved most successful. It was intended for the reception of invalid soldiers returning from foreign stations, or the colonies, and suffering from wounds or the effects of climate. The site of the hospital had been described as unhealthy, and strong efforts had been made to defeat the objects of the establishment. But those efforts had failed; and, from a recent inspection of the building, he was satisfied it answered its purpose admirably. The condition of the new hospital at Woolwich, on the contrary, he thought very unsatisfactory. It was not suited to the purposes either of a general or regimental hospital. It was some distance from the garrison, and from the residences of the medical officers; while the old Woolwich Hospital was quite sufficient for the sick of the garrison. As invalid soldiers were always landed at Gravesend, they had to be conveyed to Woolwich in small steamers; and the only spot where they could be put on shore there was the landing-place at the arsenal, two miles from the hospital. He stated other objections to the building, and condemned the practice of adopting too exclusively the advice of civilians in matters of military hygiene. The Government would avoid many errors, if it would be guided by the opinion of the military medical officers. Lord De Grey admitted that the hospital at Netley had proved successful, and thought it would be better to suspend opinion as to the establishment at Woolwich till it had been tested by use. He pointed out that many of the evils discovered during the Crimean war had arisen from a too rigid adherence to the regimental system. It therefore became expedient to establish the general hospital at Netley. But, in case of war, one establishment of the kind would not be sufficient. A second general hospital had, therefore, been built at Woolwich. As to the system of consulting civilians on matters relating to the health of the army, it had been found advantageous; and he did not think the time had yet arrived when it could be dispensed with. Lord Ellenborough said the one great object to be kept in view in building a hospital was the health of the inmates. This, he feared, was not always the

case. Soldiers, too, were bound to take some care of their own health. If, when properly told what to do, they defied the rules of common sense, they must suffer accordingly. The Duke of Cambridge thought that expensive fittings, both in hospitals and barracks, should be avoided, though questions as to damages by the soldiers had recently been very liberally treated by the Government. He bore testimony to the success of Netley Hospital.

OPERATION DAYS AT THE HOSPITALS.

MONDAY.....Metropolitan Free, 2 P.M.—St. Mark's for Fistula and other Diseases of the Rectum, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.
TUESDAY....Guy's, 1½ P.M.—Westminster, 2 P.M.—Royal London Ophthalmic, 11 A.M.
WEDNESDAY...St. Mary's, 1 P.M.—Middlesex, 1 P.M.—University College, 2 P.M.—London, 2 P.M.—Royal London Ophthalmic, 11 A.M.—St. Bartholomew's, 1.30 P.M.
THURSDAY....St. George's, 1 P.M.—Central London Ophthalmic, 1 P.M.—Great Northern, 2 P.M.—London Surgical Home, 2 P.M.—Royal Orthopaedic, 2 P.M.—Royal London Ophthalmic, 11 A.M.
FRIDAY.....Westminster Ophthalmic, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.
SATURDAY....St. Thomas's, 1 P.M.—St. Bartholomew's, 1.30 P.M.—King's College, 1.30 P.M.—Charing Cross, 2 P.M.—Lock, Clinical Demonstration and Operations, 1 P.M.—Royal Free, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.

MEETINGS OF SOCIETIES DURING THE NEXT WEEK.

MONDAY. Royal College of Surgeons of England, 4 P.M. Professor Huxley, "On the Structure and Classification of the Mammalia."
TUESDAY. Royal Medical and Chirurgical Society, 8.30 P.M. Mr. Southam (Manchester), "Anastomosis by Anastomosis of the Sculp, treated by Setons and Ligation of the Common Carotid"; Dr. Hillier, "On Congenital Hydronephrosis."—Anthropological Society of London, 8 P.M.
WEDNESDAY. Royal College of Physicians, 5 P.M. Dr. Peacock. Croonian Lectures. "On some of the Causes and Effects of Cardiac Disease."—Royal College of Surgeons of England, 4 P.M. Professor Huxley, "On the Structure and Classification of the Mammalia."
FRIDAY. Royal College of Physicians, 5 P.M. Dr. Peacock. Croonian Lectures. "On some of the Causes and Effects of Cardiac Disease."—Royal College of Surgeons of England, 4 P.M. Professor Huxley, "On the Structure and Classification of the Mammalia."

TO CORRESPONDENTS.

* * * All letters and communications for the JOURNAL, to be addressed to the EDITOR, 37, Great Queen St., Lincoln's Inn Fields, W.C.

COMMUNICATIONS.—To prevent a not uncommon misconception, we beg to inform our correspondents that, as a rule, all communications which are not returned to their authors, are retained for publication.

CORRESPONDENTS, who wish notice to be taken of their communications, should authenticate them with their names—of course, not necessarily for publication.

APPARATUS FOR CLEFT-PALATE.—SIR: The object of my introducing the patient with the apparatus for cleft-palate, before the Odontological Society, is not made apparent in your JOURNAL of the 25th ultimo. It was simply to afford the Society an opportunity of judging what improvement would take place after the apparatus had been worn for some time. The members having now seen the patient in his original state, will be able to form a just opinion of the improvement in articulation produced by the use of the apparatus, as it is of course my intention to exhibit him to the meeting upon a future occasion. It is true that the apparatus was placed in the patient's mouth upon that occasion; but it was only to show the facility with which it could be worn on its first introduction.
I AM, etc., ROBERT RAMSAY,
65, Wimpole Street, Cavendish Square, March 2nd, 1865.

P.S.—The patient may be seen at my house any day by any one interested in the matter.

COMMUNICATIONS have been received from:—Mr. T. PRIDGIN TEALE, JUN.; Dr. WOODFORD; Dr. C. L. ROBERTSON; Mr. R. S. FOWLER; Dr. W. H. D. SANKEY; Dr. DURANT; Dr. HORACE DOBELL; Mr. A. B. STEELE; Dr. HENRY SIMPSON; Mr. WATKIN WILLIAMS; Mr. T. M. STONE; Mr. R. GRIFFIN; Mr. T. SPENCER WELLS; Mr. J. Z. LAURENCE; THE HONORARY SECRETARY OF THE ROYAL MEDICAL AND CHIRURGICAL SOCIETY; Mr. HENRY LEE; Mr. HARRISON; Mr. PICK; Mr. TOYNEE; Mr. JONATHAN HUTCHINSON; and Mr. F. MASON.

BOOKS RECEIVED.

1. Answers to Various Objections against Acupuncture. (From Dr. Simpson's "Acupuncture.")
2. Photographs of Diseases of the Skin. By A. B. Squire, M.B. Lond. No. XII: Lupus. London: 1865.
3. Sanitary Statistics of Cheltenham. By Edward T. Wilson, M.B. London: 1865.
4. On Some Malformations of the Organs of Generation. By Wm. Turner, M.B. Edinburgh: 1865.
5. The Twenty-Ninth Annual Report of the Canterbury Dispensary.
6. The Modern Practice of Medicine: A Lecture delivered before the Royal College of Surgeons. By D. Rutherford Haldane, M.D. F.R.C.P. Edinburgh: 1865.
7. Lecture on Perfumes. By Septimus Piesse. London: 1865.

ADVERTISEMENTS.

ESTABLISHED 1848.

MEDICAL TRANSFER & PROFESSIONAL AGENCY,
50, Lincoln's-inn-fields, W.C.

Mr. J. Baxter Langley, M.R.C.S.

(KING'S COLL.), begs to inform the members of the Medical Profession that he has undertaken the Medical Transfer and General Professional Agency business, formerly carried on by the late Mr. Bowmer.

Mr. Langley devotes his prompt personal attention to the negotiations entrusted to him, and treats confidentially and with care all matters relating to professional business. The strictest reserve will be practised in all the preliminary arrangements, and no expense incurred (except in special cases) unless a negotiation be completed.

The General Partnership and Commercial Agency business still recently conducted by him at his City offices, and his experience in the management of large commercial undertakings, combined with his professional acquirements, enable Mr. Langley to guarantee that all matters of business placed in his hands will be carried out without delay, and with an equitable regard to the interests of all the parties concerned.

Mr. Langley can refer to the Professors of his College, Members of Parliament, Clergy, Merchants, Bankers, and others, as a guarantee of his integrity and honour in all negotiations entrusted to him. Full information as to terms, etc., sent free on application.
Office Hours, from 11 till 4; Saturdays from 11 till 2.

Competent Assistants provided

without delay, free of expense to the Principals. No gentlemen recommended whose antecedents have not been inquired into. Apply to Mr. Langley, 50, Lincoln's-inn-fields, W.C.

Partnership.—Mr. Langley is

instructed to make arrangements for the introduction of a suitable gentleman to a half-share of a high class Practice in one of the best suburbs of London. Income about £1000 a year. The opening is an unusually good one for a young married gentleman accustomed to good society.—Address "S. 1103," Professional Agency Offices, 50, Lincoln's Inn Fields, W.C.

In a large Manufacturing Town

(Midland) a well established Family Practice for transfer. Average income for the last three years £160, last year £190. Vendor being independent, has selected his patients, and has never made any effort to enlarge his professional connexion, which could be immediately increased by an active gentleman. House rent, £45. No horse or carriage necessary. Terms, one year's purchase, including a six months introduction, but the length of introduction may be extended to suit purchaser.—Address "S. 1114," Mr. Langley, as above.

Dr. Chapman's Spine-Bags (Pa-

tent. For the Application of Cold and Heat along the Back. The Ice-bags may be had of any of the following lengths:—10, 12, 14, 16, 18, 20, 22, 24, and 26 inches.

The ordinary sizes of the Hot-water Bags are three, named respectively "small," "medium," and "large."

Sold by

C. MACINTOSH & Co., the Manufacturers, 3, Cannon St. West, London;
S. MAW and SON, 11, Aldersgate Street, London;
JOHN G. GOULD, 198, Oxford Street, London;
THOMAS CHAPMAN, 56, Buchanan Street, Glasgow;
And may be had by order of all Druggists.

Observations

ON THE

CÆSAREAN SECTION AND ON OTHER OBSTETRIC OPERATIONS.

BY

THOMAS RADFORD, M.D.,

F.R.C.P. EDIN. AND F.R.C.S. ENG., ETC.,

HONORARY CONSULTING PHYSICIAN TO ST. MARY'S HOSPITAL,
MANCHESTER.

CHAPTER IV.

On the Performance of the Cæsarean Section, etc.

THE process adopted by Nature in some of those cases of labour in which she cannot overcome the obstacle which prevents the passage of the infant through the pelvis, is, in the first instance, the yielding of the uterine tissue, thereby making an opening for its escape. Afterwards, if the constitutional powers prove equal to the entire process, an incase-ment of the foetus is effected by the effusion of lymph. And, after a time, a pointing in some part of the abdominal parietes shows itself, which is soon followed by ulceration, and part after part of the infant passes through the opening, until the whole contents of the cyst are discharged. This is a very slow and hazardous process.

In adopting the Cæsarean section, we in some measure imitate Nature in her attempt to remove the infant, although by a much more safe and an expeditious plan.

This operation ought not to be made one of display. There should only be a very few persons present; and the greatest quietude should be afforded to the patient. Every cause likely in any way to create unpleasant emotional feeling should be most carefully avoided. These rules were strictly observed in the two successful cases in which I was engaged. It is of the first importance, when possible, to adopt all such measures as will prepare the patient to undergo this operation, by improving the general health.

The bowels should be emptied by a large quantity of warm water thrown into the rectum and colon, by an enema-apparatus with a long flexible tube (like the one used to enter the stomach), so that its extremity can reach beyond the great projection of the sacrum.

The bladder must also be emptied by a catheter, equal in length to that used for the male. This organ is forced downwards and forwards, and lies under the deflected uterus, whereby its cervix is lengthened and compressed upon the pubes. This altered position of the bladder is particularly to be observed during the latter month of pregnancy, in cases of pelvic distortion from mollities ossium. Frequent examinations *per vaginam* have been already shown to be extremely injurious; so that this practice should not be allowed. In an exploration made to ascertain the measurement of a distorted pelvis, the obstetrician is compelled to pass his hand completely, and as far as possible, into the vagina. Anxious to ascertain the state of the os uteri, the presentation of the infant, and the exact available space in the

pelvis, he prolongs the operation, and often repeats it. And when consultations are numerous (as is too common) in these cases, serious mischief is inflicted on the pelvic organs and tissue. By one effectual examination, every necessary information may be obtained. The interest of the patient is best secured by having only a limited number (say two persons) in consultation.

The operation should be performed on the bed; so that the patient may be kept as quiet as possible afterwards. In some of the cases in which the woman was removed to a table, some untoward circumstance happened.

The temperature of the room should be regulated, and a genial warmth of the atmosphere maintained.

The uterus projects more or less forwards; and when the pelvic distortion is caused by mollities ossium, this organ assumes the retort shape. Its projection is so great, that its normal anterior surface rests upon the thighs of the patient when she sits, so that the fundus necessarily stands most foremost. Before the incision is made, it is of the utmost consequence to raise the deflected uterus up; or else the fundal tissue, which abounds with large anastomosing vessels, must unavoidably be divided. Neglect of this caution has, no doubt, led to the hæmorrhage which happened in some of the cases. A division of the structure of the upper part of the fundus of the uterus must certainly interfere with the regular or efficient contraction of this organ, and thereby produce a gaping character of the wound.

When we contemplate the mischievous effects of protracted labour, and review the unfavourable condition in which most of the patients have been brought by unwisely procrastinating the operation, we must at once be convinced how important it is to perform it early. The sooner the better it is had recourse to after it is determined upon, either as one of election or one of necessity.

When labour is rendered difficult by great distortion of the pelvis, or by large exostoses, or by large tumours in its cavity, some of those natural organic changes are not to be found, which would otherwise guide us, and enable us to judge of its commencement and progress. To wait, then, in such cases as these for the dilatation of the os uteri is not only a great mistake, but also a very great evil; for, in most of them, this part of the uterus cannot be touched, and, in general, very little dilatation of it does or can take place.

The dangers of delay, on expectant grounds like these, which so frequently happened in the registered cases, ought to guard us against waiting for those indications which cannot possibly be discovered, and induce us to operate early. As soon as the labour is established, and before or immediately after the membranes are ruptured, is the most favourable time to proceed. Great advantage accrues from adopting this plan; for the length of the uterine incision would relatively diminish in size, equal to the diminution which takes place by the contraction of the uterus. Another great advantage arising from this course is, that the danger of protraction would altogether be avoided. It is a well known fact, that little risk comparatively occurs before the waters are discharged.

Before the incision is made, the location of the placenta should, if possible, be ascertained, in order

to avoid its being wounded. In the 77 cases, it is reported as follows. In 29 it was connected to the fore part of the uterus; of this number, in 2 it was placed towards the fundus; in 13 it was cut upon. In 10 cases, it was adherent on or towards the back part of the uterus. In 31 cases, the position of it is not alluded to; and, therefore, it is to be presumed it was posteriorly placed. In 5 cases, it occupied the fundus; in 1 case, it was found near the left Fallopian tube; and in one case, it was attached (placenta prævia) over the os uteri.

This minute inquiry as to the precise fixture of the placenta has not been made merely for the purpose of suggesting rules of caution which ought to be observed before making the incision: but, also, of proving that this organ has not a definite position assigned to it.

It is, then, of the greatest importance to make the incision so as to avoid, if possible, cutting upon the placenta; as considerable danger may accrue from so doing.

The stethoscope will nearly always enable us to avoid these hazards. By it we derive positive information of the infant's life, by hearing distinctly the pulsations of its heart; and it affords us negative evidence of the infant's death, when no cardiac sounds are perceived through it. The audibility of the "placental *soufflet*" directs us to investigate the quarter from whence the murmurs proceed: and by attention, we may nearly always assure ourselves in what vicinity of the uterus the placenta is fixed. If this sound is not heard, we have a right to conclude that this organ is not within the reach of the knife if the infant be still alive. If it be dead, no great risk will be incurred if the placenta be divided, as the vascular function of this organ will then, doubtless, have ceased.

The position and direction of the external incision has varied. In 57 cases, it has been made longitudinally: in 11 of which number, it was made on the right side; in 24 cases, it was made on the left side; and in 22 cases, it was made in the centre of the abdomen. In 2 cases, it had a transverse direction on the right side. In one, it was made obliquely on the right side. In 17 cases, the situation and direction of the wound is not recorded.

I prefer the wound to be longitudinal, and on the left side.

There are no tissues concerned in the operation which require very slow or nice dissection; therefore, unnecessary tediousness should be especially avoided. If the uterus be slowly incised, the stimulus of the knife instantaneously throws this organ in violent and irregular contraction, which separates the placenta, and entails mischief on both the mother and the infant. Every precaution having been taken, we ought to strictly observe the motto, "*Cito et tuto*". The incision should be made on the body of the uterus, because this portion of the organ is eminently contractile, and ought to extend well towards the fundus, but not into it. It ought not, however, to be carried too far down into the cervix uteri, because this part possesses dilatable properties which are unfavourable to a diminution in the size of the wound.

When the uterine incision is completed, there should be no delay in withdrawing the infant. When it lays in its usual natural position, with the head over the brim of the pelvis, then the obstetri-

cian should seize its legs with his right hand, and pass his left cautiously and quickly down so as to embrace the face on one side, or the hind part of its head. By this mode, a double power could be effectually exerted: one of traction by the legs, the other by raising the head upwards.

If the breech offer at the incised uterine opening, the practitioner should seize it with his right hand and withdraw it, and at the same time use his left hand as above mentioned. If the head lay in proximity with the incision, then it ought first to be brought forth, and, at the same time, he should pass one hand cautiously forward along its body so as fairly to embrace the breech, and act with both his hands as recommended above. These precautionary rules are suggested to prevent the grasping seizure of the neck or the hips of the infant, as the case may be, during its removal. (*Vide* remarks already made.) One or two writers have urged, that the head of the infant should be always first extracted, on the grounds of being safer for it; but a conditional practice, according to its position in the uterus, is by far the best.

The head is most generally situated in the lower segment of the womb, and, therefore, at some distance from the centre of the incision. In order to bring it fairly to the opening, it would produce a great strain on, if not laceration of, the contracted uterine tissue, and create nearly a doubling of the child upon itself before it could be extracted. And as expedition is required, it would be found that the bulk of the head was not very readily grasped with sufficient firmness so as to ensure its speedy withdrawal. Time would be lost, and impediments added. The placenta, with the membranes, should be also quickly extracted.

Protrusion of the intestines is very apt to occur during the operation; this becomes very troublesome to the operator and distressing to the patient, and a considerable time is consumed in order to replace them. This accident not only predisposes to remote mischief; but it immediately tends to depress the vital powers of the woman. She feels faint, and has a sense of sinking. Every care should, therefore, be taken by the assistants to repress and retain these viscera under the integuments by an extended application of both hands on each side of the incision. It is of the utmost importance, that the edges of the external wound should be effectually secured. Sutures or pins ought to be inserted at very short distances; and a considerable extent of the parietes (not embracing the peritonæum) should be included, especially in those cases in which the integuments are much attenuated.

The after-management of the patient must be conducted on recognised medical and surgical principles. Much mischief has been done by active treatment; and it should never be forgotten that, even if it be thought desirable to pursue this plan, it should always be relative to the state of the woman. A negative treatment has been found by me most advantageous. Opium, in full doses if required, should be given.

It is now a general practice to administer chloroform before and during the performance of important operations. If cautiously used, the data already accumulated justify the inference that it is of great advantage to the surgeon, by inducing a state of resistless quietude of the patient. The severity of the

pain inflicted by the knife is considerably lessened, and the shock to the nervous system is thereby diminished. In the majority of surgical operations, there are no other contingent circumstances relative to the administration of this drug which require the attention of the operator, except the necessity of his having first ascertained whether there exist any organic disease of the heart or large vessels which would be dangerously influenced by it; but it is otherwise when it is proposed to use it in a Cæsarean case.

The incision made into the uterus must be at first necessarily large, to enable the obstetrician to extract the infant and the placenta; but, after their removal, the length of the wound is very considerably diminished by the contraction of this organ, which, if not interrupted, is both instantaneous and energetic, thereby effectually preventing any great loss of blood. It is, therefore, very important to inquire whether chloroform interferes with, or altogether suspends, this normal contraction; or whether it induces this action *de novo*, or strengthens it in intensity.

Chloroform has been inhaled in fifteen Cæsarean cases: in one of which there was hæmorrhage; in two of which there was very little blood lost; one of which cases, it is stated, was benefited by its inhalation; and in three instances the discharge of blood was considerable, two of which proved fatal. One of these cases, however, recovered. In one of the cases, the uterus did not contract much; in one, the hand was pressed upon it to induce contraction; in four cases, it is stated, that this organ contracted well. Three of these patients were completely unconscious; and one (which I saw) was only partially under the influence of chloroform.

Ether was administered in one case in which there was some bleeding, but not so much as to be considered to be alarming.

Obstetricians differ in opinion as to the positive effects of chloroform on the uterus. Some say uterine action is retarded by it. Others, again, assert that it does not interfere with it; and there are others who affirm that it promotes and strengthens it. The data which exist on this subject are very meagre and very contradictory; and, therefore, with such discrepancy of opinion, it is impossible to come to a satisfactory conclusion on this subject, especially in reference to its use in Cæsarean cases, in which it is of the highest importance that the normal action of the uterus should not be disturbed. It would, however, be most advantageous to the patient, if she could be safely spared the pain inflicted by the operation; although not one of those women in whose cases I was concerned complained of pain during its performance, but, on the contrary, bore it with great moral courage and fortitude; and most of them observed that they suffered less from the incision, than the anguish they had endured from one of the unavailing labour-pains.

The disturbed state of the vascular and nervous system in all those women who have undergone this operation, must most assuredly render them unfit subjects for chloroform; and, therefore, the deductions which may be drawn from the results in these cases in which the women laboured under incurable disease, and were exhausted from protracted labour, ought not to prejudice us altogether against its use.

We find that vomiting occurred in eleven of the sixteen cases in which chloroform had been administered. In two of the cases, the abdominal wound was rent open by the violent efforts induced; and in several of the others, disagreeable effects ensued. If chloroform do really produce vomiting and its injurious effects, there can be no doubt it ought to be discarded, as it is most important to keep the patient free from all causes which have a tendency to disturb the reparative process in the wound.

So long as the Cæsarean operation is considered only one of necessity, and its performance so unwisely and so cruelly delayed, great risk must attend the inhalation of chloroform. But, if it be made an operation of election, so that women who are in a better constitutional state undergo it, and if, likewise, it be timely performed, then it may be found that great advantage may be derived from the use of this drug; but, nevertheless, before we acknowledge chloroform as a recognised means for this operation, we ought to be fully satisfied what effects it produces on the uterus.

SUPPRESSION OF QUACKERY. No quack is permitted to practise in France. When a man is about to commence the practice of medicine in any town there, he is obliged to present to the mayor, or other authority of the town, his diplomas, and if they are not *en règle*, he is not allowed to open his practice. The result is, that the public health and the purses of individuals are alike protected. Why cannot that which is done in France be done in England? (*Solicitors' Journal*.)

SCOTTISH REGISTRAR-GENERAL'S REPORT. The Registrar-General observes that the character of the weather during any year is almost always different in Scotland and England. In 1864 England was suffering from drought; the returns from 55 stations show a fall in Scotland of 38.6 inches, a fall somewhat above its average. There was nothing in the meteorological phenomena of the year to account for the great epidemic of typhus which prevailed. It attacked large masses of the people in the early months of the year, abated in the warmer season, but again resumed its virulence in September, and increased more and more till the year closed. The epidemic appeared among the people while in the midst of plenty, plenty of work, high wages, and cheap food being the characteristics of the year. The town where the demand for labour has been greatest and wages highest, and in which there need not be a single person idle—viz., Greenock, has been the town where typhus has been most virulent and fatal, causing above 14 per cent. of the deaths of the year, including among its victims four of the medical practitioners. Taking the experience of the Royal Infirmary of Edinburgh—namely, 1 death in every 12 cases of this epidemic, above 7 per cent. of the population of Greenock must have been attacked with typhus fever in 1864. But Greenock is shown by the register year after year to be by far the most unhealthy of the eight principal towns of Scotland, if not the most unhealthy town in Scotland. The inhabitants have to contend with two adverse causes which tend to induce predisposition to attacks of epidemics—a low-lying, damp site, and greatly overcrowded dwellings, the house accommodation not keeping pace with the increase of the inhabitants. The report has to record an extremely unhealthy year; but small-pox was happily less prevalent than in 1863, and the new compulsory Vaccination Act is working much better than was anticipated.

Clinical Records.

XV.—REMARKABLE CASE OF PURPURA HEMORRHAGICA, FOLLOWING SYPHILITIC CARIES OF THE BONES OF THE NOSE.

BY
HENRY LEE, Esq., F.R.C.S.,
SURGEON TO ST. GEORGE'S HOSPITAL.

A GENTLEMAN had suffered for some months with disease of the bones at the back of the right nostril, and a piece of bone at one time had become separated, and was swallowed. A very large number of rupial looking sores formed on different parts of the body. These sometimes extended, sometimes healed, and at other times remained stationary. Occasionally, and generally when the ulcerations were better, he had very severe pains, accompanied by a considerable amount of swelling in different parts. These "rheumatic pains", as he called them, affected principally the elbows, wrists, and knees. The pulse was generally quick, weak, and occasionally irregular; and he had been under the care of several physicians for supposed disease of the heart. He frequently felt faint, and was in the habit of carrying some stimulant in his pocket.

On October 11th, after having been unusually depressed and uncomfortable, hæmorrhage occurred from both nostrils. This was followed by a swelling, which attained the size of a bean, on the lower lip. This swelling was formed of epithelium raised by effused blood. Spots of purpura appeared all over the body, but chiefly upon the arms. Hæmorrhage occurred from the gums, and from the mucous membrane of the eyes. The urine passed contained blood. The nostrils, from which the largest amount of blood passed, were now plugged.

Oct. 12th. Three chamber-pots, each more than half full of bloody urine, had been kept. Hæmorrhage from the gums continued. The skin was yellowish. The mouth was occasionally filled with blood. There were hicough and sickness. Some blood oozed from the penis.

Oct. 13th. Three chamber-pots, each more than half full, of bloody fluid had again been passed. The contents of one of these vessels had become coagulated in one mass.

Oct. 14th. Fresh spots continued to appear upon the skin. There was a continued sensation of sickness and occasional vomiting. Food and medicine were rejected, mixed with altered blood.

Oct. 15th. The motions contained a large quantity of decomposed blood. The lips were blanched. Bleeding from the gums continued. The urine contained nearly the same amount of blood. Ruspini's styptic was ordered.

Oct. 16th. The pulse had become more regular, and rather stronger. The bleeding from the mouth had stopped. He passed a much smaller quantity of water. The lips had assumed a more natural colour.

Oct. 17th. There was excessive restlessness. Many of the spots on the body and arms had assumed the appearance of large bruises. The bleeding from the mouth has recurred. He had great difficulty in swallowing.

Dr. Markham now saw the patient in consultation, and gave a decided opinion that there was no disease

of the heart. Nothing could, after this, be kept on the stomach in any quantity; and the patient died on the 18th.

Dr. Dickenson was good enough to examine the body on the following day. The bones at the back of the nose were extensively diseased. Spots of purpura of various sizes, and presenting different colours, were scattered over the body. In the chest, the heart was found quite healthy. Spots of ecchymosis studded the surface and the interior of the lungs. Similar spots existed on the convex surface of the diaphragm.

In the abdomen, spots of ecchymosis were scattered over the whole of the intestines, and could be seen of various sizes under the peritoneal covering.

The kidneys, which were otherwise tolerably healthy, were mottled throughout their structure and upon their surface with circumscribed patches of a very dark colour. These contrasted strongly with the appearance of the natural structure of the organ, and produced a very peculiar and remarkable appearance.

The pelvis of the kidney and ureter on each side was full of what appeared to be semi-coagulated blood.

The intestines were filled with a brownish fluid, evidently composed principally of blood which had been changed by the secretions of the stomach and intestines.

HOSPITAL PRACTICE:

METROPOLITAN AND PROVINCIAL.

ST. GEORGE'S HOSPITAL.

CASE OF AMPUTATION THROUGH THE KNEE-JOINT:
WITH REMARKS.

By THOMAS P. PICK, Esq., Surgical Registrar.

THE cases in which amputation through the knee-joint is practicable are very uncommon, and rarely fall under the notice of the surgeon. The following case is, therefore, recorded as showing the good results which may follow this operation; and also that the great objection—viz., the extensive suppuration which is said to ensue in these cases—is not so formidable as is sometimes supposed.

James F., aged 51, sawyer, was admitted November 9th, 1864, under the care of Mr. Pollock.

History. Twenty-five years ago, a small pimple appeared on the leg. It increased, and "became like a wart, remaining quite dry," until five years ago, when he knocked it off. Since then, it increased in size, and constantly discharged a thin fluid. Latterly, it increased very rapidly, and the discharge became very offensive.

On admission, the right leg was found to be much swollen; the skin red and tense. Over the front of the tibia, extending two-thirds of the length of that bone, was a large foul ulcer; the edges were very much raised, hard, and nodulated. It appeared, from looking at the edges, to consist of a number of hard uneven nodules, which had burst and ulcerated in their centre, though the greater part of the wound was covered with a foul, uneven, ulcerated surface, supporting pale flabby granulations. Here and there, the surface of the tibia could be felt to be exposed and roughened. The glands in the groin were slightly enlarged. The patient was thin and emaciated; his countenance pale; aspect anxious; pulse

weak and quick. There was profuse and extremely offensive discharge of a peculiar sickly odour.

Nov. 17th. Amputation through the knee-joint was performed under chloroform. A large semilunar flap was made on the front of the joint, and was joined by a smaller one on the posterior surface; the various ligaments were then divided, and the limb separated. The patella was not removed. Several vessels required ligature. The flaps were brought together by silver sutures, the anterior one being sufficiently long to completely cover the end of the bone. On examining the parts afterwards under the microscope, well-marked cancer-cells were found.

Nov. 19th. There was considerable febrile excitement. His tongue was dry and brown; mouth parched; the bowels were not open; pulse 64, weak. There was a little discharge from the wound. He was ordered to have four ounces of red wine; and an effervescing saline draught every four hours.

Nov. 21st. He still continued feverish; did not sleep. His countenance was anxious. He had no pain, but the stump "felt heavy". The tongue was inclined to be red at the tip. Pulse 72; skin hot and dry; conjunctiva tinged. The bowels had not acted since the operation. He was ordered to have a common enema immediately.

Nov. 24th. The patient felt very much better. His tongue was almost clean. He slept well, and enjoyed his food. There was some swelling of the stump, and very considerable discharge. The sutures had been removed; and the flaps had separated, leaving a portion of cartilage exposed. He was ordered to have warm Goulard lotion applied.

Nov. 26th. There was very much less swelling, and less discharge. The wound was quite clean and healthy, and was beginning to cicatrise; there was one small point of cartilage still exposed. He felt very well in himself.

From this time he went on well; the wound healing. On December 17th, the notes say that the wound was nearly healed; one small sinus remaining, which discharged slightly. He was discharged December 21st, with a very good stump. The patella was drawn a couple of inches up the front of the femur; there was a soft cushion over the end of the bone.

There is no doubt that the advantages of this operation, where practicable, over amputation of the thigh higher up, are great. Among them may be ranked the facts, that the limb being removed at a greater distance from the trunk, there is less shock to the system; that the medullary canal not being opened, there is less chance of purulent infection; and that there is a longer stump left; and, moreover, that stump has a somewhat clubbed extremity, thus permitting the more perfect adaptation and the firmer hold of an artificial limb. The principal disadvantage appears to be the leaving behind a certain amount of cartilage and synovial membrane, which must be destroyed by suppuration before the wound can heal. This may be obviated by sawing off the articular extremity of the femur, as is commonly recommended by authors on this subject; but, in this procedure, some of the advantages accruing from this operation are lost.

Of the two operations usually recommended, the one performed in this case appears to possess decided advantages over the one recommended by Syme, of making the large flap from the integuments of the ham; the tough skin over the knee forming a far better pad, and one well adapted for pressure; and at the same time, in the former operation, there is much freer exit for discharge.

It becomes a question whether, in these cases, the patella should be left; but there does not appear to be any object in removing it; for, as in the case

under observation, it becomes drawn up out of the way by the extensor muscles, and does not in the slightest degree inconvenience the patient.

BIRMINGHAM AND MIDLAND EYE HOSPITAL.

THE TREATMENT OF GLAUCOMA BY IRIDECTOMY.

Under the care of J. V. SOLOMON, F.R.C.S.

[Concluded from page 639 of last volume.]

CASE XXIV. *Inflammatory Glaucoma of Two Weeks' Duration: Blindness: Iridectomy; Reads Pica, or Jäger's No. 12.* Eliza Spencer, aged 40, was admitted January 14th, 1864, with blindness from inflammatory glaucoma of two weeks' duration. The tension was of the second degree (T 2). Owing to the patient being very excitable, intractable, and "deaf as a post", no ophthalmoscopic examination was attainable, either on admission or subsequently. There was external redness of the eye; a much dilated pupil. The humours were too cloudy to admit of illumination.

Operation. A broad iridectomy of the upper circle was at once performed. The portion of iris removed was more easily separated from its origin than in any case in which I have operated. No untoward accident followed the treatment. In three weeks (February 16th), the tension was rather below the normal standard. At this date, the patient could see features plainly, and read Snellen's xx. Examination at a later period in the year proved that, with a ten-inch convex, she could read pica, or Jäger's No. 12. The tension was normal.

This and the preceding case were examined by the members of the Midland Medical Society, during the presidency of Mr. Langston Parker.

CASE XXV. *Subacute Choroido-iritis of Five Weeks' Duration: Eyeball hard (T 3): Perception of Shadows only: Iridectomy. In Thirteen Days, Pica was read with Ten-inch Convex Glass.* John Reynolds, aged 52, was admitted February 14th. He was in excellent health. The left eye presented the usual signs of subacute choroido-iritis. The pupil was not dilated more than the right, which is healthy, and presents a diameter of about three-quarters of a line. The sensibility of the cornea was good; the eye as hard as a stone. The right globe was also hard (T 2½). Vision was limited to the perception of the shadow of two fingers at nine inches—not further. He has never had much pain. He became aware of his disease from having, five weeks since, accidentally closed the right eye; after which, iridisation and much variation at times in the visual power were noticed. For two weeks previous to admission, he received medical treatment; when, in consequence of no progress having been effected, Dr. Harrison of Walsall sent him to me as a proper case for operation.

A moderately broad iridectomy was immediately made at the upper and outer circle. No accident occurred; no blood entered the chamber. The eye was dressed with cotton wool, and a few turns of a bandage made of "domet". In three days, features could be seen, and fingers counted. On the thirteenth day of operation—viz., February 27th—Jäger's No. 12, or pica, was read at nine inches, with the aid of a ten-inch convex glass. In doing this, the eye was much everted, and required time for fixation. The globe continues to be hard. He was allowed to return home to Walsall.

March 10th. The nasal and temporal fields of vision are three inches respectively.

The preceding report is condensed from full notes taken by our house-surgeon, Mr. Arthur Bracey.

Original Communications.

WHAT IS CHANGE OF TYPE IN DISEASES?

By W. O. MARKHAM, M.D., F.R.C.P., Physician to St. Mary's Hospital.

DR. BARCLAY must not be surprised if his lectures on *Medical Errors* "excite", as our French brethren say, "susceptibilities". If he had contented himself with pointing out the illogical therapeutical doings of the Arabians, or of the Greeks or Romans of old, or even of our dead and buried great ones of the last generation, he would probably have not been troubled with objectors. But to prove to a modern living doctor that some favourite method of cure of his—in defence of which he is ready to stake his reputation and all his convictions—is a perfect delusion, naturally renders that doctor atrabilious. It has very much, in fact, the effect of treading on a man's favourite—that is, most exquisitely tender—corn. It is, indeed, at all times, a serious thing to be shown up as an illogical dealer with facts by so high an authority as Dr. Barclay, and in a work, too, especially devoted to the treatment of the "fallacies of the faculty"; and persons naturally become very thin-skinned when, in addition, they are castigated before that high court, the College of Physicians. Happy are such persons, therefore, if they can find a screw or two loose in the armour of the logician himself.

I should not, however, myself have ventured to call attention to a passage in Dr. Barclay's *Medical Errors*, wherein I am indirectly called to account, if I did not think that Dr. Barclay's error—for so I must be bold enough to call it—was far from being peculiar to himself. I refer to the interpretation which he gives of the meaning of the words "change of type" in disease. The words are very common ones, it is true—words of late years almost in daily use in our conversations about diseases. But do we really know each what the other means when we are using them? Have we, many of us, really any distinct idea at all of the actual value of the terms? I have at times asked friends offhand what they mean when they speak of this "change of type"; and have been often surprised to find how vague is their notion of its import. Moreover, when I find in a work devoted to the enunciation of "medical errors", what seems to me a manifestly erroneous definition of the term, I think I may be excused if I attempt to give to it something of its actual value; or, at all events, if I ask Dr. Barclay, when he uses it in future, to define his terms. The question is not a mere barren tale of words; for the actual practical doings of doctors are closely mixed up with this "change of type".

Dr. Barclay's error will be found in the following passage of his *Medical Errors* (p. 81).

"I need not, however, examine a question which has been so ably discussed* on a recent occasion, when we were taught that there is no change of

type in disease, though cholera was unknown in Europe forty years ago, and though plague, once so constant a visitant in this city, has, for the present, entirely ceased to spread beyond the regions of the Levant, where it seems to have its constant habitat."

My friend Dr. Barclay, in this passage, whilst nominally flattering my "able discussion" of the subject of bleeding, actually convicts me of apparently a very barefaced absurdity in discussion. I think his logic should have suggested to him that, when the *reductio ad absurdum* was so manifest in the conclusion, it was probable that he and I differed because we attached a different sense to the terms we used. Indeed, if my friend had taken the trouble (which I must now ask him to do) to read, in the lectures which he criticises, the definition which I have there given of "change of type of disease", he never could have written the words of his above given.

Dr. Barclay has thus, in his *Medical Errors*, himself committed a great error. He attempts to convict me of an absurdity in argument, by improperly using the words "change of type", not in my sense, but in a sense which he himself has given them, and which never has been given them by any departed, and, I may venture to say, never will be again given them by any living, doctor. He employs the term erroneously; and then gives me a quietus—a logical settler—as the correct conclusion of his false assumption.

Now, according to Dr. Barclay, whenever a new disease appears, and whenever an old one disappears, a "change of type in disease" has taken place. Thus, for example, when syphilis, or when cholera, or when yellow fever, or when small-pox, first appeared, disease changed its type. In fact, whenever Pandora has opened her box and let a new disease loose on the earth, or has transported a disease from one quarter of it to another, diseases have changed their type in the district where the event has happened.

More than this, Dr. Barclay says, if plague no longer ravages London, disease has changed its type. If small-pox, therefore, were to be annihilated by vaccination, diseases would have changed their type. If typhoid and typhus, or if ague, under good sanitary arrangements, disappear, diseases have changed their type. According to Dr. Barclay, in fact, *change of type of disease is represented to us by the appearance or the disappearance of disease in a given district*. Surely, he might just as reasonably have argued that vegetables changed their type when the potato was introduced into England; or that quadrupeds changed theirs when wolves disappeared!

Dr. Barclay says cholera has found its way into, and the plague has found its way out of, England: therefore diseases have changed their type! But how, in what way, has disease changed its type? Is cholera not still ever cholera morbus? Is plague not demonstrated to us still by the same tokens and signs which have ever been its fatal diagnostic marks? If a contagious disease be transported from the East to the West, and still ever remain the same identical disease—ever characterised by the most characteristic of symptoms in the West as in the East—where is a change of type to be found? If London be so purified by sanitary arrangements, that the plague can no longer there find a satisfactory pabulum and breeding-ground, how has disease changed its type? Really, I must ask Dr. Barclay if there be any one of the many false deductions, which he has so well shown up in his excellent book, more patently false than the fallacy involved in this assumption?

At all events, be Dr. Barclay's definition true or

* "Blood-letting in Disease." Gulstonian Lectures. By W. O. Markham, M.D., F.R.C.P. (BRITISH MEDICAL JOURNAL, April 1861, &c.)

false, still must be stand convicted of that other fallacy in argument—viz., of using terms in a totally different sense from that which was given them by the writer whom he is criticising; and then, from the necessarily false deduction so arrived at, of accusing the said writer of a stupid blunder.

I will here add the definition which, in the lectures criticised by Dr. Barclay, I have given of "change of type" in disease; and will leave the reader to judge whether his or my definition of "change of type" is most near to its probable sense. I say probable sense, because, for my own part, I have never yet been able to find the smallest shadow of satisfactory proof that any change in the type of disease has ever occurred.

"I know not to whom is due the credit of first suggesting the term of change of type in diseases, nor when it first appeared in medical literature; nor do I know what was the precise idea attached to it by its inventor; but by the term is meant, as I understand it, not any imaginative alteration in the essential nature of diseases themselves, but some change in the condition of the body which is the subject of diseases. Inflammations, I suppose it would be argued, are the same now, in so far as their characters, anatomical and dynamical, are concerned, as they ever were since diseases fell on man; but the body in which they manifest themselves is somehow changed. The general diathesis of humanity has undergone some gradual transformation, so that the manifestations of the reactions of diseases upon mankind are different now from what they were in former days. Moreover, this change, some supporters of the theory tell us, is no partial one; the whole civilised human family has come under the novel phasis. Not only here, but at the antipodes, men will no longer bear the bleedings to which they were once beneficially subjected. And I believe that even veterinary surgeons have found, or have thought to find, the same to be true of the constitution of the animals subjected to their care.

"Besides this, it is not to be imagined that now, for the first time in the history of nosology, such peculiar modifications have occurred in man's nature. The course of diseases amongst mankind, authority assures us, has ever, at different epochs, been marked by variableness and shadows of change. To use the words of the authority referred to: 'There are waves of time, through which the sthenic and asthenic characters of disease prevail in succession, and we are at present living amid one of its adynamic phases.' 'I share in the belief' (he adds) 'which has grown out of the experience of many thoughtful and observant men, that, in this country, at least, the human constitution has for several years been suffering a gradual change; that almost all inflammatory disorders assume now-a-days a more adynamic type, and require less energetic treatment than in the early part of the present century.'

"It must also be remembered, that this supposed change in constitution is something quite distinct from the changes in man's bodily state which result from any of the well defined influences of occupation or climate to which he may be accidentally subjected. This peculiar change is, in fact, the resultant of an influence—an unknown influence—totally distinct from those ordinary influences, whose good or evil operations on the body we can note and appreciate; and, as I understand it, it has fallen alike upon all—upon the ruddy rustic, the corpulent alderman, the thin, shallow, anxious-faced man of business, and the pallid artisan; affecting each of them, and more and less, according to the varying merits of their constitutions."

NOTES ON

THE ADVANCE OF PHYSIC:

BEING THE ANNUAL ORATION BEFORE THE
HUNTERIAN SOCIETY FOR 1864-5.

By JONATHAN HUTCHINSON, F.R.C.S., Surgeon to the London Hospital; and Assistant-Surgeon to the Royal London Ophthalmic Hospital.

MR. PRESIDENT AND GENTLEMEN,—The return of our anniversary, with its customary address, offers an opportunity for general and somewhat discursive remarks, such as would be out of place at one of our ordinary meetings. I shall, with your permission, though, I fear, in but a very imperfect manner, attempt a few remarks on the great object which our Society has in view—the improvement of medical and surgical science; or, to use the concise terms of Sydenham, the Advance of Physic. In doing this, I shall venture to submit to your consideration certain matters of detail, as well as more general speculations.

Great as have been the triumphs of our profession in the past, and immense as has been the expenditure of human skill, industry, and enthusiasm, in achieving them, we have still to regret the exceeding imperfection of our art, in comparison with what the interests of humanity demand. Those who have looked most closely into the matter will probably be the first to admit, and indeed not only to admit, but to exult in the belief, that we have as yet only laid the very foundation-stones of that temple which our profession will, in the future, be privileged to uprear, "to the glory of God, and the good of man's estate."

Chief amongst the means to which we may look for great aid in the future progress of our art, is the much increased use of the pen and of the printing-press. A superficial glance at the present state of things might indeed lead us to suppose that already there exists a glut rather than a deficiency of books and journals. But it is not so. Good books are the stones with which we build, and they are still our greatest want. A book written with an honest simplicity of purpose, telling in plain language what we have seen and done, is still the greatest boon which any of us can confer on his profession. We must endeavour to compel our minds to regard books as being simply information—it may be opinions, it may be facts—put into type in order to facilitate reference. The voice of an individual can be heard but by few. The reading of manuscript is tedious and laborious; and, however public may be the place of deposit for manuscript essays, they will remain inaccessible to the majority. Even of our own note-books, when they have become voluminous, we can make but little use. When, however, an opinion or a fact is once put into good type, and placed upon a publisher's shelf, it is fairly launched upon the world. It is glorious to reflect how the seed thus sown almost in private and in silence may chance to grow up and fructify where least expected, and possibly to an extent which its sower had never calculated. There are few books which have not some germs of truth, and which do not effect some good; and the public may be very safely left, aided by the labours of critics, to choose the best, and allow that which it finds not usable to sink into disuse. Neither their authors nor the profession need be under any alarm as to superfluous books doing any mischief,—a little extra employment given to the trade, and there the thing ends. The mediocre book drops out of notice, and hurts no one. Many a book, however, which never attains what Mr. Churchill would call success, still serves silently a most useful purpose.

We little know, in the hurried rapidity of life, to what hints we are indebted for the trains of thought which become most valuable to us; and many a time, could we trace such to their source, we might find ourselves debtors to books or papers which, at the time of perusal, we put aside without a single sentiment of gratitude. It is a curious proverb which remarks, that "the slothful man roasteth not that which he took in hunting." As if his energy failed him at the completion of the chase, and when the excitement was over, he was too idle to consummate his achievements. I have often thought that there is great waste in medical matters, owing to this kind of sloth. We have medical investigators who love the chase for its own sake, and are careless about what it yields. Men of the keenest scent, and of the greatest endurance, whilst out in the hunting-field, are often those who show the least care about the game when it is bagged. I need scarcely explain, that the roasting of the kind of venison I speak of is the publication in a book, or in a journal, of the new knowledge which our prowess has secured us. In doing this, we not only increase its use to ourselves by making it more fit for assimilation, but we have the pleasure of being able to invite our friends to the feast.

It was the fashion with some of the foremost in former days to underrate books. Hunter's habit in this direction is well known; and Sydenham's reply to Sir Richard Blackmore, when asked what medical reading he advised—"Read *Don Quixote*, sir"—has been thrown at the head of many a medical author. We may rejoice that the majority have preferred to emulate the example of Sydenham and Hunter, and have declined to feel the force of their sarcasms. In the present day, however, books are far more essential than they were a century or two ago. The man who now neglects them can scarcely hope to advance his art. The first business of the investigator is to climb as quickly as he may upon the shoulders of his predecessors, so that he may view his subject from a fair vantage-ground. I admit that, in many instances, to work out a subject for oneself, and without loading the mind with the opinions of others, gives to the work a freshness and interest which it would not otherwise possess, and secures that sea-room for the mind which is so essential to originality. This plan, however, must not be pushed too far; and no single error has led to a greater waste of labour than injudicious attempts in this direction. The great use of books to students in science is, not for perusal, but for reference; and, in order that reference may be easy, it is needful that the books should be close at hand. If we look at the matter from this point of view, it will, I think, be clear to all, that no greater boon could be conferred on our profession than the cheapening of medical books. Let us have them so cheap that every student can easily afford to have a well stocked library. A little systematic effort in this direction would achieve much. There is surely no good reason why medical books and journals should always maintain their present high rates in comparison with those on general subjects. The chief reason why it is so is, that the demand is limited; and this is a matter which the profession has in its own hands. Let it be acknowledged, that "it is a man's duty to have books—that a library is not a luxury, but one of the necessities of medical life"; and we shall soon have a corresponding effort on the part of authors and publishers to meet the demand.

The able author of *Horæ Subsecivæ* has suggested a classification of medical men founded upon Bacon's use of the terms *fruit* and *light*. In the one, we are to class the man of genius, skilled in the search after principles and laws; in the other, the master in the

diagnosis and treatment of disease. He quotes Sir Charles Bell and Harvey as examples of the one; Abercrombie and Sydenham of the other. The one pursues their profession as a science to be taught, and, if possible, to be extended; the other, as an art to be applied. "The one is, in old phrase, *luciferous*; the other, *frugiferous*". Now, whilst admitting that the classification is founded on observation, it is still one in which we ought not to rest. It is most desirable, for the advance of physis, that all should keep in mind their double functions; that those most engaged in the speculative should still court familiarity with practical details; and those whose daily avocations lead them most into contact with medicine as an applied art, should still keep in mind their duty to use their opportunities for its advancement as a science. The day is happily past when any remonstrance was needed against despising the man of science, and extolling the practical man at his expense; but we need still a more full recognition of the absolute dependence of art upon knowledge. In this country, there is little need to insist upon the importance of practical affairs. There is no fear whatever that light, when obtained, will not at once be made full use of. The English mind certainly tends to err in the opposite direction; and we cannot too often recall Bacon's well known passage: "The industry displayed in experiments is but too often directed by an indiscreet zeal, at some prejudged effect; seeking fruit rather than knowledge. This is in opposition to the Divine method, which in the first day created time alone, delaying its material creations until the sun had illumined space." Or, again, "we are well aware that axioms, rightly framed, will draw after them whole sheaves of works; but, for that untimely and childish desire of seeing fruits of new works before the season, we absolutely condemn and reject it as the golden apple which hinders progress."

Very closely connected with the more wide diffusion of our printed literature, comes the subject of medical education generally. In entering on this most important topic, it is needful that we should rid our minds of all preconceptions as to the connexion between medical education in its true sense, and medical corporations for the granting of diplomas. The interests of the public undoubtedly require the existence of these corporations, by whom the portals of the profession are guarded against the ignorant and unsafe. It is no charge against these corporations, however, to say that they have done little or nothing for the advance of physis as a science. Such is not their function, or, at any rate, only indirectly. All true work must be perfectly voluntary. There is nothing that the better parts of our nature so much revolt at as all forms and degrees of compulsion. Although the system of examination for diplomas has done much to maintain a fairly level standard of knowledge throughout the profession, and to protect the public and the profession against empirics, yet it has probably retarded rather than otherwise the advance of physiology and of sound scientific medicine. It has done so by degrading science into a means to an end, instead of leaving her to be worshipped for her own sake. It has associated her pure name with memories of laborious cramming and of hated tasks. It has succeeded in linking what might have been unalloyed pleasures with a consciousness of surveillance and compulsion.

I call to witness the noble progress which the sciences of astronomy and geology have made without any external assistance, when I assert that knowledge is her own reward, and the human mind works best when least trammelled. In adopting this line of argument, however, I by no means wish to underrate

the importance of our corporate bodies, or to fail in thankfulness for the earnest efforts recently made to improve their operation. The examinations have of late years become much more reasonable and less arbitrary—that is, they have become such as better test a man's real attainments, and leave less and less to the power of mere cramming. When this end shall have been more perfectly attained, their evil influence will much diminish. But whilst it is possible for a student to allege with reason an approaching ordeal at one of the colleges as his motive for absenting himself from the wards and shutting himself up with his books, is there not something wrong? In anatomy, already, this has ceased to be the case, and examinations on the subject render familiarity with the dissecting room essential to success. In medicine and surgery, however, the plan of examining merely by question and answer still leaves the student at liberty, if he likes, to neglect familiarity with that which is the most important part of our vocation—nay, in degree encourages him to do so. I admit the difficulties in the way of examinations for diplomas, conducted with the patients before us, but these are what we must come to if our corporations are ever to exert their due influence in promoting the advance of genuine knowledge.

We must, however, look at medical education in a much wider sense than in so far as it conduces to the creditable obtaining of a diploma. A man's education consists in all that furthers his obtaining acquaintanceship with what is already known by others. Here we draw the distinction between education and original work. Under many circumstances the two may go together, but for the most part they are distinct. The great duty of each generation is to transfer its knowledge in the fullest and most complete manner to its successor. Each endeavours to add its fragments of new knowledge, and then to pass onward to its children the augmented sum. Happy is it, if in its zeal for new additions, it do not allow some items of the old to be forgotten or neglected. This is the great business of education. How best shall it be discharged?

Time does not permit us now to go into detail. One or two general remarks may, however, be ventured. All education should be as far as possible natural, and should be directed to eliciting the student's interest in his subjects, rather than compelling his attention to them. Again, I have to protest that Falstaff but illustrated one of the deepest rooted principles of our nature, when he utterly declined to give reasons upon compulsion. I therefore object for the most part to the establishment of curricula, and to the forced attendance upon certain courses of lectures.

Let our examining boards take more efficient modes of ascertaining what a man knows, and they will have no longer any motive for counting the months he has occupied in gaining his knowledge, or for compelling him to produce evidence that he has sat through certain thousands of lectures. Their object is to test his familiarity with medical science, not to gauge his powers of endurance. Let them attend closely to their own most important duty, and leave the candidates for their diplomas to gain the required knowledge when and where they like. To admit this great principle as one which, by degrees, must sooner or later be carried out, would be to solve one of the questions most under discussion of late in respect to medical education. It has been alleged by some, and with apparent plausibility, that the number of lectures now given is excessive; that the courses are both too numerous and too long. Now, instead of any diminution in the amount of oral instruction offered to our students, we might surely with profit

increase it if the objection of compulsory attendance were removed. It is most desirable that the fullest opportunities should be offered at our schools for the acquisition of the most recent knowledge in all branches of study, whether directly professional or only collateral, and that the varied advantages of the lecture-room should be most fully at the service of the student. It should be a matter of choice with the latter, however, whether or not he avails himself of them. If attendance on lectures were voluntary, I do not think the lectures would diminish in number, and I feel sure they would greatly improve in quality. The lecturer would be driven to the final resort of making his lectures instructive, or he would get no class. A healthy rivalry between different professors would be established, which would exercise a most beneficial influence on all.

Under the impression that the sum of medical knowledge has become so vast that it is impossible for the mind to master it without injury to itself, two different remedies have recently been suggested. The first and boldest is, that the surgeon shall, voluntarily and on system, restrict his studies and throw aside many of the subjects which he has hitherto deemed necessary. The second is, that we shall divide the subject of medical art into various special branches, and some of us take one, and some another. These suggestions are both of them so important in reference to the future advance of physic, that we must devote a few words to each. We will take first the question of specialities.

[To be continued.]

CASES OF HERNIA.

By SAMUEL H. STEEL, M.B.Lond., Abergavenny.

THE following cases of hernia present some features perhaps sufficiently unusual to render them worth publication in the JOURNAL.

CASE I. October 11th, 1-64, at 10 A.M., I saw William West, a gentleman's butler, aged 28, healthy, but of delicate appearance. He was suffering from symptoms of intestinal obstruction, which had come on shortly after dinner the day before. On examination, I found a soft swelling in the right groin, which he told me had existed since childhood; he had then worn trusses, but he had now left them off for some years. The right testicle was absent. The tumour, though not tense, was a little fuller than usual and rather painful. It gave me the impression that its superficial portion might perhaps consist of the testicle wasted and spread out under the skin. The taxis had no effect. I gave a dose of opium and left, intending to return as soon as possible and administer chloroform. This I did at 4 P.M. He was kept insensible for half an hour, and the taxis fairly tried. I also had the lower extremities raised over the shoulders of an assistant, and used the taxis while he was in that position, but without making any obvious impression on the tumour, which continued soft and non-resistant. On recovering consciousness, however, he said he was much relieved. I remained with him two hours, and then, vomiting not returning, I left him, desiring to be sent for should the symptoms recur.

I was again summoned at 10 P.M. when I requested my cousin and partner, Mr. Elmes Y. Steele, to accompany me. We found no change in the feeling or appearance of the swelling. It was tender, but not excessively so. Symptoms of strangulation had returned; vomiting was frequent. On consultation, an operation *without delay* was determined upon—1, because from the feeling of the tumour, from its want of tension and resistance, we were of opinion

that any further trial of the taxis would prove useless; 2, because, though the nature of the tumour was doubtful, yet it seemed probable that under the soft superficial portion a knuckle of constricted gut might be concealed. The symptoms, though not very urgent, were decided. The chance of relief from treatment by opiates and enemata was very uncertain, and if these were unsuccessful, the delay would be necessarily hurtful. An operation, the extent of which would be determined by the nature of the tumour as disclosed during its progress, was evidently the preferable course.

The first incisions were made through a hypertrophied layer of fat, which I had imagined might be the missing testicle. After dividing the remaining structures a sac was disclosed—not tense, but evidently containing fluid. Upon opening it, from two to three ounces escaped, the sac entirely collapsing; neither bowel nor omentum appearing within it. The finger introduced through the sac up to the internal ring, passed into the abdominal cavity, still without any strangulated intestine being discovered; but, crossing the internal orifice of the ring, yet within the abdomen, a tough membranous band was felt, underneath which, and constricted by it, though not very tightly, a portion of intestine could be distinguished. On attempting to divide this band with a hernia knife guided by the finger, I found it yielded before the edge, though the knife was sharp. After two or three ineffectual attempts to divide it, using the knife as freely as I could venture to do in such a situation, I requested Mr. Elmes Steele to examine the structure. On trying to divide it, he encountered the same difficulty as I had done; but, finding that the band yielded to traction, with the point of the finger he succeeded in drawing it into view, when it was freely severed. Upon now passing the finger through the ring into the abdominal cavity, it was evident that the obstruction had been removed; the bowel could be felt lying free. The upper part of the wound was closed with silver sutures, and water-dressing applied. Convalescence took place without a single bad symptom, except slight icteric discoloration of the skin for the first few days, to which, the patient informed me, he is liable on any slight derangement of health. The wound healed throughout by first intention, except one small sinus which gave very little trouble, and in three weeks he was about his usual avocations.

It is difficult to describe the structure which caused the strangulation in this case, nor was it possible to ascertain with the finger its exact connections. It was not formed by the neck of the sac, but lay beyond it, crossing the internal ring. The constricted intestine lay underneath it *within the abdominal cavity*, and was not very tightly compressed, but quite sufficiently so to cause the symptoms of strangulation, which were at once relieved by its division. Whether the bowel could have been disengaged by inflation with bellows, as described by Mr. Griffin in the JOURNAL for October 22nd, 1864, may be a question; but I confess I am unable to see how inflation of the colon can be a means of acting upon a knot of strangulated ileum. The chief points of difficulty in the case were: 1, the doubtful character of the inguinal tumour, which had neither the aspect nor the tension of an ordinary hernia; 2, the absence from the sac, when opened, of any portion of either bowel or omentum. The fibrous band within the abdominal cavity, and the mode in which it effected the strangulation of the bowel, were not discovered till after some little careful investigation, in which, as throughout the case, I was much indebted to the tact and judgment of my colleague. The result confirms the wisdom of the old rule—"In a doubtful case,

operate"—and I may add, "without delay." There was certainly a temptation in this instance to give the patient the chance of a night's interval before operating; but we should only have found him in the morning, after some hours of vomiting, in a worse position for recovery.

The effect upon the convalescence of delay in operating is well illustrated in the following case, which is interesting also, like the one already related, from the doubtful character of the hernial tumour.

CASE II. December 6th, at 9 P.M., I saw H. Vaughan, engine-driver, a robust man, aged 23. He was suffering from symptoms of intestinal obstruction, which had begun suddenly on the 3rd, but which had not been very severe. I found a right inguinal hernia reaching the upper part of the scrotum. It was soft and without tenderness, and was returned readily through a rather patulous external ring. I left him, having ordered a grain of opium every four hours. He was visited in the morning by my assistant, Mr. T. P. Collins, in whose hands the case remained for the next three days; during which time, however, I saw him once or twice. Mr. Collins reported to me that, after the apparent reduction of the hernia, the symptoms of strangulation subsided, but that, vomiting having returned after an interval, the hernia was found to have again protruded. It was again apparently reduced, the symptoms of strangulation remitting under the treatment adopted, with the exception that no satisfactory stool was obtained. On the evening of the 9th, Mr. Collins requested me to see the case again. I found the belly tender, but the hernia still soft, without tension or tenderness, and still easily reducible within the external ring, where it could be followed by the finger. In consultation with Mr. Elmes Steele, it was determined to operate on the following morning, should the symptoms persist and no stool be passed. The next morning, the man's condition being little altered, except that the matter vomited during the night began to have a stercoraceous odour, I operated with the assistance of my cousin and Mr. Collins. The tumour was found to consist entirely of omentum of a healthy and unchanged appearance; underneath it, at the upper extremity of the large dilated inguinal canal, was a knuckle of ileum of the size of a filbert, strangulated by the neck of the sac. It lay so deep that more than usual care was necessary in dividing the stricture, and I was obliged to enlarge upward the external incision in order to reach it with safety, having first removed the omentum. A good deal of venous oozing took place from the whole surface of the wound, which, when this had subsided, was closed as usual. The next day, however, it was found filled with coagulum, which was removed and the surface cleaned as well as possible. The intestinal functions were resumed favourably, but no part of the wound healed by first intention, an abundant and rather unhealthy discharge taking place during the first nine or ten days. Granulation succeeded in time; but nearly two months elapsed before the patient was able to resume work.

In this case, the apparently complete reducibility of the hernia and the remittent character of the symptoms were curious and deceptive, but I readily admit that its true nature ought to have been discerned, and the operation performed earlier than it was. Possibly the distension of the inguinal canal by the mass of omentum when reduced within the external ring, may have had the effect of dilating a little the neck of the sac, and thus caused the remission of the symptoms by releasing the tension of the stricture upon the incarcerated gut. That the latter suffered little from the delay is evident, but in other respects Vaughan's convalescence contrasts strongly

with that of West. He was the more robust and healthy subject, but he had suffered from strangulation more or less for nearly a week. During this time he had taken little food, and of that little the greater part had been returned. Assimilation had been very imperfectly carried on, and he had passed no stool. There had been no active inflammation, and the man's condition was apparently very favourable; but the effect of impaired nutrition was shewn in the obstinate oozing of blood from the wound, and the defective healing power which it manifested.

Hesitation and delay are the great causes of the fatality of hernia. Half an hour's trial of the taxis should, with very few exceptions, be sufficient to satisfy the operator whether the hernia is reducible or not; and when once a decision in the negative has been arrived at, every hour's delay of the operation should be regarded as inimical to the patient's prospects. In inguinal hernia delay is doubtless better borne, as a general rule, than in femoral, as in the latter case the stricture is usually very tight, and its effect rapid. I was much struck by this in a recent instance in an old woman, in which I was induced by considerations of convenience, such as often arise in country practice, to defer the operation from late in the evening till the following morning. The symptoms were not urgent; but, upon operating, a knuckle of intestine underlying a mass of omentum was found rapidly approaching a state of sphacelus. The patient recovered; but a very little more delay would have proved fatal to her. It is the frequency with which difficulties in obtaining assistance and other inconveniences tending to delay occur in country practice, that leads me to dwell on this trite and obvious point. Some of the cases narrated by Mr. Griffin, in the number of the *JOURNAL* before referred to, to which he was called in consultation, are instances of this. In some of them, indeed, there was gross malpraxis, such as we may hope is not often met with even in the most remote districts. To spend three or four days in administering drastic purgatives and enemata, relieved, I conclude, at intervals by the efforts at the taxis, in a case of femoral hernia, amounts to little less than manslaughter.

Reviews and Notices.

THE STUDENT'S BOOK OF CUTANEOUS MEDICINE AND DISEASES OF THE SKIN. By ERASMUS WILSON, F.R.S. Pp. 275. London: 1864.

A CLEAN SKIN: HOW TO GET IT AND HOW TO KEEP IT. Skin-Diseases of Constitutional Origin; their Etiology, Pathology, and Treatment. By JOHN WILKINS WILLIAMS, M.R.C.S.Eng. Pp. 114. London: 1864.

THE first of these books is an attempt on the part of the author to supply a class-book on Diseases of the Skin; and we are glad to find that this task has been undertaken by a dermatologist of such high authority and practical experience as Mr. ERASMUS WILSON. The present volume is only the first part of the work; the second is announced as being about to follow in a few months.

The first two chapters of the book are devoted to an account of the Anatomy and Physiology of the Skin, its Pathology, and the Classification of its Diseases.

The first chapter—that on the Anatomy and Physiology—is evidently much the same as the similar

chapter in Mr. Wilson's larger book; and, indeed, the whole of the work before us appears to be a well digested abridgment of the same, for the use of students.

In the second chapter, the author enumerates the usual characters of skin-disease, and those which appertain to the sensations of the patient. It is on the visual characters that is founded the classification of Willan. The author regards this classification, of which he gives a sufficiently full outline, as "a rude classification of great simplicity, than which none can be better suited for the early training of the student. Its fundamental principles are few and distinct, easily carried in the mind, easily recognised by the bedside, and easy of application under every circumstance." He, however, does not employ this classification as the basis of the present work; but, "in the absence of a more perfect system", adopts an arrangement which he designates as "clinical". "as arising out of the analysis of a large number of cases of disease". This arrangement is as follows; the groups being twenty-two in number.

1. *Eczematous Affections*; including Eczema, Psoriasis, Pityriasis, Lichen, Impetigo, Scabies, and Gutta Rosacea.

2. *Erythematous Affections*; including Erythema, Urticaria, Erysipelas, and Roseola.

3. *Bullous Affections*; including Herpes, Miliaria, and Pemphigus.

4. *Furunculous Affections*; including Ecthyma, Furunculus, Hordeolum, and Anthrax.

5. *Nervous Affections*; including Hyperæsthesia, Anæsthesia, Pruritus, and Porigo.

6. *Vascular Affections*; including Nævus vasculosus and Hypertrophica venarum.

7. *Hæmodyscrasic Affections*; represented by Purpura.

8. *Developmental and Nutritive Affections*; typified by Xeroderma, Ichthyosis, and Cachexia Cutis.

9. *Hypertrophic and Atrophic Affections*; exemplified by Nævus hypertrophicus, Ecchyma, Kelis, Bœcnemia tropica, and Atrophica cutis.

10. *Zymotic Affections*; including Rubella, Scarlatina, Variola, Varicella, and Vaccinia.

11. *Alphous Affections*; including Alophos alone.

12. *Strumous Affections*; including Scrofuloderma and Lupus.

13. *Syphilitic Affections*; embracing the syphilitic skin-diseases, of whatever form.

14. *Carcinomatous Affections*; including cancers of the skin in general.

15. *Leprous Affections*; including, as principal forms, Lepra and Vitiligo.

16. *Affections of the Hair and Hair-Follicles*; including Alopecia, Area, Canities, Hirsuties, Trichiniasis, Trichosis, Favus, Kerion, Sycosis, Plica, Erythema folliculorum, Stearrhœa, and Narcosis folliculorum.

17. *Affections of the Sebiparous Apparatus*; including Stearrhœa, Ichthyosis sebacea, Comedones, Accumulationes sebaceæ, Cornua, Tubercula miliaria, Tumores serosi, Tumores sebacei, and Acne.

18. *Affections of the Chromatogenous Apparatus*; including the Dyschromatodermata—for example, Lentigo, Ephelis, Melasma, Leucosma, and Chloasma.

19. *Affections of the Sudoriparous Apparatus*; as Idrosis, Anidrosis, Osmidrosis, Chromidrosis, and Hæmidrosis.

20. *Affections of the Nails*; including Degeneratio unguium and Onychia.

21. *Traumatic Affections*; including injuries resulting from the bites and stings of insects, and their

habitation in the skin; also other accidental injuries.

22. *Phyodermic Affections*; including Trichosis, Favus, Kerion, Sycosis, and Chloasma; and, according to some, Acan.

This classification, Mr. Wilson explains, is founded on a consideration of, 1, general affections of the skin; 2, affections of the nerves and vessels and blood; 3, disorders of development, nutrition, and growth; 4, specific affections; 5, diseases of special apparatus; to which are added, 6, traumatic, and 7, phyodermic affections. The arrangement, then, is very artificial—it is based on no one fixed principle; but, probably, will not be the less useful on that account in the present state of cutaneous pathology.

One remark we must make before leaving this subject; and that is, to ask whether Mr. Wilson facilitates the study of skin-diseases by the nomenclature which he employs. We cannot see the advantage of taking the trouble to translate into Latin such terms as "sebaceous accumulations", "serous tumours", "sebaceous tumours"; or even of using the Latin synonyms of the well known words "small-pox", "measles", etc. In defence of the plan followed by the author, the plea of uniformity would probably be urged; but this is, we think, the only ground on which the use of the terms to which we have alluded could be defended, and they are certainly not more expressive than their English equivalents. It must, also, have been noticed, that Mr. Wilson is very fond of coining or adopting names derived from the Greek; and to such an extent is this done by him, that, as we remarked a short time ago in speaking of modern ophthalmological literature, a special dictionary is almost needed for the comprehension of the literature of skin-diseases. We confess that we have difficulty in dealing with the question of the advantage or disadvantage of the words of Mr. Wilson's coinage and adoption—such, we mean, as Dyschromatodermata, Idrosis, Chromidrosis, etc. It must be said of many, if not of all, that they are very expressive, and that it would be difficult to find a single English word capable of so accurately conveying the idea implied. To those who are able to master and retain in their minds the etymologies of the terms, such words can present no difficulty; but those who do not possess this advantage, must at best use them empirically, and by an effort of memory affix the proper meaning to each. It is but fair to say, that Mr. Wilson does what he can to render the terms intelligible and to shew their application. Thus, in the tenth chapter, on Developmental and Nutritive Affections, we have the following definition of certain words.

"If we assume the skin to be entirely abnormal in its character, to be dry, hard, thin, inelastic, brittle, discoloured, rough, scaly, and in parts too small for the body it has to contain, we shall then have a fair word-picture of a state of disease to which we give the name of *xeroderma*, or dry skin (*ξηρος, aridus*). If, in the next place, we regard only the surface, and look upon an epidermis which is rough, uneven, sordid, broken up into rugged plates, or into smaller fractions corresponding with the area of the lines of motion of the skin, we shall then have suggested to us the idea conveyed by the term *ichthyosis* (*ἰχθυα, fish-skin*), a scaly covering like that of a fish. If, in addition to these two conditions, we suppose an altered state of the sebiparous function, and an accumulation of the sebaceous substance on the skin in

the form of dark grey or greenish scales or spines, suggesting the idea of the coat of a lizard (*σαυρος*), we then have a form of the affection to which we have attached the term *sauriosis*. Or if, instead of the extreme degree of abnormality indicated by these terms, we have before us a skin which is less dry, less hard, but equally, or even more, discoloured—that is, sordid, or, in other words, apt to the accumulation of concretions of the exuviae of the sebaceous and epidermic matter on the surface, which has originated in a previously healthy skin, and which has come on by degrees, which is, in fact, a disease, and has originated out of morbid causes, we shall then have a state which we have denominated *cachezia cutis*." (Pp. 242-3.)

Besides the two chapters to which we have already alluded, the book contains nine others, in which the author treats of the various groups from Eczematous to Hypertrophic and Atrophic Affections inclusive. In general, the descriptions given by the author are plain and simple, and calculated to be easily mastered by students; and at the same time to give them instruction which will be of value to them in practice. We have no doubt that the book will rapidly acquire and increase in favour; and this will be no more than it deserves.

Having disposed of Mr. Wilson, of whom every one has heard, we now come to Mr. WILKINS WILLIAMS, the latest accession to the ranks of English writers on skin-diseases, and whose name will probably be new to most. Mr. Williams does not, he says, pretend to originality, but adopts the French system of classification; he believes that the French dermatologists—especially Hardy, Bazin, Rollet, Diday, and Langlebert—have done that in the classification of skin-diseases which the English, adopting mere outward characters as their basis, have failed to do. In his preface, he says:

"A good book in this department of medical science has long been a *desideratum*. That there are three or four most able and elaborate treatises on skin-diseases in the English language, I am the first to admit; but I feel sure that I merely re-echo a general complaint in asserting that their bulk detracts sadly from their usefulness, and that they are scarcely on a level with the most recent researches made in this department, especially by the French dermatologists. These defects I have endeavoured to avoid in the present volume, which I hope will be found convenient in size, sound in practice, and well 'posted-up', as our American cousins say, in each branch of the subject of which it treats."

Mr. Wilson's work, which we just now noticed, had not appeared when Mr. Williams undertook his task; or otherwise the latter gentleman would assuredly not have employed the "*μεγα βιβλιον μεγα κακον*" argument as a reason for coming forward in print at the present time.

The classification of skin-diseases adopted by Mr. Williams is into Dartrous, Arthritic, Syphilitic, and Scrofulous Eruptions. The book will be interesting to those who desire to have a fairly digested outline of French doctrines regarding the classification, etiology, and treatment of skin-diseases. That its merits are such as to entitle it to take rank as a first-rate English authority, is more than we can conscientiously say of it.

One word of advice, in conclusion, we would give to Mr. Williams; and it is, to remove in his next edition the preliminary title "*A Clean Skin; how to*

get it and how to keep it." It gives the book too much of the appearance of being written *ad captandum*; and would be quite as applicable to a treatise on washing and bathing as to one on "Skin-diseases of Constitutional Origin."

WE beg to remind the members of the Association that the annual subscription for 1865 became due on January 1st. Payment of the same can be made either to the Honorary Secretaries of Branches; or to the General Secretary, T. Watkin Williams, Esq., 13, Newhall Street, Birmingham.

British Medical Journal.

SATURDAY, MARCH 18TH, 1865.

LAW AND INSANITY.

THE law of the land regarding the responsibility of criminal lunatics is interpreted by the judges in this way. If the criminal know that he is perpetrating a crime, when he commits (for instance) an act of murder, he is a moral and responsible agent, he knows right from wrong, and he must die. There is no such thing as homicidal mania. There is no such thing as a moral insanity. The law cannot admit such a thing as an uncontrollable impulse to destroy life.

This is the position assumed by the law; and on this position judges base their administration of it. We will not now ask, how such conclusions came to be adopted by the law; whether those who framed the law did or did not make themselves fully acquainted with the pathological states of the body comprised under the term insanity; whether it is reasonable, or indeed possible, for those persons to frame just laws who have only a very partial knowledge of the subject matter about which the laws they are framing are concerned; whether it is wise or reasonable to lay down legal dicta in regard to lunacy which are in distinct opposition to the unhesitating opinions of every scientific man of every country who has made insanity his special study and the business of his life; whether, in framing laws touching the lunatic condition of man's mind, it is reasonable or not to seek advice from those who have been all their lives engaged in the study of lunacy, and in dealing with lunatics.

But we would earnestly ask those judges of the land who are certainly responsible for the framing of the law and its interpretations, how they can reconcile their position with the following positive facts. We call them positive facts, because the truth of them may be most readily obtained by the personal experience of any one who will give himself the trouble to see and hear for himself.

The man who knows that he is doing wrong when he commits murder, dies according to law. Now to

this we answer: There are in every lunatic asylum in this country, individuals who, if they should manage to commit an act of murder, ought inevitably to be hanged in accordance with this law. There are individuals who so well know that the murderous act to which they are impelled is sinful, that they actually go and voluntarily incarcerate themselves, so as to be put beyond the power of committing the fatal act. They are horror-stricken at the very thought of the deed to which they feel hurried on by some "uncontrollable impulse." Judges may deride the term "uncontrollable impulse"; but it is, nevertheless, a positive fact. There is something more than a mere figure of speech in that evil impelling agency which went out of the madman and entered into the herd of swine. Every person at all conversant with lunacy must close his eyes to the most plain every-day facts, if he were to refuse to admit that men are oftentimes driven on by uncontrollable impulse to do wicked acts, knowing that the acts are wicked, and yet unable to restrain themselves from their commission.

In that particular form of mania, again, called puerperal—the mania of women, which sometimes follows upon childbed—the mother becomes melancholy, and is at times seized with an "uncontrollable impulse" to destroy herself, ay! even to destroy her own offspring—the doting mother murdering her own beloved child—and she is horrified with herself all the time, because of the dreadful crime to which she feels impelled. Does such a woman (becoming a murderess) deserve our deepest sympathy; or ought she to be handed into the hangman's hands? Let the administrators and makers of the law tell us what view they would take of the case, if such an event should occur in the bosom of their own families. Would they then say that the legal dictum which consigns such an unfortunate woman to the halter is just and good? But such a temporary insane state is, as every medical man knows, not at all unfrequently observed in women after childbirth.

As a striking example of the insane condition of mind observed in man, we might refer to the case of a late member of Parliament, which, some time since, was in everybody's mouth. This gentleman, feeling an uncontrollable impulse that he would murder some member of his family, voluntarily made himself a dweller in a lunatic asylum. Could any better proof be given of the fact, that a man can be of insane mind, and yet, at the same time, have a perfect knowledge of right and wrong. To find admission into the lunatic asylum, two medical men at least must have certified to his lunatic condition of mind; the superintendent of the asylum must also have so certified; and the Commissioners of Lunacy must have eventually ratified his admission. Yet, notwithstanding all this, according to the law of

England, as administered and interpreted by the judges, such a man, so situated, if he commit a murder, must die by the hangman's hands. But would any living soul think of bringing under the penalty of the criminal law an individual who, while thus affected, commits a murder in a lunatic asylum? Assuredly not. Then, we would ask, on what principle of reason and of justice ought the man, who is affected in a precisely similar way, and who destroys a life, to be hanged, merely because he had not the good luck to have been shut up in a lunatic asylum? Until we have some explanation of this manifest contradiction in facts, we shall be obliged to maintain, that the law which condemns the criminal lunatic to execution under the conditions here stated, is an iniquitous law, and is opposed to the dictates of science and of humanity.

We would just add one word in answer to those men of law who say to the doctors, If you had your will, every murderer would be turned into a lunatic. Our reply to the mis-statement is this. Try the reputed murderer by the same measure that you try the man suspected of incapacity in his civil affairs. If there be found in him sufficient evidence of insanity to justify the examining doctor in consigning him to a lunatic's restraint, then admit his insane condition. Let this be the plain and simple test. *If the murderer present no such signs of unsoundness of mind as would warrant or justify the examining physician—a Government expert—in certifying to his lunacy, let him be pronounced as sane.*

On each recurring assizes, some painful illustration of the above facts is brought before the public. Last week, at Derby, a man has been left for execution for the murder of his wife; and yet it is impossible to read the case without being impressed with the idea that the murderer is a lunatic. The facts of the case, on the side of the murderer, are stated as follows in the *Times*.

"The fact, that the woman died by the prisoner's hand, was virtually admitted, and the whole contention turned upon the state of the man's mind. Upon one side, the previous history of the prisoner, the fact that insanity had already shown itself in three other instances, and his delusion as to his wife's intimacy with Stone, were dwelt upon. The very circumstances of the crime, it was contended, pointed to insanity. The frantic violence, the subsequent calm, the friendly feeling the prisoner had always expressed for Stone, his parting from him on the fatal night—all showed madness. For what purpose had the prisoner so earnestly besought the daughter to sleep there that night, unless it was that deep down in the very springs of his life the man felt his enemy approaching him—felt the coming madness throwing its shadow before—and desired to have some one there to protect him from himself? The very mode in which the act had been committed was that of an insane man. After the fatal thrust was given, the prisoner must have arranged the body, which was found with the wound covered up by the clothes, which were laid smoothly and evenly up to the chin. Who but a madman could have done this? Again,

who but a madman would have insisted on taking the policeman home to find the dead body of the murdered woman? Again and again he had opportunities of escaping, and again and again he refused to avail himself of them. His conduct on approaching the house, if it were not that of a madman, was that of a being scarcely human in its brutality..... Besides this, it appeared that he had always been very eccentric in his manner, occasionally staring fixedly at one or other of the inmates of his house, upsetting the table without any apparent reason, and breaking the furniture. He would mutter to himself, and when spoken to would often turn away without making any answer. Some six or seven years back, he had been struck with a jug, and since then his conduct had been more strange than before, and he had complained of his head. Eleven months back he had, as he supposed, an illness, and was about to die; but the surgeon who attended and examined him could find nothing the matter with him, notwithstanding which the prisoner insisted on keeping his bed for three weeks. Lately, he had complained much of sleeplessness. He was very low in spirits; and his aptitude for business had so diminished that he had lost his occupation. On two occasions he had gone to one house when sent to another to make a distress; and at another time had left a house of which he had been put in possession without any cause. On the morning preceding the murder, he was found counting a pound's worth of silver, and counted it three times wrongly. On one occasion, he had pursued his wife and daughter into a neighbour's house, and had gone up to the window making grimaces and gesticulating in such a strange manner that the neighbour with whom she had taken refuge advised her to have him sent to an asylum."

The counsel for the prosecution insisted that the man knew right from wrong.

"The law on the subject had been laid down by wise and great judges; and the real question for them was, did the prisoner know the nature and consequences of the act he was committing? Brutal as the circumstances attending the death of the deceased were, when dispassionately considered, they showed, no doubt, a weak intellect, but one not incapable of distinguishing right from wrong."

Mr. Gisborne, the surgeon of the gaol, considered the man sane.

"Mr. Gisborne, who, it will be remembered, was called for the defence upon the recent trial of Townley at this place, on this occasion appeared to give evidence for the prosecution. He had noticed a peculiarity of manner in the prisoner; but saw no reason to consider him insane.

"On cross-examination, this witness admitted that the symptoms might be indicative of insanity. Lowness of spirits, melancholy, sleeplessness, groundless jealousy, especially when directed against those most nearly connected with him. He considered the prisoner a man of feeble mind—a man of weak intellect—and very obstinate, with some portion of cunning. Those characteristics frequently accompanied insanity. In the conversation he had had with the prisoner, the latter answered rationally to nearly every question that was put to him. The exceptions were questions relating to his crime. The appearances presented by the prisoner were quite consistent with his knowing the nature of his act and the consequences of it. They were also consistent with the existence of insanity."

Mr. Greaves of Derby gave evidence in favour of the prisoner's insanity.

"He stated that he had attended the prisoner when he lay in bed three weeks with nothing the matter. His conduct on that occasion might be accounted for by supposing that he was then in an early stage of insanity. Nothing else would satisfactorily account for it. The evidence given was entirely consistent with the notion that the prisoner at the time of killing his wife was labouring under a fit of insanity. The existence of an insane delusion was consistent with quiet behaviour at times; at other times it might cause great excitement and violence. A person subject to causeless jealousy, sleeplessness, the making of frequent mistakes in business, and low spirits, would be likely to be attacked by a fit of acute madness. During such a fit the patient had scarcely any or no control over his actions."

In the very same journal which gives these details, we find another trial for murder, and also of the murder of a wife by her husband. In this case, however, the murderer has been brought in a lunatic. But let any one read the evidence, and say if they think the proof is one whit less sure in the one case than it is in the other.

"The prisoner had been unwell for some time, and had gone with his wife and his wife's sister to his brother-in-law's house at Preston. On the night of his arrival, Mrs. Leitch and her husband were disturbed by loud screams proceeding from the prisoner's bedroom. On going there, they found the prisoner's wife at the window screaming, and her throat bleeding, and the prisoner with a knife in his hand trying to cut his own throat. On the prisoner being taken into custody, he appeared collected, and to be able to give an account of what he had done. After he was in custody, he made several statements to the effect that he knew what he had done, and that he was sorry for it, and that he was going to drown himself.

"On behalf of the prisoner, it was elicited that the night before he had been in a very desponding way; and had said that he should drown himself, that he had no home to go to, and that some persons were going to stone him. He passed sleepless nights. It was also proved that a few weeks previously he had been in a very desponding state of mind, and had said that he would drown himself. It also appeared, that a week before the murder a doctor had seen him, and advised his friends to place him in a lunatic asylum; and that the doctor had taken a knife from the table, and had told his wife to remove it and prevent his having any weapons about. Several medical witnesses gave evidence that the circumstances proved indicated monomania, and that there was nothing inconsistent with his being in a depressed and unsound state of mind, and while in that state committing an act of violence prompted by monomania, and his shortly after being able to give a collected account of himself and what he had done, and that the blood he had lost from the wound inflicted on his throat would contribute to bring him to himself.

"The jury then retired; and, after an absence of nearly two hours, returned into court, and acquitted the prisoner on the ground of insanity."

The results of these two trials strikingly exemplify the defective condition of the law which deals with criminal lunatics. Few, we apprehend, can read them without feeling that it was unfortunate for the man who is left for execution that he was tried at

Derby, the scene of Townley's acquittal. No one can, we should think, reflect upon these two similar cases—most similar in the condition of the minds of the two murderers when they killed their wives—without feeling that justice has failed in its dealings with one case or the other; that the justice which has spared the one and left the other to the hands of the hangman, cannot be justice with even-poised scales.

THE MEDICAL COUNCIL.

We last week took a brief survey of the doings of the Medical Council during the first septennial period of its existence. We found that its positive acts up to the present moment consisted, first, in the publication of a *Register*, of which very few of us can appreciate the advantages; and, secondly, in the issuing of a national *Pharmacopæia* (having, by the way, nothing national about it, except the title of British), which has been unthankfully received by every medical man and druggist in the country, excepting, perhaps (though of this we are not sure), the gentlemen who compiled it. Being by Act of Parliament a Council of Medical Education, established for the purpose of settling the medical education of the country, and being composed of the *élite* of all the educating and examining medical bodies of the country, the Council has naturally been expected by the profession to hatch before this some golden rules for the guidance of the rising medical generation. But eggs of this kind, it appears, require at least seven years to hatch—how much more, we have yet to learn. The period of incubation of the Medical Council has not yet been settled; and we fear there is no accoucheur sitting on the Board who can give us any information as to when the delivery may take place. Indeed, we have heard it doubted whether the Council is really pregnant with any viable offspring; whether it may not, in fact, be what the midwives call "entirely out" in its calculations. However, we shall watch with interest its approaching term; and, if it then show no signs, we shall assuredly conclude, either that abortion has taken place, or that the pregnancy has been assumed.

In the meantime, our readers may be curious to know what this negative action has cost the profession—"the worst paid and poorest of all the professions"—and we will, therefore, here make a few extracts from the balance-sheet of the Medical Council, which has just been published.

The Medical Council has received during the past year £4520, in fees from those seeking the honours and advantages of registration; £315 for the sale of its *Register*; £5555 for sale of *Pharmacopæias*. Then, *per contra*, we find expended during the year as fees and travelling expenses to members of Council, £2550; for *Pharmacopæia*, £4123; for salaries, printing, etc., £3100.

Consequently, the Medical Council has expended about £5500 in the last annual performance of its duties. The *Pharmacopœia* has altogether cost £6129; but then sales of it have produced £5555—12,837 copies of the 8vo. edition and 4030 of the 32mo. edition having been sold. For law (incurred in 1863), the Council paid £118; the special reporting of last year's proceedings cost £177; printing the *Register*, £513; the salaries of Registrar and Clerk, £450; and, as a set-off, we have, received on sale of *Registers*, £315. A good balance still remains in hand. The English Branch has £21,000 in the 3 per cent. consols; Scotland, £2000 ditto; and Ireland, £2400. Of the Branch expenditure during the year, we find the English with a good balance in hand, £2176; the Scotch, also, can boast of £390 on the right side; but Ireland is unfortunate, for we see written down against her a deficit of £173.

THE Metropolitan Counties Branch has a Committee, consisting of above thirty members, entrusted with the duty of guarding the interests of the medical profession whenever they are affected by parliamentary or governmental measures. In the performance of this duty, the Committee decided lately on sending a deputation to the Postmaster-General, in order, if possible, to obtain an uniform and fair remuneration for medical referees under the new Government Insurance and Annuities Act. This deputation accordingly waited on the Postmaster-General on Wednesday last; and a brief account of what took place on the occasion will be found at another page. It will be at once seen, that the efforts of the deputation were unfortunately counteracted by the readiness with which a large number of medical men have accepted the proposal of the inadequate fee of half-a-crown; and still more by the approval of the Postmaster-General's scheme expressed by the *Lancet*. Lord Stanley of Alderley, in fact, quoted the approving passages from the *Lancet*, in answer to the forcible arguments brought forward by the deputation. Says the *Lancet*:

"The fees" (5s. for sums from £60 to £100; 2s. 6d. for sums below £60) "appear to be sufficiently liberal, when we consider the large number of proposals likely to be made, and certainly fair in proportion to the small sums assured, or if taken in comparison with the fees paid by ordinary life assurance offices. The apparent difficulties and minutiae which require attention in the reading and filling up of the forms of report will gradually diminish as tact and experience are acquired in the mode of examining lives proposed."

THE Committee appointed by the College of Physicians, to consider the condition of the army and navy medical officers, will, it is understood, deliver in their Report at the next meeting of the College, so as to give the College an opportunity of taking action

(if so it please) by bringing the matter before Parliament during the present session.

THE members of the Pathological Society are deeply indebted to Mr. Timothy Holmes for having generously undertaken and performed the very laborious task of supplying them with a general index of the fifteen published volumes. Their excellent President, Mr. Prescott Hewett, has also put them under an obligation by bearing the expenses of its publication, and presenting it to the members.

M. MILNE-EDWARDS, in his funeral oration of M. Gratiolet, speaks thus of his sudden death:

"On the 15th of February, about the middle of the day, M. Gratiolet suddenly felt extremely ill; he seemed to lose his respiration; his legs could scarcely carry him. He recognised in these symptoms precursory signs of that violent kind of effusion which rapidly impairs the instrument of thought, and destroys life. His powerful intellect, however, remained intact. He prescribed with perfect clearness the means to be taken to combat the progress of the disease; he called for the consolations of religion; he sent for a companion of his youth; and he left to the friends of science the care of his young family. He then soon fell into a lethargy, from which nothing could rouse him; and he died at six o'clock on the following morning."

IN France, M. Jolly tells us, the revenue on tobacco was, in 1832, 28 millions (*francs*), about the same that it had been since 1792; two-thirds of the tobacco being employed as snuff. In 1842, the revenue was 80 millions; but now two-thirds of the tobacco was used for smoking, and only one-third as snuff. In 1852, the revenue reached 120 millions; three-fourths of the tobacco being consumed in smoking. In 1862, the revenue was 180 millions; and only a fifth of it was used as snuff. In 1863, the revenue was 216 millions. Hence it appears that "snuffing" has continued stationary since 1832, whilst smoking has rapidly increased. And it is worthy of remark, that in those departments where the individual consumption of tobacco is greatest, smoking is much more carried on than snuffing; whilst in those departments where the consumption is smallest, more tobacco is consumed in snuffing than in smoking. M. Jolly then makes a calculation to show that each smoker consumes eight *kilogrammes* of tobacco *per annum*—

"A quantity which, according to chemical analysis, is equivalent to from fifty to sixty *grammes* of nicotine—that is, to more than would suffice to destroy a squadron of cavalry! Few are they," he adds, "who deny themselves the pleasure of smoking. Tobacco has triumphed over the instincts of the organism, over the protestations of science and of reason, and over every coercive power employed to oppose it. It has worked a revolution in social and domestic economy, in public and private manners and habits, in the finances of the state, in public health, and has even had an effect on the progress of population."

Special Correspondence.

LIVERPOOL.

[FROM OUR OWN CORRESPONDENT.]

I ONCE more resume my correspondence, after an unavoidable interruption of many months. This first letter of a new series I propose to devote to a subject which, although not strictly local, may perhaps prove interesting to your readers, especially to those who may desire information on the particulars to which it refers. Having, during the interval since my last communication, made a voyage up the Mediterranean, including a sojourn of a month at Malta, in search of health, some hints founded on my personal experience may be useful to those who contemplate a similar undertaking themselves, or who may desire to recommend it to their patients. I would premise that, to those who require a thorough change of scene, with complete cessation from corporeal fatigue and mental anxiety, to recruit the wasted energies of mind and body, I can conceive no means better adapted to the purpose than the trip I am about to describe, especially when economy is an important consideration.

Several lines of steamers are constantly sailing from this port for the East; but the favourite vessels, and those which afford the most comfortable accommodation for passengers, are the splendid screw-steamers of the British and North American Royal Mail Steampacket Company,* which leave the Mersey about every fortnight, taking alternately three distinct routes—namely, the Italian route, by way of Genoa, Leghorn, and Naples; the Adriatic route, by Palermo, Messina, Corfu, Trieste, and Venice; and the Turkish route, by Malta, Syra, Constantinople, and Smyrna. In addition to the ports named, each steamer touches at Gibraltar on the voyage out and home, and at Malta on the way home. The voyage is also usually prolonged to Alexandria; but this extension of the trip depends upon the fluctuations of commerce. Passengers holding a ticket for the round can remain at any of the ports touched at, and resume their journey by a succeeding steamer. They have the privilege of living on board during the entire voyage, including the period of detention at each port; by which they avoid the expense, and in many instances the extreme discomfort, of foreign hotels. A stay of a week or ten days at the principal ports, such as Constantinople and Alexandria, and one or two days at smaller places, affords the traveller an opportunity of seeing the lions; and the constant change from sea to shore renders the trip

most agreeably free from the tedium of a long voyage. The longest runs on the Turkish route, to which my observations are limited, are from England to Gibraltar, which averages six days' steaming; and thence to Malta, about a day less. With these exceptions, the vessel is never at sea, if all goes well, more than two or three days together.

The Bay of Biscay, of which so much has been said calculated to alarm landsmen, has, so far as my experience goes, been greatly maligned; but, in point of fact, steamships on this voyage scarcely enter the Bay at all, but cross the Atlantic to the westward of the Bay, as a glance at the chart will show.

The difference of temperature, after leaving England, is sensibly felt on arriving off Cape St. Vincent; and at Gibraltar, the weather (in February) is as mild and genial as a warm May in England. Gibraltar is by no means an undesirable place for an invalid to make a short stay in the proper season—any time from the beginning of February until it becomes too hot. The Almeda is one of the most beautiful resorts for out-door exercise that could be found. Shady trees, luxuriant flowers, and an indescribably magnificent view of sea and land, including the beautiful Spanish coast and the mountains of Africa in the distance, are all that the lover of Nature could desire. The hotel accommodation is very good, and not unreasonable; but lodgings are scarcely to be procured on any terms.

In recording my experiences of Malta, I shall avoid repeating what has been written in works on climate, and confine myself to the impressions gathered from personal observation and inquiry from my friends there, both lay and medical, whose lengthened residence on the island enabled them to speak with confidence.

As a winter residence from October to May, Malta is most delightful. My friend Dr. Ward, who has spent some ten or eleven winters there, describes a Maltese winter as being somewhat better than a fine English summer. It is not suited to persons suffering from phthisis, unless in the very early stage; as, in certain states of the weather, phthisical patients appear liable to attacks of congestive bronchitis; but those in whom organic disease has not far advanced may, with ordinary precautions, avoid any risk of aggravating their symptoms. The advice I should give to those who select Malta for a residence is, to avoid Valetta, the principal town, as a permanent abode. The innumerable steps which must be climbed by the pedestrian are a sore trial, rendered memorable by Byron in his pithy farewell to this fortress:

"Adieu, ye cursed streets of stairs!
How surely he who mounts you swears."

Besides which, the long, narrow, and straight streets, running at right angles, with the lofty palaces of the old templars on each side, constitute tunnels, through one or other of which a sharp cutting wind is often blowing; so that the visitor, on turning a corner, finds himself suddenly transferred from the temperature of the torrid to that of the frigid zone. In this respect, Valetta appears some-

* Better known as the Cunard line, and locally as Maciver's steamers. For speed, seaworthiness, efficiency of officers and crew, and general equipment, these vessels are unrivalled; and, with the exception perhaps of the Peninsular and Oriental Company, are vastly superior to any other English line on the Mediterranean. The passage money for the entire round, inclusive of everything, excepting wines and spirits, is, I believe, about £40. As a graceful acknowledgment of gratuitous services to two of the public charities of the town, your correspondent was complimented with a free passage by Charles Maciver, Esq., the liberal and enterprising head of the firm.

what to resemble Madrid. Each street, too, has its own peculiar odour, which is by no means refreshing or agreeable to most English tastes. The origin of these perfumes seems to be decaying oranges, rancid olives, burnt olive-wood (which is the fuel of the Maltese), and other indescribable processes. To secure the full advantage of the Maltese climate, the invalid must leave the town, and take up his abode in the country; for this barren rock is not destitute of some delightful rural retreats. Those, however, who may have occasion to stay at Valetta, will find in the hotels accommodation in a style vastly superior and at a cost infinitely less extravagant than at home. A sojourn of a week at the Imperial Hotel at Valetta enables me to recommend with confidence that establishment to all who may pay a visit to Malta.

The best situation in the island for permanent residence is Sliema, a suburb of Valetta, separated from it by the Marsa Muscetta, or Quarantine Harbour, across which small ferry-boats are plying every few minutes through the day. It is the summer resort of the opulent citizens of Valetta, and is in every respect a most salubrious and agreeable seaside residence. There is no difficulty in finding comfortable lodgings. I was fortunate enough to secure accommodation in a pleasantly situated villa occupied by an English, or rather an Irish lady, who provided everything necessary for domestic comfort, except wine, for about six shillings a day. In selecting a lodging, it is important to secure a sleeping-apartment which is above the ground-floor, because the porous nature of the rocky foundation of the island renders all the lower rooms more or less damp. It is also desirable to notice whether the sitting-room is provided with a fireplace—a luxury not invariably indulged in by the native Maltese, but which may sometimes be found necessary to ensure the comfort of the English visitor, especially if he be an invalid.

Some precaution seems necessary against the possibility of *coup de soleil*; for although Dr. Edwards, the English physician at Valetta, assured me that he had rarely met with cases of this very serious affection, yet from other sources I learned that it has occurred; and, against such a malady, prudence would suggest even superfluous caution. It has been observed that, contrary to what might have been supposed, it is not in the hottest season that this affection most frequently occurs, but that especially in the month of March sunstroke is most to be dreaded. The simple preventives are, to avoid exposure to the sun without a suitable covering for the head, and especially for the back of the neck; the upper part of the spinal column being quite as liable to suffer from the injurious effects of direct solar heat as the brain itself. The premonitory symptoms of sunstroke have been described as a sensation as if a very fine needle had been passed through the brain; without producing, however, more than a comparatively trifling feeling of pain.

There is another peculiarity in the climate of

Malta, of which invalids should be made aware; namely, the sudden fall of temperature which frequently occurs immediately after sunset. There is no twilight to remind him of the approach of night; and, unless forewarned, he may unexpectedly find himself suddenly exposed to the damp and chill of the evening air; to avoid which, care should be taken not to remain abroad too long, and never to take a long excursion late in the day without a cloak or overcoat, even in the hottest weather.

The luxury of sea-bathing can be enjoyed here during the proper season with much advantage. The indentations in the rocky margin of the island form natural baths of liquid crystal, which are irresistibly tempting. But some precautions are necessary. The native Maltese never commence their bathing until the summer is somewhat advanced, in accordance with a religious observance, which fixes a certain saint-day as the legitimate commencement of the season, after which they almost live in the water. For visitors, the proper time to commence bathing is about the end of May. Before that time, some risk is incurred, as it has been found that, from some peculiarity, bathers are liable to attacks of a febrile character, which are sometimes serious, and even dangerous. It has been suggested, that this peculiar effect of the sea-water during a certain period of the year depends upon the admixture of fresh water which falls into the sea during the rains in the winter months. Whatever may be the true explanation, the fact is undoubted, and has been so strongly impressed upon the military authorities that, in consequence of the frequent occurrence of the affection alluded to amongst the soldiers when they were allowed to bathe as early in the year as they pleased, a regulation has for some time been in force prohibiting the men from going into the water before the proper season has commenced; and since that time the peculiar sickness alluded to has disappeared.

In connexion with military matters, I may mention that a partial recognition of the importance of preventive legislation, in reference to syphilitic disease, has produced the greatest possible benefit in the garrison here. Every soldier, on reporting himself sick, and found to be suffering from primary disease, whether syphilis or gonorrhoea, is handed over to the police, who accompany him to the residence of the woman from whom he suspects the disease was contracted, and at once remove her to the hospital. The result of this admirable arrangement is, that, as one of the surgeons in charge of the military hospital informed me, syphilis is one of the rarest affections met with amongst the men; while at Gibraltar, where no such regulation is carried out, that disease is as prevalent as it usually is amongst a large military population.

A residence at Malta must not be prolonged much beyond the month of May—at least, by valetudinarians. The weather then becomes so intolerably hot, especially at night, as to be most trying to the English constitution; and even the natives complain se-

riously of its depressing effects. I have been assured that the heat is even less endurable than in India; and, contrary to what might have been expected, the system appears to resist the modifying influence of acclimatisation. The first summer is generally borne better than the second; while the third frequently so thoroughly prostrates the system as to render it necessary to resort to a more bracing climate for a time.

In selecting the Turkish route for invalids who desire to avoid cold weather throughout the trip, the departure from England should be timed so as to reach Constantinople not earlier than the end of April or May; for the spring there is variable, and often cold. During my stay in April, we had both rain and snow. But it is worthy of remark, that I found the effects even of severe cold much modified by the peculiarity of the atmosphere, which has an exciting and exhilarating influence upon the system, contrasting most agreeably with the miserable discomfort and depression of spirits so often felt on a cold wet day in England.

As the so-called Turkish Bath has now become an English institution, a word or two about its prototype in Turkey may be interesting. I visited the largest and most celebrated bath in Stamboul, and noticed the following peculiarities in which the arrangements differed from those that I have seen in this country. The building is of colossal dimensions, divided into two compartments, one for dressing and undressing, and the other for the bath itself; so that the bather goes directly to and from the first to the second, without being subjected to the graduated processes of heating and cooling adopted in the Anglo-Turkish bath. The heated air is charged with moisture to such an extent as to fill the bath with an atmosphere of vapour. I did not ascertain the exact temperature; but it is probably lower than that of the dry air in the baths in England, and it is certainly much more agreeable. No cold water is used; but after the shampooing process, which is skilfully and pleasantly performed, chiefly by boys, the bather is washed with tepid water and soap, applied by means of a wisp of beautifully soft camel's hair, which appears better adapted for the purpose, and pleasanter to the skin, than either sponge or flannel. I think the managers of the baths in England might take some useful hints from the Turkish style of conducting these establishments.

In passing the barbers' shops in Constantinople, large glass jars are seen, containing frogs; and, on inquiring what they were used for, I was told by my interpreter that, in certain diseases, they were placed on the tongue, and allowed to jump down the throat; and, on reaching the stomach, the reptile was supposed to eat the peccant matter which caused the sickness. For the credit of medical science in Turkey, we may reasonably suppose that this is only a special form of quackery, not sanctioned or practised by Turkish physicians.

After leaving the Golden Horn, the steamer returns through the Dardanelles, passing Sestos and

Abydos, touching for an hour or two at Gallipoli; and in about forty-eight hours reaches Smyrna, whence there is usually an opportunity of visiting Ephesus by rail, if the traveller is so disposed. From Smyrna, the route is either directly homeward by way of Malta, or still further south, round by Alexandria; the question being decided by the rate of freights and the amount of cargo which the vessel has obtained. If the latter course is adopted, the detention at Alexandria is generally sufficient to admit of a visit to Grand Cairo and the Pyramids, which will amply repay the tourist, and is an excursion that may be ventured upon by an invalid who is strong enough to sit on a donkey for three or four hours.

The climate of Egypt is very delightful; but the English visitor must be prepared to submit to many privations. At Shepherd's Hotel at Cairo, which is reputed the best hotel in the East, the provisions were so unsuited to my English taste, and so unsustaining to my stomach, that I verily believe that, if my visit of three days had been extended to as many weeks, I should have been literally starved. The mutton closely resembled goat's flesh, and the beef that of camel or buffalo; and the salad seemed to be composed of coarse grass. The eggs were in various stages of decomposition. Hence, on the whole, an invalid with a languishing appetite or feeble powers of digestion, could only fare badly. It is right to state that, just at the time of my visit, a murrain amongst the cattle had produced a famine in the land; so that provisions, especially animal food, were very scarce.

One impression which is left upon my mind from the experience of this voyage, is the importance of giving due weight to the various discomforts and inconveniences to which the valetudinarian may be exposed, as a set-off against the benefits of climate and change of scene.

In my next communication, I shall revert to topics more strictly within the scope of local correspondence, by resuming a chronicle of passing events in this section of the medical world; and, if your readers are not yet tired of the all-absorbing yet far from exhausted subject of fever, may have something yet to record of the typhus epidemic, which, I am glad to say, appears to have begun to take its departure.

EDINBURGH UNIVERSITY. In memory of the late Sir William Hamilton it has been proposed to found a Fellowship bearing his name in the University of Edinburgh. The first six names on the list of the committee which is now engaged in prosecuting this design are the Duke of Argyll, the Bishop of London, the Bishop of Hereford, Lord Brougham, Mr. Gladstone, and Sir David Brewster. For the endowment of the Fellowship some £3,000 or £4,000 will be required. As the Scottish universities are sadly deficient in their endowments, and as a vigorous effort is now being made to raise the character of the education they afford, it is hoped that, both in honour of Sir William Hamilton and for the welfare of the universities which he had much at heart, Scotchmen out of Scotland will not be backward in their offers of help.

Association Intelligence.

BRANCH MEETINGS TO BE HELD.

NAME OF BRANCH.	PLACE OF MEETING.	DATE.
WEST SOMERSET. [Quarterly.]	Clarke's Castle Hotel, Taunton.	Wednesday, April 12, 7 P.M.
BATH AND BRISTOL. [Ordinary.]	Victoria Rooms, Clifton.	Thursday, April 13, 7 P.M.

COMMITTEE OF COUNCIL: NOTICE OF MEETING.

The Committee of Council will meet at the Queen's Hotel, Birmingham, on THURSDAY, March 23rd, at Three o'clock precisely.

Business. To receive communications from the President.

To receive the Treasurer's Financial Report.

To consider a communication from Dr. Davey to the President of the Council.

To consider the Laws of the Northern Branch.

To appoint adjudicators of the Annual Prize Essay.

To fix the time of the Annual Meeting.

Any other business which may be brought forward.

T. WATKIN WILLIAMS, *General Secretary.*

13, Newhall Street, Birmingham, March 7th, 1865.

SOUTH-EASTERN BRANCH: WEST KENT DISTRICT MEETINGS.

The next meeting will be held at the Infirmary, at Gravesend, on Friday, March 31st, at 3.30 P.M.

Dinner will be ordered at the Yacht Club House, at 5.30 P.M. Tickets 5s. each, exclusive of wine.

C. J. Pinching, Esq., will preside; and papers are promised by M. Adams, Esq. (Clinical Ophthalmic Cases), and by Dr. Bell (Craniotomy).

FREDERICK J. BROWN, M.D., *Hon. Sec.*

Rochester, March 11th, 1865.

WEST SOMERSET BRANCH.

A QUARTERLY Meeting of this Branch will be held at Clarke's Castle Hotel, Taunton, on Wednesday, April 12th, at 7 P.M.

Notice of papers or cases to be communicated should be sent to the Honorary Secretary previous to the meeting.

W. M. KELLY, M.D., *Honorary Secretary.*

Taunton, March 11th, 1865.

METROPOLITAN COUNTIES BRANCH.

THE GOVERNMENT ANNUITIES ACT: DEPUTATION TO THE POSTMASTER-GENERAL.

On Wednesday last, a deputation from the Committee appointed by the Metropolitan Counties Branch to watch the progress of such parliamentary measures as affect the interests of the medical profession had an interview with the Postmaster-General, Lord Stanley of Alderley, at the General Post-office. There were present at the deputation: C. F. J. Lord, Esq., President of the Branch; Dr. Sibson and R. Dunn, Esq., Vice-Presidents; Dr. G. Webster; C. H. Rogers-Harrison, Esq.; Dr. S. W. J. Merriman; W. Martin, Esq.; Dr. S. Gibbon; and Dr. A. Henry.

Mr. Lord said that the medical profession felt a deep interest in all that related to the progress of humanity and social science, and regarded the recently introduced measure of Government insurances and annuities as one calculated to be of great

benefit. But it was a matter of regret that the services which medical men would be required to render to the cause were placed at so low a value by those in authority as to be considered adequately remunerated by a fee of half-a-crown in many cases. Mr. Lord dwelt on the voluminous nature of the questions which the medical referee would have to answer. He quoted from an official circular, in which it was stated that the Postmaster-General proposed that the fee should be half-a-crown for the lower insurances and five shillings for the higher ones. He urged the propriety of establishing a uniform fee of five shillings, and of thus securing the cordial co-operation of the medical profession, without whose cheerful and sustained aid the movement could not permanently thrive.

Dr. GIBBON supported the remarks of Mr. Lord, and pointed out the practicability of the proposal made, by reference to the fees paid by other insurance companies, especially the Lancashire, which had been highly commended by Mr. Gladstone.

Dr. SIMSON warmly supported the proposal for an uniform five-shilling fee. He pointed out that the answering of the questions proposed would require a considerable amount of skill and time on the part of medical men; and that, while the amount of attention given to the case should be the same for small as for higher insurances, the low fees would be liable to induce many to perform the work inefficiently. He urged strongly the necessity of obtaining the cordial co-operation of the medical profession in carrying out the measure.

The POSTMASTER-GENERAL said that it was the duty of the Government to get work done at the lowest cost. He did not think the profession were dissatisfied with the low fees, as he had already received seven hundred letters of consent to his proposals. The *Lancet* had also approved the scale of fees proposed in his circular.

Dr. WEBSTER considered the conduct of the *Lancet* inconsistent in this matter, inasmuch as in past years the editor of that periodical had taken to himself much credit for procuring an increase of the fees paid to medical referees by insurance companies.

Mr. LORD, in reference to a remark made by the Postmaster-General, said that the principle of getting work done at the lowest cost was a dangerous one. It would, at least, not be acceptable to the various paid officers in the departments of the public service.

After some further conversation, the deputation, which had been most courteously received, withdrew, feeling assured that their attempts had been impeded greatly by the injudicious approbation of the low fees expressed by the *Lancet*.

THE LASH AND THE BRAND. A return made to the House of Commons shows that, in 1862, no single instance of branding or flogging occurred in the militia. In the cavalry regiments, but very few cases of flogging occurred; in no regiment more than three. The 31st Regiment has a pre-eminence for the number of lashes which were inflicted in its ranks, 33 cases having been so punished; and the 67th Regiment comes next with 26 cases. The others had many fewer. The 14th had 14; the 19th, 12; Rifle Brigade, 9; the 8th, 9. The number of lashes ordered was, in almost every case, fifty; and in very few instances was any part of the punishment remitted. The offences were in all places of a similar description: insubordination, violence to superiors, desertion, disgraceful conduct, making away with necessaries, habitual drunkenness, etc. In all, there were 379 cases; for which 18,600 lashes were decreed, and for which 18,180 were inflicted. There were 1493 men marked with the D, and 37 with the B C.

Reports of Societies.

MANCHESTER ROYAL INSTITUTION: MEDICAL SECTION.

ANNUAL MEETING, JAN. 11, 1865.

THOMAS MELLOR, Esq., in the Chair.

Report. The HONORARY SECRETARY read the Annual Report for 1864. The number of members amounts to 105, being the same as last year. The attendance has averaged twenty-six at each meeting, in place of twenty the previous year.

The Treasurer's Report showed the financial position of the Society to be satisfactory.

Officers and Council. The following gentlemen were elected office-bearers for the year 1865. *President*—Wm. Roberts, M.D. *Vice-Presidents*—J. Boufflower, Esq.; G. Greaves, Esq.; J. Robertson, Esq.; and J. Windsor, Esq. *Treasurer*—L. Borchardt, M.D. *Secretary*—J. Thorburn, M.D. *Librarian*—J. Roberts, M.D. *Committee*—C. H. Braddon, M.D.; H. Browne, M.D.; S. Crompton, M.D.; J. O. Fletcher, M.D.; E. Gumpert, M.D.; J. Hardie, M.D.; T. Mellor, Esq.; D. Noble, M.D.; A. Samelson, M.D.; H. Simpson, M.D.; J. Stone, M.D.; Thomas Windsor, Esq. *Auditors*—S. Nesfield, M.D.; A. Wahltsch, M.D.

ORDINARY GENERAL MEETING, FEB. 1, 1865.

WILLIAM ROBERTS, M.D., President, in the Chair.

Suppurative Nephritis. Dr. WM. ROBERTS showed a specimen of suppurative nephritis, in which both kidneys were thickly studded with purulent collections, varying in size from a pin's head to a horse-bean. The history of the case was defective; but the suppuration was supposed to be secondary to cystitis.

Dr. ROBERTS also showed a piece of wire in the omentum, found in a subject in the dissecting-room. There were no inflammatory traces, which is interesting, as bearing on the use of metallic sutures.

Tuberculosis of Urinary Organs. Mr. LEECH showed a specimen of general tubercular deposit in the whole of the urinary organs, from the kidneys to the urethra.

Calculus. Dr. J. O. FLETCHER showed a large calculus, which he had extracted from the urethra of a boy.

Syphilitic Ulceration of the Palpebral Conjunctiva. Mr. J. WINDSOR read a paper on Ulceration of the Palpebral Conjunctiva, generally involving the Tarsal Cartilage, and occurring as one of the Symptoms of Secondary Syphilis. Details were given of seven cases, which were all observed in his large experience, extending over a long period, showing that the affection is comparatively rare. It has been mentioned by Mr. Lawrence and some other writers, but has not attracted much attention. Mr. Windsor had noticed it usually in cases of the phagedenic form of ulceration; and the sores on the palpebral conjunctiva have appeared at a late period of the case.

An example will illustrate the character of the affection. In this case, the margins of the eyelids were somewhat red and swollen; and on everting the upper lips, two small ulcers were seen on one and one on the other lid. Each was a little excavated, with a yellowish base, and was about the size of a split-pea. They were all on the palpebral conjunctiva, quite within the ciliary margin, and, therefore, not observable until the palpebræ were everted. There

was a yellowish ulcer on the left tonsil, and some slightly phagedenic serpiginous ulcers on the legs. The treatment consisted of sarsaparilla, iodide of potassium, and occasional mild doses of mercury, with the local application of mild mercurial lotions and ointments.

Manchester Hospitals. Mr. WALSH read a paper on the Re-organisation and Extension of the Hospital and Dispensary System of Manchester.

Manchester is inadequately supplied with hospital accommodation for the sick industrial poor; possessing, in proportion to the population, only two-fifths of that provided by London and Liverpool. The dispensary arrangements are still more defective and unsatisfactory. Mr. Walsh proposed: 1. To amalgamate all the general medical charities of the city; to dispose of the property appertaining to each; and to place the sum realised in the hands of the trustees of the Manchester Royal Infirmary. This body would then possess funds amounting to at least half a million sterling. 2. To purchase a new site in an eligible situation in the suburbs, on which to erect a new infirmary which should supply at least three times the accommodation of the present one, and should be built on the most approved system. 3. To establish in connexion with the infirmary six dispensaries, located in the different centres of population throughout the city; each to contain a few beds for the temporary treatment of accidents of extreme urgency; to be in telegraphic communication with the parent house; and to be under the immediate charge of a house-surgeon of the infirmary. 4. A new class of medical officers to be created, and styled assistant-physicians and assistant-surgeons to the charity—the former to attend to the out-patient department of the hospital; the latter the out- and home-patients of the dispensaries. All these officers to be paid; and from their ranks all vacancies occurring in the higher appointments to be filled up. 5. Clergymen and medical men to have the privilege of sending patients to the charity (although not subscribers); and poverty not to debar any one from partaking of its benefits.

LIVERPOOL MEDICAL INSTITUTION.

FEBRUARY 9TH, 1864.

Depressed Portion of Skull causing Convulsions. By J. CAMERON, M.D. On January 25th, at 6.30 p.m., G. M., aged 36, was brought to the Liverpool Southern Hospital, from the police bridewell; the police officer stating that, having been found in his cart apparently drunk, he had been taken to the lock-up for safety; and, when there, had a fit. On admission to the hospital, he was conscious and able to speak. He was very much collapsed; the surface of the body being cold, the pulse feeble, and the pupils of the eye dilated. Respiration was attended with loud rattles. He was placed in bed; warmth was applied to the extremities; and stimulants given. He then gave the following account of himself. For the last ten years, he had been subject to fits, having had during this period somewhere about six. He started with his cart about three o'clock in the afternoon, and had no recollection of what had occurred since that time up to his admission to the hospital. He thought he must have had one of his fits. As he was in a low state, it was not considered advisable to make a thorough examination of the thoracic viscera; but he was considered to be suffering from pneumonia, the state of collapse being attributed to the long exposure to the intense cold (the day being exceedingly cold) whilst in a state of insensibility, and to his having taken little or no food during the

day. On the next day, he had somewhat rallied, though he was still too low to allow a more complete examination to be made. He complained *only* of chest symptoms, cough, and dyspnoea. On January 27th, he was in much the same state till the afternoon, when he became lower. Respiration was difficult; the face livid. He rapidly became worse, and died at 4.30 P.M., forty-eight hours after admission. On making an autopsy, twenty-one hours after death, with the exception of small bruises on the forehead, right lip, and forearm, and a larger one over the sacrum, there were found no external appearances worthy of remark. There was an old depressed fracture of the right parietal bone, causing a mark on the surface of the brain at the corresponding part. The depressed portion of bone was almost circular, an inch and a half in diameter. The vessels of the brain were congested. The brain was healthy. On removing the integuments from the chest, some clotted blood was found at the lower part, about the right nipple. The ninth right rib was found fractured about its middle; but there was no penetration of the pleura. There were small quantities of clotted blood in the right cavities of the heart; the left were empty. The left ventricle was hypertrophied and firmly contracted. Calcareous deposits were present in the aortic valves. The lower lobe of the left lung was in a state of red hepatisation; the right lower was congested. The bronchi were injected. At the apex of the right lung was a small deposit of tubercle. About a pint and a half of blood was found in the cavity of the abdomen. There was some clotted blood in the areolar tissue of the loins, and on the right side of the diaphragm. There was a rent of considerable size in the back part of the right lobe of the liver, containing clotted blood. The hepatic tissue in the neighbourhood of the rent was also infiltrated with blood.

In a medico-legal point of view, the case afforded an illustration of the receipt (probably by a fall from the cart whilst deceased was in a state of insensibility) of an injury severe enough to produce extensive laceration of the liver, without external marks to lead to a suspicion of the internal injury. It is also worthy of note that, during the forty-eight hours he lived, no complaint was made referable to the seat of the injury. With reference to the question of blood-letting in pneumonia, it is interesting to observe that in this case the disease, which probably arose from the exposure during intense cold on the day of the accident, steadily progressed to the second stage in the left lung and the first in the right lung, notwithstanding the copious hæmorrhage into the abdomen. The convulsions to which the deceased had for so many years been subject were due, we may presume, to the old depressed fracture of the skull; and it is perhaps worthy of record, that the brain-substance and membranes did not present any appreciable morbid alteration.

THE VACCINATION ACT. At Marylebone, J. Maunders, cabman, was fined five shillings at the instance of Mr. J. G. Gerrans, district vaccinator, for refusing and neglecting to cause his child to be taken to him for inspection upon the eighth day after vaccination, in compliance with the Vaccination Act, 16 and 17 Vic., cap. 100, sec. 3. This was the first case under the Act. Mr. Gerrans said that the defendant's child was the only one that he had for a week from which to get a supply of lymph, and on the day that the mother ought to have brought it there were a dozen women waiting in his surgery to be vaccinated. Mr. Yardley fined the defendant five shillings, or in default seven days' imprisonment.

Correspondence.

THE MEDICAL COUNCIL.

LETTER FROM JAMES HEYGATE, M.D., F.R.S.

SIR,—You have in this week's JOURNAL a strong leading article on the shortcomings of the Medical Council in regard to the subject of medical education. But what is the use of all this, whilst the Medical Act affords little or no protection to the legitimate practitioner, and whilst the Medical Council year after year fail in their duty to the profession in not applying to Parliament to have the clause in the Act amended which occasions this anomaly?

When the Medical Act first came into operation, those who assumed the title of "doctor" or "surgeon", and who had no claim to it, took the alarm, withdrawing these titles from their names—ceased to deceive the public in this respect; but it soon became apparent, from the glorious uncertainty as to how the different judges might and did decide on the reading of this clause, that the illegal assumption of titles soon became as rampant as ever; and the various registration societies formed in the country ceased to take cognisance of this unsatisfactory state of things. I think that this subject is of far more importance to the public; and that it is quite as much the duty of the Medical Council to use their efforts to see the failings of the Medical Act rectified, as to agitate again and again the question of medical education. I am well aware that some improvements might be made; but the standard of medical education is much higher than it was when I was a young man; and, though it is a subject on which you frequently touch, I have often thought that there are other grievances from which the profession suffer which demand an equal if not greater attention on the part of the Medical Council.

Pardon me for making these remarks; but, as the Medical Council is about to meet, it is as well that they should be again reminded of a grievance which I am persuaded the great body of the profession keenly feel.

I am, etc., JAMES HEYGATE.

Derby, March 11th, 1865.

[Surely the title of the Medical Council indicates its function. Dr. Heygate must forget that its title by Act of Parliament is, "The General Council of Medical Education and Registration". EDITOR.]

THE SOCIÉTÉ MÉDICO-PSYCHOLOGIQUE OF PARIS AND THE TOWNLEY CASE.

LETTER FROM C. LOCKHART ROBERTSON, M.D.

SIR,—I have received from a friend by this morning's post the annexed cutting from last Sunday's *Observer*.

"**THE TOWNLEY CASE.** The 'Medico-Psychological Society' of Paris, composed of the leading continental physicians engaged in the treatment of the insane, and connected with the principal lunatic asylums of France, regarding the grave medico-legal as well as public importance of the case of George V. Townley, deputed several of its more distinguished members—among whom were MM. Jules Falret, Brierre de Boismont, and Legrand du Saulle, etc.—to fully investigate and report as to this criminal's alleged insanity. It appears from a recent number of the *Gazette des Hôpitaux* that this official inquiry has terminated. The recent suicide of the prisoner (in a paroxysm of impulsive insanity, according to the finding of the jury), when viewed in connection with

his prior psychological history, has conclusively established (says the editor of the *Gazette*), to the satisfaction of every unprejudiced mind, that the opinion expressed at Derby by Dr. Forbes Winslow as to Townley's derangement of intellect was a right and scientific judgment of his mental condition." (*Observer*, March 12.)

This paragraph repeats more definitely the misstatement in the *Lancet* of the 4th instant, which you permitted me last week to correct; viz., that the Société Médico-Psychologique had made an official report on the Townley case in favour of Dr. Winslow's diagnosis at Derby. *This assertion, as I said in my former letter, is utterly untrue.*

I should, also, like to ask Dr. Winslow whether he approves of the frequent insertion in the weekly and daily press of similar statements of his "right and scientific judgments", etc., such as this paragraph in the *Observer*? You will observe, if you compare it with its original in the *Lancet*, how the story is here dressed up for the public. I am, etc.,

C. L. ROBERTSON, M.D.,

Membre-associé Etranger de la Société Médico-Psychologique.

Hayward's Heath, March 15th, 1865.

[Dr. Winslow will naturally say that he is not responsible for the indiscretions of other people. EDITOR.]

Medical News.

ROYAL COLLEGE OF SURGEONS OF ENGLAND. The following members of the College, having been elected Fellows at previous meetings of the Council, were admitted as such on March 9th.

Cox, Charles Lindsay, the Queen's Indian Army: diploma of membership dated May 18, 1833

Hemsted, Henry, Newbury, Berks: October 3, 1828

Pitman, Henry, the Queen's Indian Army: April 13, 1840

Sheppard, William Yeoman, Bristol: February 18, 1842

APOTHECARIES' HALL. On March 2nd, 1865, the following Licentiates were admitted:—

Libbey, Henry Cornelius, Dewsbury Road, Leeds

Simpson, Thornton Gerald, Westbourne Road, Islington

At the same Court, the following passed the first examination:—

Wright, William Evatt, Guy's Hospital

Admitted on March 9th—

Forster, Edward Wood, Newcastle-on-Tyne

Maturin, Henry, Lymington

At the same Court, the following passed the first examination:—

Brocklehurst, Thomas Howard, Manchester School of Medicine

APPOINTMENTS.

ARMY.

HENRY, Staff-Assistant-Surgeon R., to be Assistant-Surgeon Royal Artillery, *vice* W. D. Smythe.

JEEVES, Staff-Surgeon W. Y., to be Surgeon 25th Foot, *vice* D. D. McCay McDonald.

LEWIS, Staff-Surgeon J. H., to be Surgeon 18th Foot, *vice* W. Stewart, M.D.

MACKINTOSH, Surgeon-Major W. H., M.D., 21st Foot, to be Staff-Surgeon-Major, *vice* J. H. Lewis.

STEWART, Surgeon W., M.D., 18th Foot, to be Surgeon 21st Foot, *vice* W. H. Mackintosh, M.D.

ROYAL NAVY.

BRIETZKE, H., Esq., Acting Assistant-Surgeon, to the *Excellent*.

COMBIE, Peter, Esq., Surgeon, to the *Sparrowhawk*.

DONOVAN, Jeremiah, Esq., Assistant-Surgeon, to the *Torch*.

MACDONNELL, Henry, Esq., Assistant-Surgeon (additional), to the *Figard*.

McKENNA, Arthur, M.D., Surgeon, to the *Pelorus*.

STEWART, James, Esq., Acting Assistant-Surgeon, to the *Asia*.

WHITAKER, Joseph, Esq., Assistant-Surgeon, to the *Cambridge*.

VOLUNTEERS. (A.V.=Artillery Volunteers; R.V.= Rifle Volunteers):—

BICKERTON, T., Esq., to be Surgeon 1st Administrative Brigade Lancashire A.V.

CALTON, W. J., Esq., to be Assistant-Surgeon 1st Administrative Brigade Lancashire A.V.

CRAWFORD, G., M.D., to be Honorary Assistant-Surgeon 5th Renfrewshire R.V.

HULME, H., Esq., to be Assistant-Surgeon 1st Lancashire A.V.

MARSH, N. K., Esq., to be Surgeon 1st Lancashire A.V.

MILES, R., Esq., to be Honorary Assistant-Surgeon 12th Glamorganshire R.V.

PATERSON, G. R. H., Esq., to be Assistant-Surgeon 1st Administrative Battalion Perthshire R.V.

PYLE, T. T., Esq., to be Assistant-Surgeon 3rd Durham R.V.

THEED, F., Esq., to be Honorary Surgeon 1st Administrative Battalion Flintshire R.V.

WARKE, W. L., Esq., to be Assistant-Surgeon Liverpool R.V. Battalion.

WOLSTENHOLME, J. H., Esq., to be Quartermaster 1st Administrative Battalion Flintshire R.V.

DEATHS.

BATES. On February 26th, at Manchester, aged 34, Ellen, wife of William Bates, M.D.

CRICHTON. Sir Archibald William, M.D., D.C.L., many years Physician-in-Ordinary to the late Emperor Nicholas I, at St. Petersburg, aged 74, on February 15th (27th).

CURRIE. On March 8th, at Boulogne-sur-Mer, aged 72, Caroline Mary, widow of Claude Currie, Esq., late Physician-General Madras Army.

HILLMAN, William, Esq., Surgeon, at 1, Argyll Street, aged 51, on March 11.

LADBURY, John, Esq., Surgeon, at Kidlington, Oxfordshire, aged 63, on March 9th.

MARSHAL. On March 2nd, at Hammersmith, aged 64, Mary, widow of the late John A. Marshal, Esq., Surgeon, Aylesbury.

TURNER, Thomas, M.D., at 31, Curzon Street, aged 92, on March 10.

WAY. On March 10th, at Pullen's Row, Islington, Charlotte More, widow of the late John Way, Esq., Surgeon.

DEATH IN THE STREETS. Five persons last week died in London from carriage accidents.

VILLAGE HOSPITALS are rising up over the country. It is announced that one is to be started at Guisborough, in Yorkshire.

THE DEATH OF DR. STOESS at an advanced age, who first practised section of the tendo Achillis in France, is announced.

A NEW JOURNAL. The Branch of the French Medical Association des Bouches-du-Rhône has now its own medical organ, *L'Union Médicale de la Provence*.

BEQUEST. By will, Miss E. Hervey, of Park Street, Grosvenor Square, leaves to St. George's Hospital, King's College Hospital, Cripples' Home, and Cambridge Asylum, each £250, free of duty.

FRENCH MEDICAL ASSOCIATION. The Central Society of the French Medical Association has distributed 5,000 francs in assistance of indigent medical men, etc., during the past year.

SIR RUTHERFORD ALCOCK. This gentleman who it may not be generally known, is a member of our profession, although holding the high appointment of her Majesty's Minister at Japan, has just returned to England.

LADIES' SANITARY ASSOCIATION. Under the patronage of the Ladies Sanitary Association a syllabus of a course of lectures has been issued. One of the lecturers appointed by the ladies is, we understand, a practitioner in homeopathy.

ST. BARTHOLOMEW'S HOSPITAL is, we learn, to issue during the present year a volume of Reports—its first volume. The editors are to be Dr. Andrew and Mr. Callender—gentlemen well qualified for the duty.

BERLIN OBSTETRICAL SOCIETY. The following gentlemen have been made honorary members of the Berlin Obstetrical Society: Dr. Murphy, Dr. Eastlake, Dr. Greenhalgh, of London; and Dr. Leishman of Glasgow.

PROFESSIONAL PENURY IN FRANCE. A French editor laments over the sad condition, "the penury of a large number of medical men in France," indicated by the subscriptions of two, three, and five *francs*, which have been made towards the fund for raising a statue to Laennec.

PRESERVATION OF MEAT. The French government has tried Dr. Morgan's method of preserving entire sheep and oxen, and the results of the experiments have been highly satisfactory. The animals killed and injected last August have been eaten recently, and the meat was found to be excellent—especially the beef-steaks.

INCREASED VALUE OF LIFE IN FRANCE. In 1806-9 the average duration of life was—in males, 30 years 6 months; in females, 32 years, 7 months; mean, 31 years, 6 months. Now, in 1865, it is calculated that males on the average live 33 years, 4 months; and females 36 years, 4 months; mean, 34 years, 10 months.

MADAME PAILLOUX, a benevolent lady, has left a good country house and 1000 *francs* a year for a doctor to attend gratuitously the poor of the commune in which she lived, either at their own houses or at an asylum, which she has also endowed for aged and necessitous agriculturalists.

TESTIMONIALS. His friends have given to Mr. R. Garner of Stoke-upon-Trent a substantial proof of their esteem in the shape of a horse and brougham of the value of about £180. Mr. Garner has for many years been one of the surgeons of the North Staffordshire Hospital.—Dr. Hamilton of Falkirk has been presented with a silver *épergne* by the Falkirk School of Arts.

UNIVERSITY OF LONDON. On Friday, March 10th, Mr. G. Duff asked the First Commissioner of Works whether he had under his consideration a letter from the Senate of the University of London, on the subject of a building for the University. Mr. Cowper had received a communication from the Senate of the University, stating in detail the accommodation they considered necessary for the proper transaction of the business of the University. It was still under the consideration of the government.

ROYAL COLLEGE OF SURGEONS OF ENGLAND. At the meeting of the Council on March 9th, Mr. F. C. Skey, late president of the college, and Mr. S. Cartwright, were elected members of the Dental Board, the term of office of Messrs. Lawrence and Rogers having expired.—At the same meeting Mr. Edward J. A. Trimmer, M.A.Cantab., was elected Secretary of the College, in the vacancy occasioned by the decease of Mr. Edmund Belfour.

SCHOLARSHIPS AT CAMBRIDGE. An examination for four minor scholarships will be held in Downing College, on Monday, May 22nd, and two following days. The examination will be chiefly in classics and elementary mathematics, but some weight will be given to proficiency in French and German. Two additional papers will be set; one on Moral Philosophy, in connection with the principles of Jurisprudence, and on the Elements of International Law; the other, on the Natural Sciences, in connection with Medicine, namely, Chemistry, including analysis, Mineralogy, Botany, Comparative Anatomy, and Physiology; and, in awarding two of these scholarships, considerable importance will be attached to any special proficiency in the legal or in the medical subject. Persons who have not been entered at any college in the University, or who have not resided one entire term in any such college, are eligible to these minor scholarships, which will be of the value of £40 per annum, and tenable for two years, or until

their holders are elected to Foundation Scholarships. No one elected minor scholar will receive any emoluments until he has commenced residence as a student of the college. Satisfactory testimonials as to their moral character must be sent to the Master by all candidates for these minor scholarships, on or before Wednesday, May 17th. Further information will, if required be given by the Tutors of the college.

HOMICIDE BY IMPRUDENCE. That is a verdict which brought a fine of fifty *francs* and eight days imprisonment upon Madame Roy, who deals in drugs and groceries, and in the course of her business sold fifty *grammes* of nitre in mistake for *seidlitz* powder, and so caused the death of Madame Helie. It is a curious feature in the French law that a grocer may sell drugs, but not in medicinal doses; a regulation which seems to afford no protection for life. (*Chem. News.*)

UNION MEDICAL OFFICERS IN IRELAND. On Friday, March 10th, Mr. M'Evoe moved that her Majesty's Government should now adopt the recommendations of the Select Committee of 1858, to take into consideration the claims of Ireland to a grant of the half-cost of medical officers in unions, as is now the practice in England and Scotland. The Chancellor of the Exchequer opposed the resolution, observing that the recommendations of the Committee of 1858 did not show sufficient reasons for adopting it; that it was not for the interest of Ireland to urge the principle of equality in local taxation; and that the general question of relative taxation had been recently referred to a committee of the House. The resolution was negatived by 37 to 34.

REMOVAL OF LUNATICS FROM ENGLAND. In the House of Commons on Tuesday, Sir G. Grey said the law appeared to be that it was illegal to remove by force a lunatic who was a subject of this country, inasmuch as he or she was thereby deprived of the protection of the laws of England. Mary Ryan had been illegally removed, and the government were prepared to have requested that she should be sent back to this country; but it was considered that it would be injudicious to have her brought back to this country. The letter which he had himself written stated that the act was illegal and liable to prosecution; but, under all the circumstances, it was not thought expedient—and such were almost the terms of the law officers' opinion—that legal proceedings should be taken.

INFECTIOUS PATIENTS IN WORKHOUSES. On Tuesday, in the House of Commons, Colonel North asked whether by Article 115 of the General Consolidated Order of the Poor-Law Board, dated July 24th, 1847, any pauper suffering from small-pox or other infectious disorders could insist upon leaving the workhouse, in opposition to the opinion of the doctor, upon giving to the master, or, during his absence or inability to act, to the matron, a reasonable notice of his or her wish to do so. Lord Enfield said that neither master, matron, nor medical officer had power to detain any person in the workhouse against his will. All that they could do was to warn the persons who wished to leave, and who were in the condition referred to, of the extreme danger of the course, and that they were liable to be indicted for a misdemeanour.

ROYAL VISITS TO HOSPITALS. On Tuesday morning her Majesty surprised the inmates of the Consumption Hospital, Brompton, by a visit. The Queen, attended by the Duchess of Roxburghe, Lord Alfred Paget, Colonel the Hon. Arthur Hardinge, and Dr. Jenner, arrived at the hospital at eleven o'clock, and was received by the Hon. A. Kinnaird, Mr. P. Rose, Dr. Roe and Dr. Cotton, etc. Her Majesty walked through the four "galleries," called respectively the

"Victoria," the "Albert," the "Foulis," and the "Jenny Lind," entering many of the wards, speaking to several of the patients who were confined to their beds; and bestowing upon all kindly smiles and sympathising looks. Her Majesty then visited the chapel, and inspected the library; after which she expressed a wish to see the kitchens, with which, as well as with the larder and the steam apparatus for cooking and for raising the lifts for the patients and the provisions, the Queen appeared much interested. Her Majesty wrote her name in the visitors' book, and examined the vellum scroll containing the signatures of the late Prince Consort and of the distinguished visitors who were present at the laying of the foundation stone of the new building by His Royal Highness on June 11th, 1844. During her somewhat lengthened visit the Queen narrowly inspected all the arrangements, and by her numerous questions manifested much interest in the charity, which has long been honoured by royal support and patronage. To the patients, of whom there are 210, the royal visit was an occasion of intense gratification. Amongst those honoured by special notice was one of the survivors of the famous Balaklava cavalry charge. This poor soldier is an inmate of the hospital for the third time since his discharge from the army, having on each occasion been sufficiently restored to health to earn his livelihood.—On Wednesday her Majesty visited the General Lying-in Hospital, Lambeth. The Queen was received by Sir Charles Locock, Dr. C. Hutton, Dr. J. Clarke, and some of the officers of the hospital. Her Majesty, accompanied by the physicians, passed through the various wards, and evinced great interest in the health and welfare of the patients. Her Majesty afterwards wrote her name in the visitors' book, and on leaving the hospital expressed herself greatly pleased with all that came under her notice.

ODONTOLOGICAL SOCIETY. The monthly meeting of this society was held on the 6th instant, Thomas Rogers, Esq., president, in the chair. A letter was read from Dr. Weber of Paris, accompanying some specimens of vulcanite and enamel, which were distributed among the members. Mr. Spence Bate produced two specimens, teeth, found in a Roman cemetery during the excavations at Plymouth; the one showing, he said, that the ancients, two thousand years ago, were liable to suffer from toothache caused by decay; the other showing that in the development of teeth at that time the same laws seemed to hold good as were occasionally found now—namely, that the premolar was retained after the other teeth were developed. He regarded them as objects of antiquarian interest rather than physiological. Mr. Ramsay brought the patient he had introduced at the previous meeting, in order that the Society might judge of the progress of the case—one of cleft palate. He said the boy had practically worn the instrument only since February the 15th; but, notwithstanding his short practice, he had much improved in his articulation. The boy read a few lines; and the President and others expressed their satisfaction at his progress. After a short discussion, Mr. Ramsay promised to read a paper explaining his mode of treatment at the Society's meeting in May. The discussion of the papers read at the last meeting followed, in which Messrs. Cattlin, Tomes, Hulme, Vasey, Bate, Rymer, and Mummery took part. Mr. Bate mentioned a question put to him by Dr. Darwin; whether any dentist had ever met with a third deciduous molar, and if so, whether such a case was ever known to be hereditary. The President said he had seen three bicuspidis on one side of the lower jaw; but he had no knowledge of the previous

history. The thanks of the Society were accorded to the authors of the papers; and the meeting adjourned.

OPERATION DAYS AT THE HOSPITALS.

MONDAY.....Metropolitan Free, 2 P.M.—St. Mark's for Fistula and other Diseases of the Rectum, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.
TUESDAY....Guy's, 1½ P.M.—Westminster, 2 P.M.—Royal London Ophthalmic, 11 A.M.
WEDNESDAY...St. Mary's, 1 P.M.—Middlesex, 1 P.M.—University College, 2 P.M.—London, 2 P.M.—Royal London Ophthalmic, 11 A.M.—St. Bartholomew's, 1.30 P.M.
THURSDAY.....St. George's, 1 P.M.—Central London Ophthalmic, 1 P.M.—Great Northern, 2 P.M.—London Surgical Home, 2 P.M.—Royal Orthopaedic, 2 P.M.—Royal London Ophthalmic, 11 A.M.
FRIDAY.....Westminster Ophthalmic, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.
SATURDAY.....St. Thomas's, 1 P.M.—St. Bartholomew's, 1.30 P.M.—King's College, 1.30 P.M.—Charing Cross, 2 P.M.—Lock, Clinical Demonstration and Operations, 1 P.M.—Royal Free, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.

MEETINGS OF SOCIETIES DURING THE NEXT WEEK.

MONDAY. Royal College of Surgeons of England, 4 P.M. Professor Huxley, "On the Structure and Classification of the Mammalia."—Medical Society of London, 8 P.M. Mr. R. Barwell, "On the Prevalent Mismanagement of Common Forms of Joint-Diseases." Dr. Brunton, "On the Treatment of Tape-worm by Male-Fern and Kamala."
TUESDAY. Pathological Society of London, 8 P.M.—Ethnological.—Statistical.
WEDNESDAY. Royal College of Physicians, 5 P.M. Dr. Peacock, Croonian Lectures. "On some of the Causes and Effects of Cardiac Disease."—Royal College of Surgeons of England, 4 P.M. Professor Huxley, "On the Structure and Classification of the Mammalia."—Geological.
THURSDAY. Royal Society.
FRIDAY. Royal College of Physicians, 5 P.M. Dr. Handfield Jones, Lumleian Lectures. "On some Points in the Pathology of Nervous Disease."—Royal College of Surgeons of England, 4 P.M. Professor Huxley, "On the Structure and Classification of the Mammalia."—Royal Irish.

TO CORRESPONDENTS.

*. All letters and communications for the JOURNAL, to be addressed to the EDITOR, 37, Great Queen St., Lincoln's Inn Fields, W.C.

COMMUNICATIONS.—To prevent a not uncommon misconception, we beg to inform our correspondents that, as a rule, all communications which are not returned to their authors, are retained for publication.

CORRESPONDENTS, who wish notice to be taken of their communications, should authenticate them with their names—of course, not necessarily for publication.

We do not consider that paragraphs, unauthenticated or authenticated, in newspapers, reflecting on the conduct of any of our medical brethren, or on matters professional, require notice in our pages. The profession itself is the only proper court of appeal in such matters. The publication of medical disagreements in the daily prints is very much what Voltaire called washing dirty linen in public. The public cannot be, and never are, correct judges of professional matters. To appeal to them, therefore, is to appeal to incapable and very bad judges—to excite, perchance, a scandal, without a chance of procuring a fair judgment. We have faith in the opinion of our professional brethren—a firm belief that they not only know how to do, but that they always will do, justice; and therefore consider it not only superfluous, but sadly out of place, to make appeals to popular sympathies through the daily press on professional subjects. The Profession has always set its face against such proceedings. The abuses which may arise therefrom are evidently very great. If such appeals were accepted as legitimate, then this would happen: That a man might unjustly injure his professional brother in public estimation; and at the same time loudly blow his own professional trumpet. Against such things we, therefore, enter protest. If a medical man is aggrieved, let him be contented to appeal to his own brethren.

THE ARMY MEDICAL SERVICE PASS-LIST.—Mr. C. Spurway informs us that the statement in the list of successful candidates at the Netley examination, that he was educated at Cork, is an error; and that he was educated in London and Paris. The list which we gave last week was printed accurately from one sent to the office of the JOURNAL by the Director-General. It is plain, however, from Mr. Spurway's statement, that the list contained an error in regard to him. Our readers will see that a slight modification of the figures is therefore required in the remarks which we made on the list.

WE have received the following note from Professor Boeck.

[TRANSLATION.]

SIR.—It is stated in No. 213 of the BRITISH MEDICAL JOURNAL, that I have not had a case of relapse since commencing to inoculate with the matter of indurated chancre. This, however, is a misconception; and I understand very well how the mistake has occurred. I will send you a reply to Mr. Lee, and will remove the misconception above mentioned. You will receive my reply in a few days, and I hope that you will be good enough to insert it in your JOURNAL.

I cannot write your language; and hence it is not so easy for me to reply.

Accept, sir and much-honoured *confrère*, the assurance of my high regard
W. BOECK.

Christiania, March 2nd, 1865.

THE BOWEN FUND.—SIR: I much regret to find that, through inadvertence, I omitted to express my gratitude for the signal service you rendered my cause in the late action which was brought against me. I am, indeed, most grateful for the powerful advocacy and influential assistance you afforded me at the trying time when I so much stood in need of them.

The sympathy shown me by the profession and the medical press in this matter, has been so general, that my regret has been, and will be, that, in return, I am only able to express how truly sensible I am of the obligation under which I have been placed.

I am, etc.,

E. BOWER, M.D.

Birkenhead, March 11th, 1865.

THE GRIFFIN TESTIMONIAL FUND.—SIR: The following subscriptions have been further received on behalf of the above Fund:—Dr. Jno. Ewens (Blandford), 5s.; Dr. Barker (Bedford), 5s.; N. Godfrey, Esq. (Turvey), per Dr. Barker, 5s.; Dr. Spriggs (Great Barford), per Dr. Barker, 5s.; J. F. Williams, Esq. (Craufield), per Dr. Barker, 5s.

Amount previously announced, £117:11:0. Received at the *Tanet* office, £7:17:6.

I am, etc.,

ROBERT FOWLER, M.D.,

Treasurer and Hon. Sec.

145, Bishopsgate Street Without, March 15th, 1865.

BOOKS RECEIVED.

COMMUNICATIONS have been received from:—Dr. THOMAS RADFORD; Dr. DURRANT; Mr. J. H. WOLSTENHOLME; Dr. HENRY SIMPSON; Dr. W. H. O. SANKEY; Mr. T. M. STONE; Mr. J. VOSE SOLOMON; Mr. HARRISON; THE HONORARY SECRETARY OF THE WESTERN MEDICAL AND SURGICAL SOCIETY; Dr. KELLY; THE SECRETARY OF THE ODONTOLOGICAL SOCIETY; Mr. RICHARD GRIFFIN; Mr. C. SPURWAY; Mr. HULKE; Dr. BOWEN; PROFESSOR BOECK; Dr. J. HEGGATE; Dr. J. D. SCURRAH; Dr. FREDERICK J. BROWN; Dr. G. H. PHILIPSON; Dr. MARSHALL; Mr. JONATHAN HUTCHINSON; Mr. J. Z. LAURENCE; Dr. P. W. LATHAM; THE REGISTRAR OF THE MEDICAL SOCIETY OF LONDON; Dr. JOHN BARCLAY; Dr. C. L. ROBERTSON; Mr. H. E. NORRIS; THE SECRETARY OF THE HARVEIAN SOCIETY; Mr. A. B. STEELE; and Dr. ROBERT FOWLER.

ADVERTISEMENTS.

ESTABLISHED 1843.

Mr. J. Baxter Langley, M.R.C.S.
Eng (late of King's College, London), PROFESSIONAL AGENCY, 50, Lincoln's Inn Fields, W.C.

Competent Assistants provided
without delay, free of expense to the Principals. No gentlemen recommended whose antecedents have not been inquired into. Apply to Mr. Langley, 50, Lincoln's Inn-fields, W.C.

To Principals.—Serious loss and
inconvenience having been suffered by principals in consequence of introduction to their connexions of drunken and dishonest Assistants, Mr. Langley proposes, with the co-operation of the members of the Profession, to keep a Register of the names and moral qualifications of such parties; so that whilst on the one hand the practitioner who may make a report may be protected from annoyance, such parties may be prevented from imposing (by suppression of references or otherwise) upon other professional men in the future.—All communications will be regarded in strict confidence.—Address, Mr. Langley, Professional Agency, as above.

Locum Tenens can be despatched
by an early train, after receipt of letter or telegram, stating terms, duties, and qualifications required.—Fee, 10s. 6d. Address, Mr. Langley, as above.

In a fashionable Watering-place,
a good Family Practice, with appointments (£210), for transfer. Private practice upwards of £100 a year. The successor should be an active married man, of good address. The advertiser having the opportunity of taking a public appointment, will make liberal terms with an immediate purchaser. Address, "S., 1,123," Mr. Langley, as above.

At the Sea-side, in a lovely spot,
a small unopposed Practice for transfer. Income £200. Easily and inexpensively worked. House rent £25, free of all taxes. Good society and lovely scenery. Address, "S., 1,125," Mr. Langley, as above.

Medical Assistants.—Wanted
Immediately, several competent In-door and Out-door ASSISTANTS, qualified and unqualified, for Town and Country. No charge for registration, but references in all cases required. Apply to Mr. Langley, 50, Lincoln's Inn-fields, W.C.

M. MASTERS,

210, NEW KENT-ROAD, LONDON, S.E.,

PATENTEE AND MANUFACTURER OF

ARTIFICIAL HANDS AND LEGS.

M. MASTERS begs respectfully to inform the Nobility, Gentry, and the Medical Profession especially, that he is (and has been for many years) a manufacturer of the original "Pott's Leg," sometimes called the "Anglesey Leg." For improvements and superiority of manufacture he was awarded a

PRIZE MEDAL AT THE INTERNATIONAL EXHIBITION, 1862.

EXTRACT FROM REPORT BY FRANCIS SEYMOUR HADEN, ESQ., F.R.C.S. (ONE OF THE JURORS):—
"Mr. Masters' Artificial Limbs deserve special commendation of the Jury. All the Artificial Limbs by this maker leave nothing to be desired. Whether Lightness, Form, or Solidity, is regarded, Mr. Masters' Artificial Limbs are prominent examples of the improvements effected within the last few years in this branch of scientific industry."

Observations

ON THE

CÆSAREAN SECTION AND ON OTHER OBSTETRIC OPERATIONS.

BY

THOMAS RADFORD, M.D.,

F.R.C.P. EDIN. AND F.R.C.S. ENG., ETC.,

HONORARY CONSULTING PHYSICIAN TO ST. MARY'S HOSPITAL,
MANCHESTER.

CHAPTER V.

Other Obstetric Operations.

THE other obstetric operations which require to be now considered are reduced into two classes, one of which includes those measures which are to be adopted compatibly with the preservation of the lives of both the mother and the infant. This division embraces the Employment of the Long Forceps, Turning, and the Induction of Premature Labour. The other class of obstetric operations are those by which the life of the infant, or that of the embryo, as the case may respectively be, must be sacrificed; namely, Craniotomy, Embryotomy, and the Induction of Abortion.

I shall make a few remarks on a suggested plan for Dilating the Distorted Pelvis; and I shall also briefly mention Symphyseotomy.

The objects to be attained by these two classes of operations are very differently estimated by different obstetricians. Some consider that those measures by which the lives of both mother and child are preserved, are adopted solely for the purpose of lessening the too frequent employment of craniotomy; others consider them as applicable to prevent the performance of the Cæsarean section. But few practitioners would ever think of having recourse to this latter named operation in cases in which either the long forceps, turning, or the induction of premature labour, could be successfully employed. The latter class of operations are performed with the express object and intention, as far as possible, to supersede the Cæsarean section.

CHAPTER VI.

Operations intended to save the Life of the Mother, and also that of the Infant.

I.—*On the Employment of the Long Forceps.* This instrument most justly takes a high position in obstetrics, because its sole employment is for the preservation of life. It is intended, within a certain range of protracted labour, to supersede craniotomy. In the hands of a discreet and judicious practitioner, it is both a safe and a very powerful instrument. Before its introduction into practice, whenever turning could not be performed, the child was doomed to destruction by craniotomy. The employment of the long forceps in this country has been very tardily recognised. When I commenced (1817) my professional career, this instrument had never been used in Manchester; but, having heard the valuable remarks of Dr. Haighton upon its use, I availed myself of the first opportunity of making trial of it. I employed his instrument; but, after repeated trials, I abandoned it, and contrived one of my own, with blades of equal length, but with parallel shanks. This in-

strument I also found tended, in its embrace and compression of the infant's head, to produce disagreeable effects upon it, which I endeavoured by a second contrivance to obviate. This instrument is so constructed that only a limited degree of compression can be exercised. It has very short handles, and consists of blades of an unequal length: one, the long one, to lie over the face; the other, the short one, to be placed over the occiput. By this arrangement, the head of the infant is placed in the most favourable position within their grasp, and none of the injuries are inflicted upon it which are found when forceps with equal blades and long compressing handles are used. This instrument is employed mainly as a tractor, and very limitedly as a compressor.

To save the life of the child by the use of the long forceps is, doubtless, the object of every obstetrician; for, unless this were his intention, it would be better at once to have recourse to craniotomy. The head of the child cannot bear more than a certain degree of pressure compatible with its life; and, although it is wisely ordained that it can safely bear a greater degree of pressure before than after birth, yet there is a limit even here, beyond which it cannot be carried without the destruction of the infant's life. The head can also bear a greater degree of pressure when the force is applied in one direction, than it can in another. Much greater compressing force can be more safely used when exercised in the bi-parietal, than when applied in the occipito-frontal diameter. As the long forceps are usually placed on the head of the infant so as to embrace it in its long diameter, we ought therefore to consider whether our instrument is so constructed as to permit such an undue degree of pressure as may prove unfavourable to the life of the infant.

The head of the infant, when it is situated at the brim of the pelvis, usually lies with its fronto-occipital diameter corresponding to one of the oblique diameters of the pelvis; the vertex or face being placed towards the right or towards the left acetabulum. But when the antero-posterior diameter of the pelvis is shortened by the sacrum projecting more forwards, the head assumes a more directly transverse position. Now, in this position of the head, it is most desirable to place the two blades of the forceps on the sides of the pelvis, so that one blade lies over the face, and the other over the occiput of the infant. In this case, the instrument embraces the head in the most unfavourable direction for its safety, if forcible compression be made. But the lateral pelvic position of the blades of this instrument is much safer for the maternal pelvic organs than if, as recommended by some practitioners, they were placed in the conjugate diameter. To add the bulk of the instrument to the already diminished capacity of this part of the pelvis would be unwise. In all our artificial appliances, we ought to endeavour to produce similar changes on the head of the infant, which nature accomplishes, if left unaided. The head is lengthened, and its rounded shape changed; whilst its bi-parietal diameter is lessened. The former change we ought to obtain by having the instrument so formed as to allow the head to elongate when traction is used, and by the pressure it receives from the anterior and posterior parts of the pelvis. Notwithstanding the high opinions expressed of the great advantages of compression, I am convinced it is mis-

chievous. This statement is not theoretical, but rests on facts derived from the use of the long forceps both as a strong compressor, and, as now recommended, a tractor with very slight compressing power. In truth, I cannot understand how effective compression can be made, unless the blades of the forceps are applied on the sides of the head, and on the anterior and posterior parts of the pelvis. The tractive power of my instrument is increased by having a handkerchief passed through an opening in the shanks, which is formed by nearly a semicircular curve in each shank near the handles. The handles should be only slightly tied, to maintain their position. A pendulum, or side-to-side movement, must be combined with the traction; taking care that the range is regulated by the line of the axis of the pelvis, and that no pressure be thrown upon the maternal pelvic structures.

This instrument is sometimes required to rectify the position of the head of the infant, when its long diameter lies parallel with the antero-posterior diameter of the pelvis: the face lying either towards the pubes or towards the sacrum. In such cases, the blades of the forceps should be introduced along the sides of the pelvis, but should be placed over the parietal bones of the head. (For a further exposition upon these questions, I refer my reader to essays on various subjects connected with midwifery.)

There are no statistics published which afford any truthful information either as to the frequency of the application of this instrument, or as to the mortality of those women who have been delivered by it. In my own practice, I have used this instrument very frequently; and I can most conscientiously assert that I never had a death as a result of its application. In cases in which craniotomy had been performed, in some once, in others several times, under the management of different practitioners, I have delivered the women by this instrument, and saved the children. It is the duty of the obstetrician to keep constantly before his mind the dangers of protraction, and recollect that these increase in a ratio (already stated) proportioned to the length of time the labour is prolonged.

If this instrument is to fully accomplish its capabilities of saving life, it must be used before those dreadful mischiefs are produced by delay. If we calculate to bring a head through a fixed pelvic space, we ought to remember that this space is considerably lessened by the effects of long continued pressure.

The dogmatic injunctions of present and former authors, that the forceps ought not to be used before the os uteri is fully dilated, or until the woman has been in labour a certain number of hours, or until the ear of the child can be felt, are highly dangerous. They are delusive, and would, if acted upon, altogether prevent the use of the long forceps.

If these alleged conditions are required to exist to guide the practitioner when he ought to have recourse to this instrument, these rules are tantamount to a complete interdiction of its use. In fact, they are too absurd, unfounded, and dangerous, as indications of the propriety of even using the short forceps.

To wait for the dilatation of the os uteri after the rupture of the membranes is a great mistake; for, in the great majority of cases which require aid by the long forceps, this organic change cannot take place.

The obstacle being at the brim of the pelvis, the head of the infant cannot be pressed down upon it; so that, before this change happens, irretrievable mischief may be inflicted by the continued pressure which the pelvic tissues must, under such circumstances, endure. Therefore, as soon as the time has arrived for delivery, we must not hesitate to apply the long forceps, provided the os uteri is so far dilated, and further dilatable, to enable the practitioner safely to introduce the blades.

If the instrument is in the hands of a discreet and judicious obstetrician, no mischief need be dreaded; for the blades of a well-made instrument will rest as safely within the uterus as the hand of the practitioner.

Time ought never to be considered an element of calculation, especially during the second stage of labour, for the use of instruments, except in creating an anxiety to be on the watch, and to take timely steps to deliver the patient.

An early use of the long forceps, when the necessity of the case is established, will prevent those serious constitutional and local mischiefs (already mentioned) which are produced by the long continued pressure of the head of the infant upon the pelvic organs and tissues. Those who are opposed to the use of instruments, and advocate time and patience, attribute to their application those structural and organic lesions which are really the effects of delay.

It has been already stated, that the head of the infant can only safely bear a certain amount of compression by the forceps; but it must also be understood, that the infant is frequently destroyed by injury inflicted upon the head during protracted labour. Procrastination beyond a certain limit is highly hazardous to its life; and, as its preservation is an important object to attain, the long forceps should be immediately applied (if safe to the mother), if the stethoscope indicates danger.

In convulsions occurring during labour, these instruments may be of essential benefit, if they can be safely used.

In cases of accidental, and also in some cases of partial, attachment of the placenta over the os uteri, this instrument has great advantages over other means, if the os uteri is dilated and dilatable, when the vital powers are very considerably depressed.

In some cases of rupture of the uterus, in which the child does not recede, and if there is sufficient pelvic space, and if all other requisite changes exist for their safe introduction, then there may be a remote chance of saving the infant's life by their use.

In cases of arrest from exhaustion, and even in fatal syncope, this instrument may be usefully employed. In some cases of face-presentations, and other unfavourable positions of the head, the application of the long forceps will be found most advantageous. The want of relative proportion between the infant's head, being abnormally large, or too firmly ossified to allow a necessary diminution in its size, in order to pass into and through the pelvis, are causes of protracted labour; and, when the obstacles are so great as to oppose the head passing through the brim of the pelvis, the long forceps will be required to effect the delivery. When the pelvis is relatively too small in its general conformation, from premature defect of development, or when it partakes too much of the male conformation, or in the

slight oblique-shaped pelvis of Nægele, or when the pelvic bones have been fractured and there has been irregular union (I have a cast of a pelvis which had been fractured, and which in character now resembles the oblique of Nægele), or when small sized exostoses or loose or fixed tumours occupy the pelvis, the long forceps may be requisite and effectual in the delivery; but, in all these cases, the practice must be determined by the available space which exists in each case.

Those cases in which the value and powers of this instrument are most conspicuous are those in which the brim of the pelvis is diminished in its antero-posterior diameter, either by rickets or by mollities ossium.

In the slighter pelvic deformities produced by rickets, the brim is often considerably lessened in its conjugate diameter, whilst the cavity and outlet are not very much altered either in size or in shape; so that the obstacle to the descent of the head is chiefly confined to the brim. But, in a pelvis distorted by mollities ossium, the diminution in its capacity is not confined to any one portion, but the brim, cavity, and outlet suffer in a greater or less degree; so that, when delivery by the long forceps is contemplated, the character of the distortion must be well considered.

It must be obvious to every well informed obstetrician, that the head of the infant can be more easily brought through a pelvis distorted by rickets, than through one distorted by mollities ossium; assuming that the antero-posterior measurements are the same in both. Opinions as to the space required to bring the head through the pelvis by the long forceps differ very considerably; and, on reflection, this variation is not to be wondered at. It is at all times difficult to arrive at an arithmetical accuracy by a vaginal examination of the different character of distortion just alluded to. The difference in the size of heads of infants, and likewise the different degrees of ossification, must all tend to influence the result. But, notwithstanding these uncertainties, it is desirable that I should state my opinion as to the smallest space at the brim of the pelvis through which the obstetrician would be warranted in attempting to extract the infant by means of the long forceps. Knowing as I do the great responsibility I incur in making positive assertions on practical points of such importance, yet, as I have by trial proved the truth of my statement, I hope I shall not be charged with temerity. I have the more confidence in giving my opinion on this point, because it is certain that, if this instrument cannot be successfully used, the life of the infant would have to be sacrificed. I would, therefore, rather run the risk of committing a venial error by leaning to the side of mercy, by recommending, in the first place, a cautious trial of the long forceps where there was the least doubt in the mind of the practitioner as to the precise pelvic measurement, and thereby give the benefit of the doubt to the unborn babe. With this feeling, I then say that, where the distance from sacrum to pubes is three inches, and a fraction under, and there exists sufficient space in the transverse diameter, an experienced practitioner ought to make a cautious and persevering trial of the long forceps before he has recourse to craniotomy. This opinion is advisedly given, because it is quite impossible to compute either the positive and relative space of the pelvis, or the size, compressibi-

lity, or other conditions of the head of the infant, with such mathematical certainty as to warrant any person to destroy life.

II.—*On Turning in Cases of Slight Distortion of the Pelvis.* Turning, in cases of slight distortion of the pelvis, justly ranks as a conservative operation. Turning was formerly had recourse to in all difficult labours in which craniotomy was not performed, because the use of the forceps was not known at that time; but, after Chamberleyn's discovery, this practice gradually sank in the estimation of obstetricians.

The thanks of the profession are due to Professor Simpson for the revival of this operation, and for the clear and lucid manner in which he has enforced his opinions both by argument and statistical data. He advocates turning in cases of slight distortion of the pelvis, and considers that the base of the head of an infant will pass with more facility and through a smaller aperture, when brought first, as in footling cases, than when it passes last, as in ordinary head-presentations. This doctrine, however, I ventured to differ from (see *Provincial Medical and Surgical Journal*, vol. ii, p. 3); and it has been more recently doubted by Dr. McClintock (*Obstetrical Transactions*, vol. iv, p. 175). At that time, I considered perforation, if required after turning had been performed, would be more difficult and more hazardous. This opinion has been also lately expressed by Dr. McClintock.

Notwithstanding my former opinion, above referred to, and the opinion I now hold, that turning in cases of protracted labour, from the slighter contractions at the brim of the pelvis, cannot ever become an alternative operation for the use of the long forceps. There are, doubtless some cases in which turning would deserve a preference; and, in the hands of some practitioners, it might be more safely undertaken.

The merit of the professor, in trying to establish this as an alternative operation, is in the intention to abolish, as far as possible, craniotomy.

"This practice of turning, in cases of pelvic deformity, is one of the agitated questions of the present day, which requires the sober and dispassionate consideration of all who are interested in the establishment and advance of obstetrics."

This question can only be settled by a long accumulation of practical facts and comparative trials. Mere opinion can make no approach towards its settlement.

The danger of turning will be considerably diminished when the plan of internal and external version, as recommended by Dr. Hicks, is adopted. (*Vide Obstet. Trans.*, vol. v, p. 219; also his essay.)

In the performance of turning, I prefer and recommend the operator to seize one foot or one knee, for reasons set forth in my essays on various midwifery subjects. The funis is thereby better defended, and the egress of the head is rendered safer and easier by a partial breech-case having preceded it.

Dr. McClintock, "after having seized one leg and brought it into the vagina, could not, with all the force he could use, make the child revolve." He quotes the opinion of Madame La Chapelle, who speaks of the difficulty of effecting version by one leg when the head presents. She says the difficulty is produced by the head being pushed into the brim

before the breech. It is quite evident that the cause which opposed the revolution of the child was, not taking hold and bringing down one leg, but the result of protracted labour after the rupture of the membranes. The head was forcibly pushed down upon or partially into the pelvis; and the uterus was doubtless violently, and perhaps spasmodically, contracted upon the infant's body, moulding and applying itself to all its hollows and projections.

As turning, in the cases of slighter distortion of the pelvis, is intended to save the child, this operation ought to be early performed—before, or as soon as possible after, the discharge of the liquor amnii. In cases which have been unduly procrastinated after this event has happened, and when the uterus is strongly embracing the infant, violent attempts to turn ought not to be made until some plan has been adopted to lessen the irritability of the uterus, and relax as far as possible its tonic and alternate contraction. Venesection and opiates are appropriate remedies. Does chloroform relax the uterus?

The death of the infant after the operation of turning (if it be living when this operation is commenced) is most frequently caused by the practitioner hurrying too rapidly its delivery after the revolution has been made. Time should be first given for the uterus to adjust itself to the changed position of the infant. When extractive force is used, it should at first be slow and gentle, and, if possible, in cooperation with uterine contraction. If the infant be rapidly and forcibly dragged through the pelvis, the chin leaves the breast, and is tilted upwards, thereby creating an unfavourable relative position between the diameters of the head and those of the pelvis. A great difficulty is now found to exist, which opposes an easy entrance of the head into the brim. Another mischief happens from attempts to draw the infant too quickly along by bringing the too bulky part of the infant (the head) to press upon and distend the os and cervix uteri before these parts are prepared to bear the change; and, consequently, spasmodic retention takes place, which is often so violent and obstinate as to cause the death of the infant.

[To be continued.]

A SENSIBLE REMARK. Mr. Shillcock at the Pharmaceutical Society exhibited a "Poison Bottle." A short discussion on poison bottles in general followed, in the course of which Mr. Morson sagaciously remarked that the best of them was but a clumsy substitute for the care and intelligence which should always be exercised when dealing with such important matters as remedies and poisons.

FAILURE OF THE METROPOLITAN GAS REGULATION ACT. The first prosecution instituted under this Act has failed. The prosecution was instituted by the City Sewers Commission. The lighting of our streets and houses in some districts of London is at present disgraceful. The Gas Regulation Act was a great legislative mistake; but its complete failure in improving or even maintaining the quality of the gas supplied by the companies must be ascribed to causes into which we dare not particularly enter. But we have no hesitation in saying that district medical officers of health, sometimes in large practice, can hardly have time to devote to the duties of a gas inspectorship, even if they had the knowledge to qualify them for the post. (*Chemical News.*)

ILLUSTRATIONS OF THE DIFFERENT FORMS OF INSANITY.

By W. H. O. SANKEY, M.D. Lond., Proprietor of Sandywell Park Private Asylum; Lecturer on Mental Disease in University College, London; late Medical Superintendent of the Female Department, Hanwell Asylum.

[Continued from page 220.]

IN the last paper was given a case of general paresis. The importance of the disease warrants a report of another case of the same; and this will be given in the words of the case-book, with omissions only for the sake of brevity.

A. M., married, aged 40, had had one child; she was a lace-cleaner. Her education had been plain. This was her first attack. She was admitted Sept. 12th, 1861. She was married twenty years previously, but never lived with her husband. She was in partnership with a female, and they lived together many years; and, about two years ago, the partner took to drinking, and ever since had been the cause of great trouble and annoyance to the patient.

About April 1861, A. M. shewed the first indications of insanity. One Saturday night, she bought three or four shillings' worth of "sweet-stuff", and scattered it and half-pence to the children in the street, and acted in a strange manner in several other ways. A short time after this, she became involved in a dispute with a cabman; after which event especially, her mental aberration became more marked. She began to squander money; talked of her wealth and her importance; and, within a week of the dispute with the cabman, she began to talk of erecting a chapel at her own cost, and made numerous extravagant purchases.

Her natural disposition, as described by her brother-in-law, was rather penurious; at all times economical and careful. She was quiet in her dress, and retiring in manner; was kind and cheerful; of rather warm temper; fond of the company of her own family; and she went often to the public amusements (her relations were employed at theatres).

No hereditary predisposition was known. Her habits had always been temperate; on this point, the informant spoke positively.

Her previous health had been good; but she had complained of headaches during the last twelve months. She was first sent to Camberwell House Private Asylum, and remained there five months; and was then transferred to Hanwell.

On admission. She was five feet in height; her figure square and well developed; her head was long, and slightly contracted across the forehead. Her hair and irides were grey; teeth regular and well developed. The bodily condition was pretty good. Articulation was indistinct and confused. In protruding the tongue, she made one or more ineffectual efforts before she succeeded. The gait was unsteady. In taking anything with her hand, she made several catches at the object before she could seize it. She was restless; not noisy; was cleanly in habits.

Sept. 12th. She said, she was twin-princess with Queen Victoria. On the 24th of next May, she was going to be crowned. She was the eldest daughter of the Virgin Mary, and was going next year to Jerusalem by telegraph to be crowned. She had been in the world hundreds of years.

Sept. 30th (eighteen days after admission). She said that she had been here four months, and had been mad ever since she came; and then was overcome and cried. She said she was queen; that "we were not going to have any women; she was a man; she was Jesus." There was an expression of slight excitement; and a slight difference in the pupils—the right being the larger. She had continued much in the same condition since admission; she had occasional outbreaks of crying of about an half an hour's duration. She continued to talk in a rambling discursive manner. Her ideas were elated.

Elation of ideas is the expression by which this peculiar form of delirium is usually described. The French call it an expansive delirium. The words used are usually expressive of size or immensity; they are not imaginative, but usually of puerile character; as, for example, the following, which were taken down from this patient's mouth, and delivered in somewhat drawing tone: "I'm married, I am. I've got six children. My husband is at Buckingham Palace. We are all dukes. I've all the isles in the world. A beautiful husband. He is very fond of me; and I am as happy as the day is long."

Her feelings also were very excitable; the least appeal to the sensibilities caused tears, and the least affront aroused her anger. The eyes had a heavy appearance; the eyelids were slightly drooping. She walked cautiously, and not very steadily, apparently by an effort of the attention; her gait was peculiar, straddling. Speech was drawing; but the tongue was protruded without difficulty. The tongue was clean; appetite good; bowels regular; pulse 96. She slept well.

From Oct. 3rd to Oct. 6th, the notes describe an occasional outbreak of noise, with restless and noisy nights, with the same condition of mind. She was ordered three glasses of wine daily.

1st Month after Admission. She said she was "first rate"; that her name was altered; that she had lots of money, and was the richest woman in the world; that she had bought all the theatres; that Mr. —, her brother-in-law, was so very happy and very handsome, etc. Her speech was mumbling; she could not pronounce "truly" or "rural". There was slight drawing down of the angles of the mouth; but no tremors were detected about the mouth. The right pupil was larger than the left.

2nd Month after Admission. Her mental state was about the same. There was a slight improvement in bodily health; but the appetite was reported to be indifferent, which is rare among paretics.

4th Month. She said she was "Princess Annie". Her voice was tremulous; the articulation mumbling and indistinct, with twitching of the muscles of the face. Pulse 108. She was looking better in general health. The tongue was clean and free from tremor; appetite indifferent. The pupils were unequal; the right to a slight extent larger than the left. She was disposed to undress or loosen her clothes.

5½ Months. She had been more restless, and slept ill. She was out of bed knocking at the door all one night, and calling out. She appeared a little depressed; but said she was "all right". The mind was more imbecile; she spoke in a simple and childish tone. She had not menstruated since admission.

7th Month after Admission; or 12th Month of Disease. She was restless, and constantly wandering up and down the gallery; was disposed to undress, and was regardless of decency. She walked with a great inclination to the left side, and this had been very gradually increasing of late; she occasionally fell. The speech was now very indistinct; she slurred the syllables and ran them together. In attempting to protrude the tongue, she had but little control over

it; it was jerked out and retracted several times, or held back for some time, before it was protruded in a way to exhibit its surface. The pupils were unequal; the left was smaller, and was also irregular in shape, somewhat flattened in the upper edge, and uneven in outline. Her appetite was now voracious. Her mental state was more feeble. She was unconscious of stools. She had lost flesh.

13th Month of Disease. She was gradually becoming more and more feeble, both in mind and body. She could not recollect the visit of her sister two days previously. She was up, and would not lie in bed; was very dirty. She stooped and bent much to the right side. Articulation was very indistinct; the voice tremulous; and the pupils irregular. The tongue was protruded with difficulty, and after several efforts. Her appetite was ravenous.

14th Month of Disease. The mind was imbecile. There was considerable twitching of the lips. The gait was very tottering and feeble. The right pupil was larger than the left. She was emaciating; but ate largely, and had four glasses of wine daily.

15th Month of Disease. During the past month, the notes show at first slight improvement, especially in mind; but this lasted but a few days. She took to the bed early in this period, or about the end of the first week. The knees then began to be drawn up, and, after a short time, could not be extended. She then was reported to be wholly unable to stand. She gathered up the bed-clothes into heaps. She became more and more demented; her voice was almost unintelligible from stammering and mumbling of the syllables. In attempting to speak, the words were drawled, and considerable twitching of the facial muscles took place. She took food well up to the last; but she was fed carefully with mince and wine. Death occurred in the fifteenth month of the disease.

It must be remarked, that there is great disposition to choke in paretics; but this is guarded against by the precautions adopted.

The above case will be seen to bear a general resemblance to that which preceded it. But all the phenomena of the disease are scarcely to be met with in two cases, however typical they may be. The following summary of the symptoms and history of General Paresis of the Insane may, therefore, be of interest.

General paresis is more common in men than in women; more frequent in cities than in country districts. It is common in certain countries, and is almost unknown in others. It is more common in the lower orders. It bears, therefore, a certain parallelism in the above particulars to syphilis. Sexual improprieties of some sort occurred in many of my cases. The question of the connexion of syphilis with general paresis is deserving of further investigation.

The disease has been divided by writers into three stages. These separations are of course perfectly arbitrary. The symptoms manifest a very gradual ingravescence; and they are connected chiefly with mental and motor phenomena.

The earliest symptom is usually some act of extraordinary character, occurring suddenly. The attack is often without well marked melancholic premonitory stage. A common act to show itself first is an unmeaning act of theft without any attempt at concealment; or some indecent act, stripping in females, or going about without proper clothing or indecent exposure of person in males; or some extravagant or foolish expenditure, as the purchase of large quantities of useless articles, lavish distribution of property, etc.

The mind is at first usually excited. The patient is talkative, is bragging, gay; occasionally the excitement is attended with great violence.

It is common for the mental excitement to subside after two or three months; at which period the motor symptoms are often scarcely perceptible. Hence, the patient is often supposed to be recovered. At this period, the paresis of the muscles usually commences; there is at first to be detected only a slight or occasional stutter in speaking, or a slight twitching of the upper lip, and a quivering on the surface of the tongue when it is protruded. In those cases in which the delirium has subsided, the mind gradually begins to manifest some feebleness; also, a slight simplicity in conversation, with some foolish bragging, especially of their health. However, the mental and motor symptoms increase together. But to continue the latter first.

The paresis extends to the limbs, affecting both sides equally, or nearly so. The patient, perhaps, complains of weakness of the knees, or places his hands on his thighs in going up stairs, or finds a difficulty in descending. There then occurs a gradual alteration in the gait. The expression of the gait, so to speak, is altered. The patient walks with evident attention and caution. The legs straddle; the head is carefully poised, sometimes as though there were on it something which the patient was anxious not to drop. The feet are raised only slightly, and quickly replaced on the ground again. There is a want of spring in the foot; and while standing the patient stands on both legs—seldom poises his body on one or other limb. There is occasionally some stumbling; there is no reeling, though there is some approach to the phenomena of drunkenness—in which also there is a paresis of the muscular power. The characters differ in the two states. There is no reckless motion in the disease. The speech, however, or rather the articulation, becomes like that of the drunkard. From the occasional stutter at first observed, the difficulty of executing the labials becomes pronounced. The patient stammers, splutters, slurs, and runs the syllables together; and, late in the disease, has a difficulty in commanding the movements of the tongue as well as of the lips. On being asked to protrude the organ, the patient opens the mouth, and retracts the tongue to the back of the mouth; then thrusts it out and in; and, late in the disease, on being asked to show it, will very commonly open the mouth, and take the hand, as it were, to assist in the protrusion. When the disease has reached this pass, it has entered the arbitrary division of the third stage. The pupils now begin to show inequality of dilatation and irregularity in shape, and differ from time to time in both respects; the power over the limbs becomes less and less; the hands are now clearly affected; the action of the fingers in manipulation is difficult. The patients fumble, as if chilled with cold; in this state, too, they are particularly fond of picking at small objects. The feebleness of limbs at length confines them to the bed. At first, the want of power is always more marked the first thing in the morning. After the patient becomes no longer able to stand from want of power, the difficulty is further increased by a commencing contraction of the limbs, especially of the inferior extremities. The patient then lies in bed, and has a peculiar propensity to huddle up the bed-clothes in heaps about his head. Difficulty of swallowing also sets in; and a disposition to cram the mouth full occurs at the same time, and requires care. In this last stage, epileptiform seizures are common; they also occur at earlier date; they are probably due to eccentric causes. At all events, enemata relieve them at once.

The mental symptoms bear throughout the characters of imbecility, which gradually increases. Elution of ideas is said to occur; the patient deals in extatic

talk perhaps: millions of angels; glorious palaces; gorgeous scenes; great riches; immense strength; but the figures of speech used are of the most commonplace character—"I'm all right"; "I'm a king", etc. The state of mind is clearly pleasurable. In this respect exhibiting also a parallel to the state of drunkenness; the mind gradually increases in feebleness as long as the power of speech continues to manifest it.

[To be continued.]

NOTES ON

THE ADVANCE OF PHYSIC:

BEING THE ANNUAL ORATION BEFORE THE
HUNTERIAN SOCIETY FOR 1864-5.

By JONATHAN HUTCHINSON, F.R.C.S., Surgeon to the London Hospital; and Assistant-Surgeon to the Royal London Ophthalmic Hospital.

[Concluded from p. 271.]

ARRANGEMENT and system are undoubtedly the very sinews of success, and at first sight it would certainly appear likely that nothing could better tend to economise the labour of medical investigators, and facilitate their researches, than the grouping and classifying of the materials on which they have to work. So far as Specialities do represent a reasonable system of classification, so far they are useful to science. Unfortunately, however, it is quite impossible to carry this far. Our existing specialities are chiefly founded on groupings according to the organ or part affected, and this is most arbitrary and unnatural. Were it possible to classify according to cause, an immense aid in the advancement of our art would be gained in so doing; but this would of course presuppose the diagnosis established beforehand. As it is, however, nature and disease persist in declining to allow the human body to be considered as other than one whole, and constantly permit one and the same organ to suffer under the most varied influences. It is needful, therefore, to the successful specialist, as regards any single organ, that he thoroughly understand all the various causes of disease which may come into operation; and this necessity destroys his character and imposes upon him that general course of study from which he attempts to escape. If he decline this, it is to the injury of his patients, and with peril to the progress of science.

I need but mention the recent discoveries as to the frequency of syphilitic affections of internal organs, or those relative to the influence of the nervous system in the production of a host of organic maladies, to illustrate what is meant. How is it possible for us to have such a being as an oculist proper and exclusive, when the domain of ophthalmic surgery includes syphilis, rheumatism, gout, scrofula, every type of nerve disturbances that can be mentioned, all the varied forms of cachexia, and requires for its satisfactory pursuit a full knowledge of remedies and their uses in reference to the most infinitely varied conditions of the human body? The special part of ophthalmic medicine and surgery is small, and can very easily be taught and acquired; but the general part is large, and necessitates familiarity with the whole range of pathology and therapeutics. Might I not assert the same of each one of the other permitted specialities in succession?

Year by year the specialist loses hold of the general knowledge he acquired in early life, and his range of investigation becomes narrower. Not only is he at a disadvantage in regard to the chance of making additions to our knowledge from the arbitrarily restricted kind of facts which are brought before him, but his

mind itself suffers in its grasp and power. This latter aspect is, I think, one of the most serious which the general subject of specialisms presents to us. In allusion to this evil influence of the division of labour, I may venture to quote the sarcasm of an eloquent modern writer. "We have much studied and much perfected of late the great civilised invention of the division of labour, only we give it a false name. It is not, truly speaking, the labour that is divided, but the men—divided into mere segments of men—broken into small fragments and crumbs of life; so that all the little piece of intelligence that is left in a man is not enough to make a pin or a nail, but exhausts itself in making the point of a pin or the head of a nail." In making these remarks, it is far from my desire to speak only on one side, or to keep out of view the benefits which our science owes to specialists. In the early stage of any department of knowledge, it is almost a matter of necessity that it should be in the hands of a few. But it is the highest privilege of those who thus devote themselves to the reclaiming of new spots of territory to be able, after a while, to hand them over to the commonwealth, to prove that they are now cultivated and well worthy of annexation. Thus, I trust, we may safely regard all our modern specialisms as serving, though somewhat clumsily, purposes which, on the whole, are useful. Already we discern the approaching success of several of those of oldest growth, and which have been most zealously worked. Their victory will be consummated in their own death as such. It is a mistake in observation to suppose that specialists are of modern invention. Never did they abound more than in the early stages of our profession. In the present day they are on the wane. We have got rid of bone-setters, of water-casters, of worm-doctors. The absurd distinctions between physician and surgeon are fast falling before a general recognition that the two departments are essentially one. Our oculists now spurn the title, and the introduction of chloroform has thrown the practice of operative surgery open to all.

It is true we have still not a few special institutions, but the most earnest endeavours of those connected with them are directed to the object of making them no longer necessary, by diffusing the knowledge thence possessed as widely as possible, and by demonstrating its accessibility and its importance to all who practise our noble art. Should any one doubt the correctness of these impressions, I appeal to facts. Two generations ago, the practice of eye surgery was to a very large extent in the hands of quacks, and medical men generally declined to concern themselves with it. Then came a period during which it was undertaken by certain excellent members of the profession, a majority of whom were in a certain sense specialists. The means of acquiring knowledge of these diseases became yearly better and better, and year by year the knowledge of them extended in the profession at large. For one surgeon who understood eye diseases fifty years ago, we have twenty now, and in another ten years the ratio will have doubled.

We now come to the question as to whether the amount of knowledge current in our profession has reached such an extent that it can no longer be profitably mastered by individuals. If we contrast the bulk of the volumes published a few centuries ago with those of the present day, we shall certainly be obliged to admit that the apparent increase is enormous. I hold in my hand *A Discourse of the whole Art of Chirurgerie*, published in 1612, and a remarkably full and instructive volume it is. Before me are the ponderous tomes which comprise the *System of Surgery* of our own times; the contrast is alarming. We must not, however, be misled by appearances. The

possession of large books imposes no duty to read them, far less to commit them to memory. Their chief use is for the purpose of reference, and the larger and more complete the work, the easier and more satisfactory such reference is. A rich literature, instead of embarrassing, makes a subject much more easy. There is no doubt that the details of knowledge have enormously increased, but *pari passu*, have also the facilities for becoming familiar with them.

Two hundred and fifty years ago, "Mr. Peter Lowe, Scottishman, Doctor in the Faculty of Chirurgerie at Paris," wrote thus: "If we consider the sentence of the divine philosopher Plato, that things good are difficile, there is nothing harder than chirurgerie, the which will occupy a man all his life time to seeke out the nature of things pertaining thereto." We might adopt the same language still—there is a life's work, but there is nothing which need cause despair. May the day be far distant when any number of those who profess medicine as a practical art shall consider it needful to shirk, as being too detailed and extensive, a sound knowledge of the sciences upon which it rests.

There is, however, another point of view from which we may consider the recent additions to our knowledge. Instead of merely adding new facts which the mind must master and remember, in the greater number of instances accessions of true knowledge displace cumbrous loads of false theory. The mind is relieved rather than burdened, when once the effort of transfer is accomplished. All true knowledge tends indeed to simplicity—to the discovery of general laws which furnish the clue to a vast number of facts which were previously isolated. In this way the task, whether of acquisition in the first instance, or of retention afterwards, is greatly facilitated. There is not a single science which has not of late years been simplified and rendered more accessible to all.*

I will venture to take one instance; it shall be from a department of surgery which is by many regarded as very difficult. We have lately heard much about the Accommodation of the Eye, and I fear some have been almost tempted to exclaim, with Justice Shallow, "Accommodate! it comes from *accommodo*; very good; a good phrase." A most invaluable work on the *Anomalies of Accommodation and Refraction* has, I believe, been received with but little gratitude by a large proportion of those in whose hands it has been placed. Yet the new light which the splendid researches of Professor Donders and others have thrown upon this subject, far from adding anything to its complexity, have made it so beautifully simple, that it is now within the easy reach of any intelligent student. Not only have they done this, but they have swept aside a host of mistaken theories and conjectures, with which the subject was encumbered. No better instance of the practical fruits of pure science has been given us for many years. There is not the least doubt that this work of the Utrecht professor has already conferred the blessing of accurate sight on hundreds of Englishmen, and that it will in the future do the same for thousands more. The discovery of hypermetropia and of its cause, is a new era in our knowledge and in our practice. Let me briefly illustrate my assertion that the subject is quite simple.

I hold in my hand an opera glass, fitted with certain lenses which refract. If these lenses are too convex or not convex enough, or too near to each other or too distant, the usefulness of the instrument

* See some excellent remarks on this subject, in an article of the Teaching of Languages, in the *Saturday Review* for Jan. 21, 1865.

would be correspondingly impaired; we have an anomaly of *refraction*. In addition to the lenses, however, we find a screw which moves them. This screw is our apparatus of *accommodation*; it enables us to adapt the same instrument for objects near at hand and for those at a distance. If it were out of order, we should have an anomaly of accommodation. Now we have a fair parallel to all this in the eye, with the exception that, instead of the screw, there is a delicate muscular apparatus, by which the lens itself is rendered more convex at some times than others. If I turn this screw in the instrument and put the lenses at a great distance from each other, we have the condition of a short-sighted eye. Lengthening of the eyeball is the one cause of short-sight. It causes the refractive power to be too high for distant objects, and requires correction by a concave glass. It is possible that an eyeball may, however, be too short instead of too long; if so, we have the opposite condition, and must increase the refraction artificially. It is clear that all eyes must arrange themselves in one of the three classes; either they are of normal length, or they are too long or too short. If too short, we have *hypermetropia* or weak sight; if too long, *myopia* or short sight. Neither of these accounts for what is called *long-sight*; this is an anomaly, not of refraction, but of accommodation. By long use I might expect the screw of an opera-glass to become worn and inefficient; and this is just what happens as age advances in respect to the apparatus of accommodation in our eyes. We can no longer make the same eye adapt itself to objects at different distances; our lens has become hard and rigid, our ciliary muscle atrophied. Determined to console ourselves for the loss of our faculty of near vision in the fact that we retain that for distant objects, we call our state *long-sight*; although it is perfectly clear that we have gained nothing whatever. Strange would it have been if old age, which slowly but surely robs us of all, had here conferred any kind of a boon. *Long-sight* or *presbyopia* is therefore no *long-sight* at all; it is simply the loss of the power of accommodation; the screw has got worn and rusty, and will not work. The indication as to artificial aid in each state is clear enough, and it is most melancholy to think how many thousands of times in the past, surgeons and surgeon-oculists have given the strongest opinions against the use of glasses in some of the very cases most likely to be benefited by them.

I have ventured on this digression merely by way of proof, that much of our new knowledge is really the removal of obscurity and the making difficult subjects plain and easy. Numberless other instances quite as good might be cited. The introduction of the microscope, the stethoscope, the ophthalmoscope, as aids in diagnosis, so far from increasing the labour of the surgeon, has wonderfully diminished his work. Ten years ago, the diagnosis of amaurosis was a matter of the utmost difficulty; and to obtain any data for decision as to treatment necessitated very careful study both of the symptoms and of the history of the case. Now, a moment's glance into the eye tells us all. Nor is the use of these instruments difficult to acquire. It is only those who have not learnt them, and who consequently are dismayed at the new terms in use, who fancy that our knowledge is become more complicated and difficult of mastery. To such we may say, in the favourite words of Bacon, "Come close to your work". The mists are due to the distance at which you stand; if you will only take courage, and come close to what you want to see, you will find that it is clear enough.

Thus, then, we return the verdict, that there is no motive for restricting the subjects of medical study,

and that to do so would be to act most prejudicially as regards the true interests of physic. In respect to specialties, we come to an almost similar conclusion; they may be useful as temporary expedients, and for a few individuals, but are most injurious both to our patients and to the progress of our science, if they be made permanent or be developed to excess. That there is great room for improvement in our mode of teaching, all will admit. It ought to be far more of the practical and demonstrative character than it now is; and such it will certainly become whenever our colleges shall alter their modes of examination.

There is, however, one form of specialism which I do advocate earnestly and fully. I am speaking for the advance of physic, and must speak boldly. It is that we should keep close to our own calling, and should not, in the fulness of our energy, aspire to also acquire the experience of politicians, of judges, and of generals. Art is long and days are short; and if we would secure fair time for note-taking, we shall not have much left for newspaper-reading. Not only is a certain time every day occupied to no special profit by those who indulge in this habit; but the mind is kept filled with subjects which far too frequently press themselves into its notice. Anyone who will sternly rid himself of the habit of requiring a daily dose of news, will be surprised to find how easily he does without it, and to what a remarkable extent the mind is left at liberty to engage with other topics. I shall be told that newspapers are contemporary history, and that it is disgraceful to be in ignorance of what is going on around us. To this I must reply, that there is no need to study history in daily detail, and that ignorance of our own profession is much more to be regretted.

In commencing this address, I said that before the Hunterian Society I should claim the privilege of entering upon details, and I have now to do so by making two or three specific proposals. Despite the number of our London societies, I believe that the principle of co-operative research has not as yet been developed to the extent which the interests of physic require. I would beg to suggest the formation of a Society of Comparative Pathology. The diseases of the lower animals have as yet been too much neglected; or, if not wholly so, have been studied by themselves, and not in relation with those of mankind. It is from the investigation of these that we may expect the most fruitful discoveries in the future. Despite the little attention yet given them, we have already reaped most splendid results in this direction. The discovery of a mode of preventing scarlet-fever and measles, in all probability awaits some future Jenner.

I would not propose, however, that such a Society as that alluded to, should restrict itself to the examination of epidemics or exanthemata; but that it should take up the detailed investigation of the various viscera as to their pathological anatomy. Comparative anatomy and physiology have thrown each a flood of light on their corresponding departments; and, if I mistake not, comparative pathology is a yet richer field.

Another society might, I think, be profitably instituted, under the name of Medical Travellers. Its object should be to systemise and collect information on all subjects relating to medicine in foreign parts. We are often at a great disadvantage in comparing our own experience with that of foreign medical men, whether as to pathology or treatment of disease, from the fact that the descriptions are too often furnished by observers who have studied only in one country. Many an obscure point might be cleared up, if the facts concerning it were submitted to the same

eye. Such a society or club might do excellent service in sending out small deputations with special duties allotted to them, and thoroughly informed beforehand as to the kind of facts needed. It should take cognisance, not only of foreign schools, but also of remote countries where, as yet, but little in the way of medical investigation has been done; it should appoint corresponding members in all parts of the world, to whom queries might be sent on any subject on which information was required.

Such an institution would make use of the services of the hundreds of zealous young surgeons who yearly leave our shores for distant parts; many of whom would be only too glad to obtain information beforehand as to the kind of service which they might be able to render. Want of system, and of previous preparation for our tasks, leads to the waste of an enormous amount of energy and zeal. It was well remarked, I think by Dr. Johnson, that we bring back from foreign travel in proportion to what we take out with us; and this is especially applicable to medicine.

In order to observe well, and particularly in order to make the most of short chance opportunities for observation, we must be previously well informed as to what we ought to notice.

Then, too, such a society would make use of the summer vacations of its members. Much good is already done in this way; but it is in a desultory manner. A vacation would be none the less enjoyable, because it had associated with it a subject of scientific interest. Its zest would rather be increased. A journey to Bergen and its adjacent fjords to investigate leprosy, would be just as health-giving as one for fishing; and to most of those who are accustomed to enjoy work, I unhesitatingly assert that it would give more pleasure. I am no believer in the necessity for absolute change of mental occupation, provided the occupation be one in which the mind takes pleasure. On the contrary, the attempt to eject altogether such a subject is attended by a certain degree of pain. I cannot help mentioning the very important contributions to medical literature which our late Vice-President, Dr. Peacock, has repeatedly made as the fruits of summer excursions; and the excellent *Essay on Alpine Climates*, which Dr. Weber has just supplied from a similar source.

The strides which physiology and pathology have recently made suggest to us, that it is time that the subject of therapeutics should receive more systematic attention. For long it was felt by most that this department, although of primary importance, must of necessity wait until those just mentioned had established themselves on a wider and firmer basis. We have emancipated ourselves from one system of empirical drug-giving, and are in no haste to impose another. Yet the time must come when a Therapeutical Society will be both feasible and necessary. Whether that time is come as yet, I must leave for others to decide.

Another direction in which I think aid might be given to the progress of our art, is by the more careful study of symptoms as they occur in ourselves. Sydenham has given us the example of recording his own case; and many physicians have enriched medical literature by similar contributions. I do not, however, intend so much to recommend the record of rare examples of disease when, unfortunately, we may chance to be their subjects, as that we should habitually study in ourselves what are deemed minor symptoms.

The phenomena which attend little and apparently insignificant ailments are often of the utmost interest and mystery as regards their physiological explanation. It is exceedingly difficult to compel our-

selves to attend to these when they are brought before us by others; but when we ourselves are the subjects of the mysterious ache, it is easy enough to get the mind to speculate on its cause. So far from leading to hypochondriacism, the act of doing so will amuse many an hour of illness and pain. There are symptoms which would be incredible did we not ourselves experience them; and, as one instance, I may mention that there would no longer be any scepticism as to what are called reflex inflammations, did medical men sufficiently study the phenomena of disease subjectively.

Amongst the hindrances to the more rapid improvement of medicine, we must not omit to mention our great enemy. Jealous, it may be, of our puny efforts to dispute his sway, Death does his utmost to retard our science. The necessity which compels each generation to transfer its knowledge to a successor and to yield its place, acts prejudicially on all progressive sciences, but on none more so than on medicine. Just when a man has succeeded in mastering all preliminaries, when he is becoming used to the tools with which he is to work, his personality comes to an end, and another must take his place; under the necessity of beginning anew; and again, in time, succumbing to a like fate. So much of medicine is a matter of experience and memory, and admits of being transferred only with the greatest difficulty and loss, that this law of death is felt most injuriously. In any one of the more exact sciences its influence is much lighter. To us it is a matter of constantly recurring regret, as we hear of the removal of one after another of our teachers or *confrères*—the amount of empirical knowledge which is thus lost to the world. Men who, whilst living, were invaluable, depart, and but too often leave no heritage. I do not speak so much of premature deaths, although the loss which science sustains in this direction is very great; but I prefer for the present to consider simply the working of that great law under which we are all compelled, sooner or later, and it may be not until what is called old age, to yield our places to younger and less experienced successors. Let us think for a moment of how science might advance if its experts could but enjoy a double tenure of life. Where would our knowledge have reached by this, had we still amongst us the trained intellect of Hunter, which retaining its early vigour, might be supposed to have become with each discovery better fitted for future ones.

The pursuit of science may indeed be compared to the ascent of some inaccessible mountain summit. Each one who attempts it improves the path somewhat, and cuts out a few fresh steps at the top for his successors, but the greater part of life is occupied in gaining the spot where others left off. Each adventurous climber gets a little higher than his predecessor, but each one has to begin at the bottom, and there is consequently no very rapid gain. Imagine how it might be if one man were permitted to double his hold on life, and having reached the highest point yet attained, were allowed another life in which to prosecute his advantage. As a practical commentary on this, we may note that nearly all the fathers of our art have been men who enjoyed great vigour of animal health, and who attained to a good age. The discoveries which enrich an empirical science are not to be made by us whilst in the stage of youth. Harvey and Jenner were both of them beyond middle age when their great discoveries were made; and Hunter was in the full activity of scientific investigation up to the time of his death, after forty years of work. Fully admitting that it is in vain to hope for the suspension of a natural law, or waste our time in longing for a race of patriarchs of medicine, I still

think that some important practical conclusions may be based upon this consideration.

The problems before us clearly are, as regards this matter, how best to economise our own lives, and to facilitate our successors' easy attainment of the vantage-ground for which we have fought. In the aim to protract our individual periods of industry, with the systematic object of gain to science thereby, we have two points to keep in view. It is not necessary only that a man should live long in years; for, in that case, it may happen that he outlive his capability of usefulness, and present what Bacon has wittily termed the melancholy spectacle of following, whilst yet living, in the funeral of his own reputation. It is requisite that, not only shall he secure many years, but that he shall retain the mental vigour of middle age, and, as far as possible, the zeal and enthusiasm of youth. In reference to the good of science, surely we do not sufficiently consider, and in a certain sense cultivate and train, our own bodies and minds. We ought to regard our own minds just as we should the mechanism of a valuable instrument. We might compare them to microscopes, and certainly they are as well worth taking care of. If the lenses get dusty, if the wheels are out of order, if the light be removed, or the mirror broken, the value of the once splendid instrument is at an end. Did we attain the habit of looking upon ourselves objectively, of estimating our own value just as we do that of our microscopes, a great gain would follow. We should learn the absolute necessity of the utmost care of its every part, if the instrument is to last long and to do good service. I speak, of course, of the mind as an intellectual engine, not of it in its moral relations. Looking upon ourselves as lenses of greater or less power for the concentration of the scattered rays which surround us, we shall clearly appreciate the duty of keeping the glass bright.

Great, however, as is the detrimental influence of the shortness of individual life upon the progress of a science which must be built upon individual experience, there is another form of death yet more widely prejudicial. I allude to that most melancholy subject of the too early failure of the appetite for work. Men who, during the first twenty years of their course, have given high promise, suddenly experience a lapse of energy; and, although they still continue to live as most useful members of society, producing, in many instances, plenty of "fruit," they yield no further accessions of "light." In this direction, the losses to science are beyond estimate. The very men who are most capable of advancing her interest, desert her cause; and they who have painfully toiled up the preliminary heights, content themselves with a Pisgah view of the promised land, and decline to enter it. If we ask how Hunter, Sydenham, Harvey, Cooper, Brodie, did so much, we shall find that it was not only by living long, but continuing to work up to the very end of life. The necessities of the case demand a long day's work, begun early and continued until light fails. No doubt, great difference exists in men and races of men as to the endurance of long protracted work; and to this consideration we may perhaps refer in explanation of the splendid array of names which Scotland has given to the lists of science. It is well known, that no Scotchman is of age before thirty. Nor would I for a moment be understood to advise the exaction of task labour out of any one. If the energy have really left us, if the appetite be gone, if work have become a weariness and not, at least in some degree, a pleasure, then it is time that we should rest. No good would come of contending against nature. Whilst, however, we freely admit that science could gain nothing by forced contribu-

tions, it is a subject well worth our consideration, how the evil alluded to may best be met. How best can the human mind be kept resilient, youthful, energetic, through the longest series of years? I commend this problem to a profession which has for its special care the physical welfare of the community.

One of the ablest of modern observers has expressed so vigorously the importance of this subject, that I cannot deny myself the pleasure of quoting the passage.

"The real animating power of knowledge is only in the moment of its being first received, when it fills us with wonder and joy..... That man is always happy who is in the presence of something which he cannot know to the full, which he is always going on to know..... Once thoroughly our own, the knowledge ceases to give us pleasure. It may be practically useful to us, it may be good for others, or good for usury to obtain more; but, in itself, once let it be thoroughly familiar, and it is dead. The wonder is gone from it, and all the fine colour which it had when first we drew it up out of the infinite sea. All men feel this, though they do not think of it, nor reason out its consequences.

"They look back to the days of childhood as of greatest happiness, because those were the days of greatest wonder, greatest simplicity, and most vigorous imagination. And the whole difference between a man of genius and other men, it has been said a thousand times, and most truly, is that the first remains in great part a child, seeing with the large eyes of children, in perpetual wonder, not conscious of much knowledge—conscious, rather, of infinite ignorance, and yet infinite power; a fountain of eternal admiration, delight, and creative force, within him, meeting the ocean of visible and governable things around him."

In reference to the future prospects of physic, we must note, with some regret, the comparative neglect in the present day and in this country, of the study of medical biography and medical history. Surely, there is no knowledge so likely to enhance our zeal, as familiarity with what has been done, and what left undone for us to do, by those who preceded us. Their earnest work is an example for us, and their successive advances constitute the best kind of encouragement we can have. As the young soldier revels amid the narratives of military prowess and daring, so should the students of physic delight to contemplate the heroism in another sphere of men like Haller, Hunter, and Harvey. It is a bad sign as to our estimate of our art itself, if we do not learn to revere its seers. I do not speak of a slavish reverence for the past; that is the very last impression which an earnest mind would receive from the study of medical biography. I allude rather to that feeling of affectionate respect which springs from familiarity with the lives as well as the works of departed great ones. A feeling in which we may come almost to regard them as literally our fathers and we their sons, in which we feel as if we had inherited direct from them a glorious patrimony and an honourable name to be guarded as we should guard the paternal acres or the family escutcheon.

Nor are the lessons from a study of the history of medicine less beneficial than those of medical biography. It shows us how progress has been made, under what drawbacks, with what hindrances; how it has been achieved by unflinching perseverance, and not by erratic flashes of genius. It shows us how one fact has been added here and another there; how error was at first mixed even with the greatest discoveries, and how little by little it was eliminated, until the truth at length set in the light of many minds shone

clear and bright. It shows us, also, how science has too often received detriment from the moral weaknesses of her votaries; it paints in their true colours, as the giant enemies of progress and of truth, the vices of envy, selfishness, and greed of gain. Above all, it encourages us under those impressions of weariness and disappointment which must at times steal over the minds of all of us. It shows us what has been really gained; that the barren moor of the old maps is now a cultivated farm; that morasses have been drained; that roads have been planned; and that a country once an almost impassable wilderness is now of easy access to all.

I have ventured to hint, that our profession might with advantage neglect politics and newspapers; and I would now suggest to those who require occasional amusement and change of thought, that they should seek these, not in the pages of the sensation novel, but in the original documents of medical history. Do not take up any modern synopsis of old opinions; but read the books themselves in all their quaintness and peculiarity. They contain much valuable information, and in human interest they far exceed a large proportion of the productions of our modern press.

In concluding these remarks, I may perhaps be allowed to add that, although I have insisted throughout on the importance of earnestness and of close application to our own work if we would do anything for the advance of physic, that nothing is further from my wish than to advocate asceticism or painful labour. My assumption has been that there are few higher pleasures than those which we earn in the pursuit of duty, and which come as the reward of successful work. I have endeavoured to show that the advance of science depends almost as much upon the physical as on the mental vigour of those who devote themselves to her cause. In a certain sense I have urged what has been fairly called the duty of delight, advocating frequent resort to the sea, the mountain, and the moor, as the only means by which we can expect to maintain that healthy tone of body and mind which is so essential to scientific success.

It remains but to express a strong confidence as regards the future of our profession. Never perhaps had it brighter prospects than at present. Never did discoveries follow each other with greater rapidity than they have done during the last quarter of a century. Never, probably, were there more earnest workers, and certainly at no former period had we such splendid tools. Still, however, it is most needful that we stimulate our minds by reminders of the comparatively little that has been accomplished, and the much that is possible.

"It appears to me," wrote large-brow'd Verulam, "it appears to me, that men know neither their acquirements nor their powers, but fancy their possessions greater and their faculties less than they are. Whence either valuing the received knowledge above measure, they look out no further; or else despising themselves too much, they exercise their talents upon lighter matters without attempting the capital things of all. And hence, the sciences seem to have their Hercules pillars which bound the desires and hopes of mankind."

Let us trust for the advance of physic, that her disciples may avoid these errors; that they may recognise clearly that there are no limits to the possible extension of our science, that estimating fairly our own powers, opportunities, and responsibility, we may go forth

"Strong in will
To strive, to seek, to find, and not to yield."

CASES OF SKIN-DISEASE.

By JOHN BARCLAY, M.D., F.R.C.P., Leicester.

I.—SIMPLE ALOPECIA.

In the report of the meeting of the Liverpool Medical Institution, at p. 204 of the current volume, Dr. Balman's remark is quoted that "the records of medicine supply but a very few examples of the complete loss of hair." I would, therefore, add one to the list.

A. B., master printer, was seen on Feb. 24, 1853. He was aged 24, married, steady, never had syphilis. In the middle of September 1852, he noticed his hair falling off, not in patches. He could give no possible reason for it, except that he had been closely confined and working hard.

I found him a robust, very active young man. His hair had been dark brown; he was now absolutely hairless, except one or two eyelashes. The scalp was perfectly smooth; and with a magnifying-glass, no trace of hair-follicles was to be seen. The eyebrows and eyelashes were gone; also the hair on the pubes and in the axillæ; as well as the downy hair all over the limbs. He was perfectly smooth over the whole body. There was no heat of skin; no unhealthy appearance; no patches; but a simple absence of hair.

I kept him under treatment with tonics for some time, and applied various stimulating lotions and unguents to the scalp; but with not the slightest effect. The one or two eyelashes left soon disappeared; and his only inconvenience seemed to result from their loss, as he had always slight palpebritis.

He now—twelve years later—is in exactly the same state as when he left off treatment, and in perfect health.

I have met with one other case of complete and total baldness in an old gentleman suffering from calculus in the kidney; but, as he was 81 years of age, it may be considered as merely an extreme degree of the loss of hair incidental to old age.

II.—PSORIASIS OF TWENTY YEARS' STANDING CURED(?) BY ARSENIC.

In church, on Christmas-day 1863, some hundred miles from home, I observed a young lady whose face and neck, so far as I could see, were covered with red-looking scars and scaly patches of lepra or psoriasis.

I was afterwards told, when expressing my sympathy for such a sufferer, that the poor girl had always been so—a martyr all her life. Of course, in conversation, I inquired if every means of treatment had been exhausted, and learned that the family was of the strictest sect of the homeopaths. My objections were wanting in neither loudness nor depth; they reached the parents' ears, and the result was, an inquiry of me, by letter, whether I considered there was any chance of cure by medicine; and further, whether I would undertake to try that chance. In spite of the impossibility of communicating except by letter, I did not hesitate to do so; for I felt that it would be such a triumph for legitimate physic, such a satisfaction even to myself in these days of doubts and scepticism—of heresies, among which I rank the do-nothing theory as about the worst—to see the power of medicine exerted and evidently (though, perhaps, not logically) demonstrable. I only bargained that no remarks should be made on my want of success for twelve months.

The history I gathered was this. C. D., aged 21, was a strong, healthy, robust young lady, with not a single symptom of disease or derangement of any kind, except her one misery. There was said to be "scrofula" in her father's family. The eruption ap-

peared when she was cutting her first double teeth, and had continued to increase, and of late years had been a source of much distress. It disappeared once for a few weeks, at seven years of age, after a long course of sarsaparilla and cod-liver oil by the seaside; but it soon returned worse than ever. At the age of 12, she had measles; and then it again disappeared of itself for a few weeks, and she was "lame in her feet" until the eruption came out again in all its virulence. "Besides the face, the eruption spreads over neck and shoulders, arms, and legs; and on the knees and elbows thickens very much, and comes off in large dry scales, and then gathers again." It was, therefore, nine years since there had been any mitigation of the disease, and twenty since it first appeared.
